For the defendants, it was stated that the delay in the installation of the lifts was not due to any delay in building operations, but to plaintiff's inability to obtain the lifts from the manufacturers in Milan. With regard to the other two lifts, the defendants would have been willing to pay a higher price, but they would not consent to alter the terms of payment as suggested by the plaintiff, and the order went elsewhere.

The Deputy-Judge held that plaintiff had been delayed by the building operations, but he was not satisfied that a binding contract had been made for the latter two lifts to be supplied at a higher price. The plaintiff was entitled to damages for breach of the original contract, and he awarded him £75. To this was added £60 for work done, and £38 4s. 6d. for items set out in the particulars of the claim, making £173 4s. 6d., together with costs.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

11,706. "Induction reaction motors." Sangamo Electric Co. December 18th, 1923. (226,479.)

21,345. "Automatic telephone exchange mechanism." A. Watts. September 10th, 1924. (247,243.)

23,814. "Induction motors with phase compensation." Deutsche Werke Akt.-Ges. October 8th, 1923. (223,234.)

23,927. "Telephone systems." Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd) (Western Electric Co., Inc.). October 9th, 1924. (247,247.)

23,955. "Induction electricity meters." S. Z. De Ferranti. October 9th, 1924. (247,248.)

25,068. "Electric resistance furnaces." G. E. Taylor and Electric Furnace Co., Ltd. July 20th, 1925. (247,254.)

26,483. "Thermionic valves." Radions, Ltd., and H. J. Osborn. November 6th, 1924. (247,260.)

26,537. "Electrically illuminated advertising apparatus." Scintillating Sign Co., Ltd., and H. S. Coleman. November 6th, 1924. (247,262.)

26,899. "Charging of electric accumulators." J. W. Burleigh and Rotax (Motor Accessories), Ltd. November 11th, 1924. (247,279.)

26,912. "Starters for electric motors." British Thomson-Houston Co., Ltd., G. O. Watson, and W. L. Wise. November 11th, 1924. (247,280.)

26,914. "Loud-speaking telephonic apparatus." E. A. Graham. November 11th, 1924. (247,281.)

27,071. "Electric fuses." C. W. Cox. November 13th, 1924. (247,289.)

27,146. "Rheostats." Lissen, Ltd., and R. P. Richardson. November 13th, 1924. (247,294.)

27,227. "Production of electric oscillations." Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). November 14th, 1924. (247,297.)

27,325. "Magnetic cores or other magnetic bodies, and the manufacture thereof." Callender's Cable & Construction Co., Ltd., and J. F. Watson. November 15th, 1924. (247,301.)

27,419. "Ignition apparatus for internal-combustion engines." F. H. Royce. November 17th, 1924. (247,304.)

27,659. "Ignition devices of internal-combustion engines." F. H. Royce. November 19th, 1924. (Addition to 198,014.) (247,306.)

28,063. "Electric switches specially applicable to electric motor starters." F. B. Cox. November 24th, 1924. (247,317.)

28,882. "Electron discharge devices." Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). December 2nd, 1924. (247,331.)

29,335. "Electric signalling systems." Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). December 6th, 1924. (247,333.)

30,904. "Apparatus for heating liquids by electricity." A. Torriani. December 23rd, 1924. (247,345.)

1925.

315. "Electric drive, more particularly for hoisting apparatus." Schindler and Cie. August 29th, 1924. (239,158.)

829. "Selecting switches for use in telephone systems." Siemens and Halske Akt.-Ges. and F. Döring. January 10th, 1925. (247,350.)

1,490. "Coil holders for wireless receiving sets." A. J. G. Robinson. January 17th, 1925. (247,360.)

1,734. "Sound-amplifying horns." G. G. De Andia-Yrarrazaval. January 20th, 1925. (247,361.)

2,282. "Variable condensers for use in connection with wireless telephony and telegraphy." J. B. Collingburn. January 26th, 1925. (247,365.)

3,637. "Means for balancing telephone cable circuits." A. H. de Voogt. October 29th, 1924. (Addition to 225,229.) (242,217.)

5,760. "Electric cables." Callender's Cable & Construction Co., Ltd., and S. J. Bryce. March 3rd, 1925. (247,401.)

6,609. "Aerial masts for wireless signalling." J. Smales. March 11th, 1925. (247,410.)

7,423. "Crystal detectors for use in connection with wireless apparatus." G. H. Comery and H. Rose. March 19th, 1925. (247,413.)

7,972. "Switchgear for automatic reversing electric motors." J. G. Stirk. March 25th, 1925. (247,419.)

8,751. "Means for illuminating the dials of switchboard instruments." Rotax (Motor Accessories), Ltd., T. Sparkes, and E. Hill. April 1st, 1925. (247,423.)

8,911. "Testing and calibrating apparatus for electric meters." F. H. Rogers (Zera). April 3rd, 1925. (247,424.)

9,840. "Spring clip for electrical conductors." National Carbon Co., Inc. September 17th, 1924. (240,120.)

12,985. "Vacuum tube arrangement." Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd.) (Western Electric Co., Inc.). May 18th, 1925. (247,440.)

14,683. "Electrical connector boxes." Soc. Genevoise D'Instruments de Physique. June 28th, 1924. (236,186.)

14,790. "Electrically-heated irons." H. B. Jackson. June 8th, 1925. (247,442.)

15,285. "Compensation of asynchronous machines by shunt commutator machines connected in cascade." Sachsenwerk Licht-und Kraft-Akt.-Ges. December 30th, 1924. (245,410.)

15,597. "Electron discharge apparatus and circuit arrangements therefor." British Thomson-Houston Co., Ltd. July 11th, 1924. (236,911.)

16,660. "Electric heaters for heating liquids." L. H. Veronneau. June 29th, 1925. (247,454.)

18,031. "Electric arc-welding apparatus." Harms & Co. December 20th, 1924. (244,703.)

19,054. "Thermostatic devices." Metropolitan-Vickers Electrical Co., Ltd. August 14th, 1924. (238,532.)

22,545. "Wireless signalling." Soc. Française Radio-Electrique. September 10th, 1024. (239,856.)

22,996. "Protective arrangements for alternating electric current systems." International General Electric Co., Inc. September 20th, 1924. (240,157.)

24,417. "Sparking plugs for internal-combustion engines." C. J. E. Isaksson and H. T. Tillquist. July 2nd, 1925. (247,491.)

28,657. "Electric power-factor indicators." H. Müller. November 13th,

Teachers' Vacational Courses.—Arrangements are being made by the Board of Education for short instructional courses in engineering science and electrical engineering for teachers in recognised technical schools, to be held at Oriel College, Oxford, commencing July 17th next. Application to attend the courses must be made to the Board of Education, on a special form, before March 26th.

The

Electrical Review

VOL. XCVIII. MARCH 19, 1926. No. 2,521.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

National Electricity Supply.

AT last we have before us the Electricity (Supply) Bill, 1926, which is to bring about a new era in the history of the electrical industry in this country, and thereby to assist in restoring prosperity to the whole community. As we have previously indicated—and as Mr. Stanley Baldwin himself admitted in his forecast of the measure—a cheap supply of electricity in itself is not a panacea for our industrial disorders; but that it should, and will, play a leading part in re-building our constitution and hastening the return of healthy conditions we have no doubt whatever, provided that its development and use are cultivated on sound commercial lines. Preliminary utterances on the part of those acquainted with the proposals that were laid before the Government led us to fear that costly enterprises would be undertaken which, however advantageous they might prove to the next generation, held out no prospect of material benefit in the immediate future, and our fears were shared by many prominent members of the electrical profession; we are glad, therefore, to find that the reality is less alarming than the anticipation. In many respects the provisions of the Bill are admirably conceived, and may be cordially welcomed, though there are certain features which will require the most careful and critical examination. That this will not be lacking is evidenced by the Prime Minister's desire to obtain the second reading before Easter, so that there may be ample time for the detailed investigation of the proposals in Committee which he clearly foresees.

The outstanding feature of the Bill is the creation of a "Central Electricity Board" for the whole country, whose principal function is to buy and sell electricity on the most advantageous terms; to enable it to do this effectively, it is to be empowered to exercise complete control over the generation of electricity at certain "selected" stations, which must either be extended by the owners to comply with its requirements or sold outright to the Board. The owners of stations who consider the Board's requirements "unreasonable" are granted the right of appeal not only to the Electricity Commissioners, but, in this case only, beyond them to the Railway and Canal Commission. New stations will be erected by arrangement with the Board, or if this cannot be done, the Board will take the matter into its own hands; but in any case, the Board is not to operate any station, new or old, unless there is no alternative.

Having at command an unlimited supply of electricity, the Board must provide facilities for retailing it; for this purpose it is to prepare a scheme, and after it has been confirmed "as respects any area," to construct transmission lines connecting the "selected stations with one another and with the systems of authorised undertakers in accordance with the scheme *so far as it relates to that area.*" That is entirely commendable. The words which we have italicised imply that the crude idea of covering the country with a "gridiron" of high-pressure mains, as a first step towards cheapening electricity (save the mark!), put forward by Lord Weir's Committee, has been prudently pigeon-holed, and that area development on normal lines has taken its place—for which relief we are grateful. The same inference can be drawn from the clause regarding the standardisation of frequency, which is permissive only, and says that the Board "may require" undertakers to alter the frequency "if and so far as such alteration is required" under the scheme, or to effect such standardisation as it "may think expedient." There will not, then, be a storm of standardisation to afflict the country, at a time when economy is a first necessity—be it remembered that the abolition of the frequencies of 25 and 40 cycles is needed solely for the purpose of interconnection, and that the outlay is wholly unremunerative in itself. Further discussion of that question must be deferred for the moment.

Our next point concerns the sale of the electrical energy thus obtained and distributed to authorised undertakers. The latter need not take it if they can generate more cheaply themselves, and thus the interests of consumers are safeguarded in areas already enjoying a cheap supply—cheaper, in some cases, than the Board can hope to offer. The owners of the "selected" stations appear to be at a disadvantage, in that they have to sell to the Board the whole of their output at the cost of production, and repurchase energy for their own undertakings at a price which appears almost certain to be higher, for it has to bear "a proper proportion of the Board's expenses"; alternatively, the price is the Board's general tariff, which is framed to cover its expenditure plus capital charges, with a margin. The conclusion seems inevitable that the cost will be increased—unless an improved load factor results from the operations of the Board, more than sufficient to wipe out the additional burdens. To soothe the owners' natural apprehensions, they are protected for the first seven years against paying more than the cost that they would have incurred without the Board's assistance.

That such an improvement in load factor will be obtained is the argument that has been put forward to justify the adoption of this "middle-man" system. We sincerely hope that it will prove well-founded, though there is little evidence before us to that effect. The success of the scheme is largely dependent upon this consideration. It is a case of "making the best of a bad job." Because past legislation has thrown electricity supply mainly into the hands of local authorities, amalgamation of the distributors, which would have been possible if they had been companies, cannot be effected; nor will the local authorities permit companies to take over their undertakings. Had the conditions been otherwise, companies could have been formed to generate electricity in large power stations, transmit it to the various townships, and distribute it to the consumers, without any middleman. This would have been the most satisfactory and business-like method of dealing with the problem, and is not only in full force abroad, but is also practised in this country most successfully by such power companies as have been able to come to terms with the local authorities in their areas.

An important provision is that which enables the Electricity Commissioners to require undertakers who refuse a supply in bulk from the Board to reduce their charges to consumers by the amount by which their cost of production exceeds the bulk price offered by the Board. This should result in the closing of inefficient generating stations, as the alternative, in the case of a municipality, is a call upon the rates; the case of a company does not arise, as no company would refuse a cheap bulk supply.

The Central Electricity Board is to be deemed to be an "authorised undertaker" within the meaning of the Electricity Acts in many respects, but will also fill the office of a "super" Joint Electricity Authority, with all Britain for its District, as we surmised in our issue of January 29th. So far as it follows the policy of developing electricity supply in the existing Districts it will be working on the lines which we have advocated. It is not clear, however, that it is under any obligation to extend the supply into areas at present unprovided with electricity—yet it appears that the rural demand is largely relied upon to improve the load curve and to produce the resulting economies which are to pay for interconnecting mains, the standardisation of frequency, and the expenses of the Board. The scheme is incomplete, and the Bill will probably emerge from Committee materially changed from its present aspect. Whilst there are many points in it which we have not here touched upon, such as the nature, constitution and authority of the Board, a matter which is giving rise to criticisms in important quarters, there are also serious omissions, and we especially regret that neither railway electrification nor the question of improved facilities for wayleaves is so much as mentioned in the Bill.

The South American Market.

In this issue we review two reports issued by the Department of Overseas Trade, both relating to South American countries. In the search for new outlets for our goods and the endeavour to strengthen established trade relations, there seems to be no doubt that, apart from the British Dominions, Latin America is the market which should receive the closest attention.

Argentina is an old and important customer for British goods, but it is not sufficient to rely on this fact to sell more of our products. Competition is very keen—keen enough to overcome all sentimental attachments, and if we are to retain and strengthen our connection with Argentina, continued study of the country and its people is essential. For this reason we welcome Mr. Chalkley's report, which brings before British traders some ideas and suggestions for meeting the competition of United States and Continental producers. In some respects the market is an easy one; Argentina is one of the countries which, being least hit by the war, was able to recover sooner, and the knotty problem of long-term credits is not met with there. In the electrical branch, in particular, Great Britain is not unfavourably placed, and in two of the main sections supplied more in 1924 than in the preceding year.

With regard to Brazil, the position is not so satisfactory. There the price factor appears to be more in evidence, and although the sterling merits of British goods are recognised, they are hard put to it to combat the competition of Continental products. The existing conditions in Brazil also raise the question of long credits. One important matter mentioned by Mr. Hambloch is the fact that the most important contracts emanate from the Federal and State Governments and municipal authorities. It is pointed out that unless a firm has an agent on the spot, such opportunities are almost certain to be lost. It is stated that at present Great Britain supplies only about 14 per cent. of the electrical goods which Brazil imports, but intense American and German competition has to be dealt with if this quota is to be increased.

Bringing Electricity Within Reach.

Although of some importance from its position in the Port of London, as well as from an industrial point of view, Gravesend is a modest town, and does not often figure in the newspapers. Recently, however, it has made a move which should bring it into greater prominence in electrical circles. This is the introduction of a system of charging for electricity which is one of the most favourable to electrical development that we have heard of. It is

a rateable-value tariff requiring the payment in advance of 2½ per cent. of the assessment of premises per quarter, the "unit" charge being ¾d. To realise the value of the new system, it has to be borne in mind that it is an "overall" method of charging for lighting, heating, cooking, &c., and there are no conditions as to the use of appliances, &c. So far we have come across only one undertaking with a similar system—Watford—but here the fixed charge of 2½ per cent. only applies during the summer quarters; it rises to 5 per cent. in the winter. The lowest flat rate charge, for heating and cooking only, in the Greater London area (which is fairly representative of the country as a whole) is 1d. per kWh, but the new Gravesend charge beats this when the consumption, in the case of a house with an average assessment, rises above 400 kWh per quarter. The latter figure is easily attainable where heating and cooking are done electrically. In this particular town the price of gas is very high, and if the new electricity tariff is given sufficient publicity—backed up by demonstrations of cooking, &c.—the Electricity Department should be overwhelmed with applications for supply. Plant extensions are already in hand, and more should soon be required. We congratulate the Gravesend Electricity Committee and its engineer (Mr. C. F. McInnes) upon their determination to provide a really "cheap and abundant supply" of electricity, and call upon other undertakings to take a similar forward step. We have always said that it could be done, and we are confident that the policy will be justified by the results.

The North-East Coast Counties.

In our series of maps showing the present position of electricity supply in this country, this week we reach the counties of Northumberland and Durham, which include almost (but not quite) the whole of the area served by the Newcastle-on-Tyne and Associated Companies. This is of exceptional interest at this time, when the Electricity (Supply) Bill is before the House of Commons, for it is an example of the development which can be brought about by the operations of companies endowed with wide powers over large areas. As we point out in our leading article, co-ordination of this type is not practicable where the business is in the hands of municipal authorities. In this area the annual consumption of electricity is about 500 kWh per head of population; in the Metropolitan area, in spite of the large demand of the electric railways, the consumption is less than half as much. Until recently the companies in the latter area have been prohibited by Parliament from combining, and thus although they are responsible for two-thirds of the output of electricity, they have been in no better case in this respect than the municipalities. Under the new conditions, amalgamation is rapidly taking place, and we hope in a very few years to see a vast improvement effected in London and the home counties. "Electrical Freedom," the contractors' slogan, might equally serve for the electricity suppliers.

In other districts besides Tyneside, where the power companies have enjoyed a fair degree of freedom, as in Yorkshire, the North Metropolitan Company's area, and on Clydeside, rapid progress has been made.

It will be observed that in the North-Eastern area there are very few power stations; those of the companies are sited on rivers, near the denser loads, and no part of their area is more than about 30 miles from one of them. The North Tees station is, we believe, unique in that it is a non-statutory one, owned by a subsidiary company. The average revenue of the companies, per kWh sold, is about ¾d.

The Report of the Coal Commission.

Last week the voluminous report of the Royal Commission on the Coal Industry was issued, and was received with mixed feelings by those interested in this important subject. The most general impression was that the Report afforded abundant material for thought, and that time was necessary to allow of its digestion before it could be adequately discussed. Certainly our compliments are due to the Commission, which, under the able chairmanship of Sir Herbert Samuel, has carried out a most thorough and impartial investigation into the economic position of the industry and has embodied the fruits of its labours in a treatise of some 300 pages which deserves the highest commendation.

We are glad to find that the Royal Commission definitely turns down the proposal that the mines should be nationalised, and considers that the industry should remain under private enterprise; it recommends, however, that the mineral rights should be acquired by the State and administered by a Coal Commission under the Secretary for Mines. Another important recommendation is that many of the small mining properties should be amalgamated, if possible by voluntary action, but in cases where unreasonable opposition is met with, by compulsory transfer.

Research should be largely extended, and a closer connection between mining and the allied industries is advocated; the Commission holds that the development of electricity supply under the new proposals of the Government should be closely co-ordinated with the generation of electricity at the mines, and proposes the establishment of a National Fuel and Power Committee which should maintain a constant survey of the heat, power, and light requirements of the country.

The most emphatic decision of all is that no further subsidy shall be allotted to the industry, which must stand upon its own economic basis.

Railway Electrification.

An important announcement, which appears to have escaped the attention that it deserves, was made by the Chairman of the Southern Railway in his speech at the annual general meeting—namely, that the overhead contact system on the Central, or Brighton, section of the railway, is to be scrapped, in order to bring that section into line with the Eastern and Western sections, which are both operated with direct current at 600 volts, third rail. While it is undoubtedly awkward to have a non-standard system sandwiched between two which are standard (as recommended by the Advisory Committee of the Ministry of Transport six years ago) we confess to some feeling of dismay that a system which has given satisfaction, which only recently has been considerably extended, and which is similar to that widely adopted in other countries, should be abolished in favour of something not very different from the first efforts in electric traction. We hope it is not to be inferred that the Southern Railway has abandoned all intention to proceed with main-line and long-distance electrification, for to confine electrical operation to suburban traffic would be to derive from it less than half the benefit of which it has been proved capable. As we have pointed out, it is very important that we should have at least one single-phase railway in operation in this country, in order to assist our manufacturers in developing and improving the design of a.c. motors, and we greatly regret the prospect of the adoption of a low-pressure system which, however well adapted for suburban service, is certainly not suitable for main-line operation.

The Report of Lord Weir's Committee.

Simultaneously with the issue of the text of the Electricity (Supply) Bill, the Report of the "Committee appointed to review the national problem of the supply of electrical energy," generally known as the Weir Committee, was published (H.M. Stationery Office, price 2s. net). Although this report was presented to the Minister of Transport on May 20th last year, it has hitherto been withheld from the public, for reasons which may readily be surmised; and in now issuing it, the Minister points out that the Government has not accepted all the proposals of the Committee.

The Report is a very interesting document, and will be reviewed at length in a later issue.

Distilling Plant for Central Stations.

The Kestner Distiller at the Comines (France) Power Station.

By THEODORE RICH.

The question of the use of distillers for boiler-feed work first became a matter of importance in the Navy. The necessity of independence of port water supplies, furthered by the development of the water-tube boiler, made distilling plant a very necessary piece of apparatus in the modern war ship.

Early in the day, when electric power stations began to get out of the *régime* of small belt-driven units, the desirability of good feed water became manifest; nowadays, owing to the increased evaporation per square foot of grate area and heating surface, and the expense and loss of revenue when boilers and economisers have to be laid up for cleaning, let alone the loss of efficiency through the existence of scale and excessive upkeep costs, the necessity for clean and chemically harmless feed water has become more important than ever.

Numerous types of external water-softening and internal deposit-collecting devices have been brought out from time to time, but where the water is really bad, solids usually enter the boiler which are better left outside. At some large installations abroad, for instance at Comines,* distilled water is used not only for boiler purposes, but also for various coolers where a deposit would lead to trouble. It is naturally important that the potential energy in any steam used should be as far as possible utilised. In marine practice, where weight is of great importance, it is usual to evaporate by means of high-pressure steam, which circulates inside tubes bent to a convenient form, the water to be evaporated being outside the tubes; with such a high temperature to start with, the water evaporated per square foot is high, which tends towards the deposition of hard scale; with low-grade steam any deposit on the outside of the tubes is of a soft nature. Further, by the use of high-pressure steam that part of the heat energy in the steam which might have been used for the purpose of running prime movers is lost, and the evaporative capacity of the boilers primarily intended for the generation of power is reduced to that extent. It may be pointed out that this heat if not used for such motive power is not totally lost, as it goes into the water to be evaporated through the distiller tube walls, yet unless the vapour produced is condensed by means of feed-water circulation or similar means by which the heat is recuperated, part of this extra heat will also be lost. A much more efficient system, taken as a whole, is to use bled steam from a turbine or exhaust steam from steam-driven auxiliaries; by this means part of the energy in the steam performs useful mechanical work, the remainder of the heat (with certain small losses) being used for evaporation.

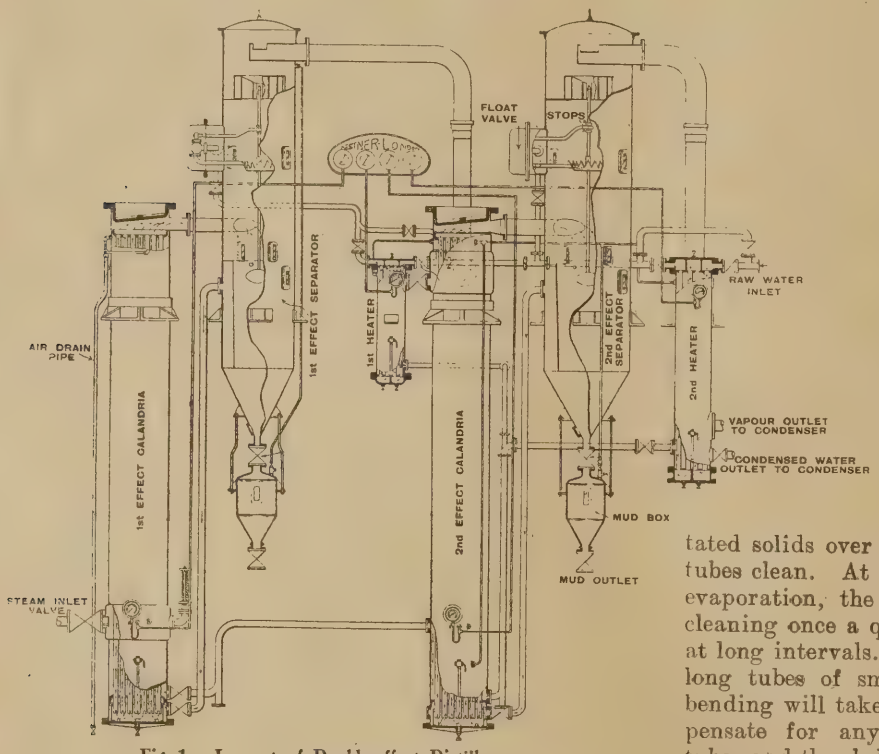

Fig. 1.—Lay-out of Double-effect Distiller.

At Comines the feed pumps are steam turbine driven, the exhaust being turned into the distillers, which are of the Kestner climbing film type. This type of apparatus, which has been used for a number of years for industrial processes, has certain interesting features.

Suppose a long tube in an upright position is jacketed with steam, and water under a low head is introduced into the tube at the bottom; then, provided a certain ratio exists between the length and the diameter of the tubes, the bubbles of vapour as they rise will tend to carry with them a film of liquid up the inner tube walls to the top; if this liquid flows into a separator along with the vapour, the unevaporated water can be returned to the bottom of the tubes again, and an active circulation will be kept up. This is the principle of the Kestner climbing film evaporator. It is found that if vertical tubes 2 inches in diameter and 7 metres between tube plates, about 23 ft. long, are used, a climbing film action will take place under suitable conditions of head. The velocity of the film in the tube is high, and as the film is very thin, the rate of heat transmission is high, and further than this, the high velocity tends to carry the precipitated solids over into the separator, and thus keep the tubes clean. At Comines, where there is multiple effect evaporation, the tubes of the first effect only require cleaning once a quarter, and the remaining effects only at long intervals. There is the further point that with long tubes of small diameter, sufficient bow-shaped bending will take place between the tube plates to compensate for any differences of expansion between the tubes and the shell.

When the latent heat in the water which is evaporated by the primary steam in one set of tubes is used to evaporate water in another set, then we get what is known as double effect, and if this is repeated a second and third time we get what is known as quadruple effect. The advantage of a multiple effect is that much more water can be evaporated per pound of steam used than if a single effect only is adopted. For instance, with quadruple effect about 3.4 lb. of distilled water can be produced for each 1 lb. of exhaust steam from the turbine-driven feed pumps; on triple effect 2.6 to 2.8 lb. is produced, the latter under favourable conditions. At Comines the plant was originally designed to work triple effect with one spare effect, while on emergency it could also be worked with one or two effects; however, owing to the fact that the plant required so much less cleaning than was anticipated, the spare effect has been used as a preliminary one and quadruple effect has been worked. To explain the operation fig. 1 shows the lay-out of a distiller arranged for double effect, each effect made up with evaporator, separator and heater; the distiller shown is one supplied by the Kestner Company to a power station at Cawn-

* Electrical Review, Jan. 8th, 1926, p. 59 *et sqq.*

pore. The feed water comes into the separator under control from a valve regulated by a float; it flows over a serrated tray, as shown. When the water in the separator falls the valve opens. The water flows down into the evaporator termed the "Calandria," and is heated inside the tubes by the low-pressure or live steam which flows into the surrounding chamber.

In evaporating, the vapour rising carries with it a film of water upwards; this flows into the separator, and after being freed from entrained water it flows into the jacket of the second calandria, part flowing through a branch to a small heater. The precipitation of solids in the feed water is assisted by the water meeting the upward current of vapour from the calandria, and further precipitation takes place in the body of the separator itself; the solids tend to settle down and are removed from time to time with the aid of the sludge boxes below. Thus the bulk of the deposit takes place in the first effect.

The steam, in this case bled from a steam turbine, which heats up the first calandria, is condensed, and flows as water into the jacket of the second calandria through a valve. Owing to the lower pressure in this, a good deal flashes off temporarily into vapour; when condensed it passes through the jacket of No. 1 heater, having been joined by the water condensed in the second calandria, and thence to the feed tank.

Fig. 3 is a diagram of a double effect distiller, showing what sort of results can be obtained; the vapour from the second separator passes through a heater and then flows into the main condenser, the resulting water being returned to the hot well with the turbine condensed steam that was not by-passed. As can be seen, 2,885 lb. of steam at 157 deg. F., 4.4 lb. per sq. in. absolute, passes into the apparatus through the jacket of the first effect calandria; and 5,640 lb. of raw water at 60 deg. F. is pumped through the feed heaters into the two

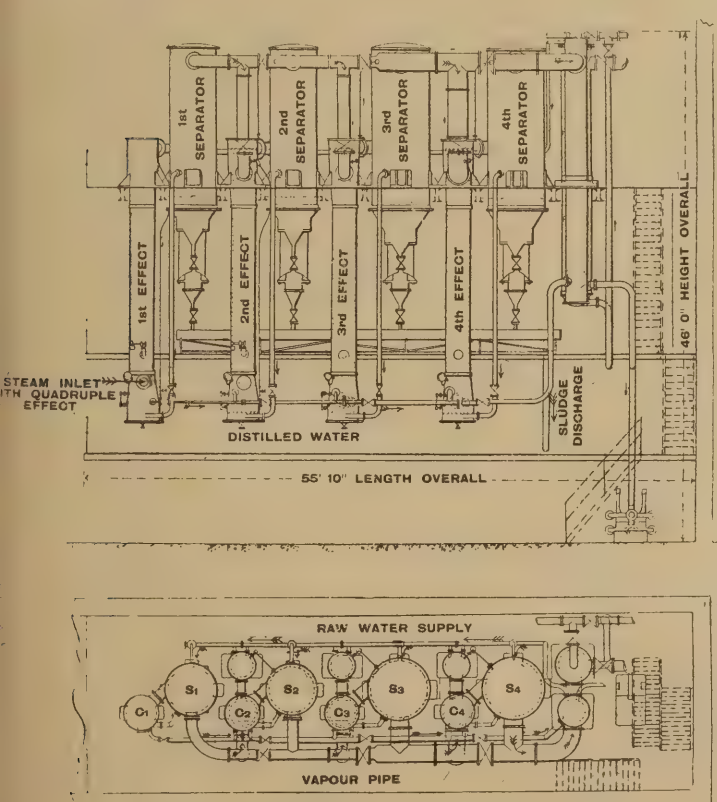

Fig. 2.—Distilling Plant at Comines, France.

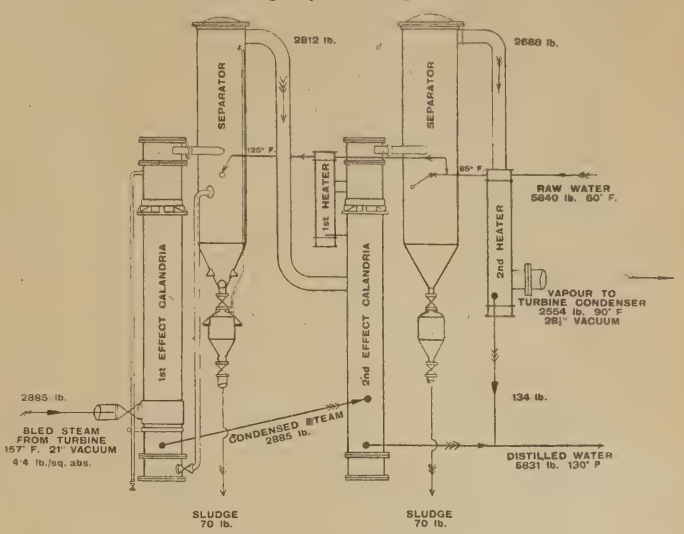
separators, part into each. Part of the steam (5,831 lb.) is condensed and passes out as distilled water at 130 deg. F.; the remainder (2,554 lb.) passes as vapour into the condenser. The impurities in the incoming raw water are drawn off through the sludge boxes.

Fig. 2 shows a diagram of the plant at Comines. The raw water drawn from the River Lys is pumped into the fourth heater, and its temperature is there raised to approximately that of the boiling point of the fourth effect, and by means of float valve control a quantity of water corresponding to the evaporation in this effect is fed into the separator. Part of the remainder, under similar control, passes to the third heater, where a temperature higher than that in the second prevails, and then the process is repeated.

The three heaters are heated by means of vapour from the three separators. The water entering the separators is heated up by the vapour from the calan-



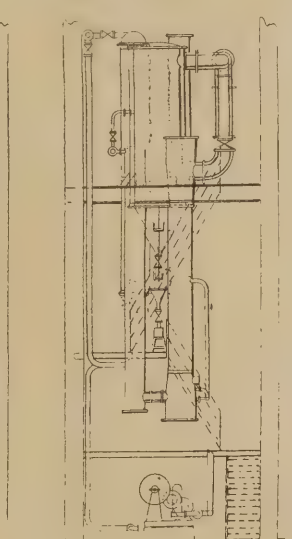


Fig. 3.—Diagram Showing Results Obtained.

drias and flows down into the latter and circulates until it is evaporated by means of the climbing film action.

The vapour which is not condensed from the final effect is passed into a condenser which is cooled by the main feed water; the heat therefore is not lost. There is a further small condenser which cools any incondensable gas before it passes to the vacuum pump. The operating steam is at about 29 lb. pressure absolute.

Naturally, when a multiple effect is used and the initial pressure is only about 15 lb. above atmosphere, there must be a fall of temperature and pressure with each effect, and the smaller the difference in temperature between the vapour on the one side and the water to be heated on the other, the larger the surface of the tubes must be to deal with a given quantity of water to be evaporated. It is claimed, however, that with the Kestner climbing film evaporator the film is so thin and the velocity is so high that the surface required, even with multiple effect, is lower than that which would otherwise be necessary.

To operate the plant there are three pumps on one shaft driven by a motor: an air pump to ensure the vacuum which enables evaporation in the lower effects to take place at a pressure below that of the atmosphere; a distilled-water extraction pump; and a feed pump which pumps the raw water into the different evaporators. At starting, these pumps combined take about 40 h.p., but in normal working 27 to 30 h.p. only is required. The sludge which accumulates in the bottom of each separator is emptied from time to time by means of valves into sludge boxes, as may be seen from the diagram, and when the top valve is closed again the sludge can be discharged into a trough running below the four separators. As can be seen from the cycle of operations, apart from radiation losses, there is practically no heat loss at all. At times when there is insufficient steam from the feed pump turbine exhausts, live steam can be used, either alone or to assist the existing flow.

Sight holes are arranged in separators and sludge boxes so that the operation can be watched. In normal operation one unskilled man controls the apparatus.

Thanks must be given to the Kestner Evaporator and Engineering Co., London, for assistance in the preparation of this article.

Electricity Supply in Great Britain.—XIII.

Northumberland and Durham.

Statutory powers for general supplies of electricity have been granted in respect of the hatched areas on the accompanying map, with the exception of Darlington Rural District and Seaham Harbour Urban Dis-

Electricity Supply in the Counties of Northumberland and Durham.

trict, for which areas applications have only recently been lodged by Darlington Corporation and Seaham Harbour Urban District Council respectively.

The areas* of the Newcastle-upon-Tyne Electric Supply Company and its Associated Companies have not been shown hatched, except where statutory powers for general supplies are held or have been applied for, as mentioned above. This group of companies holds various statutory powers under its Acts for the supply of energy, and also for interconnection, &c., with private companies, one of the most important of these being the Tees Power Station Co., Ltd. The generating station (North Tees) of this non-statutory undertaking is situated at Billingham, and is indicated on the map by a square dot.

Although the development of the electricity supply industry in the North-East Coast Area (Area No. 16) has been tremendous, it would seem from the following figures (extracted from the annual publication of the Electricity Commissioners†) that railway electrification in the London Area (Area No. 7) has enabled the latter to maintain the rate of increase in the number of units generated per annum, whilst the former has slackened pace.

Year ending March 31st.	kWh generated. Area No. 16.	Area No. 7.
1922 ...	692,658,577	1,382,462,122
1923 ...	849,694,538	1,561,814,992
1924 ...	985,911,020	1,768,070,741
1925 ...	1,041,659,090	1,949,825,578

The 1921 Census gives the following particulars for the Administrative Counties of Northumberland and Durham and their associated County Boroughs:—

	Acres.	Persons.	Resident families.	Buildings not containing dwellings.
Northumberland	1,291,515	746,096	160,252	12,563
Durham... ...	649,244	1,479,033	313,791	16,109
Total	1,940,759	2,225,129	474,043	28,672

The map§ is reproduced by permission of the Controller of H.M. Stationery Office. The original was prepared by the Ordnance Survey Department for the 1917 Boundary Commission. The following alterations of areas, &c., have been made since 1917:—

(1) The Parishes of Bebside, Cowpen, Horton and Newsham and South Blyth have been united to form the new Parish of Blyth.

(2) The boundary line between the Seaton Delaval Urban District and Parish and the Whitley and Monkseaton Urban District and Parish has been altered.

(3) Parts of the Parishes of Healeyfield and Knitsley have been added to the Urban District and Parish of Consett, and part of the Parish of Knitsley has been transferred to the Parish of Healeyfield.

(4) Part of the Parish of North Seaton has been added to the Urban District and Parish of Newbiggin-by-the-Sea.

(5) The Parish of Seaton Carew has been merged into the Parish of West Hartlepool, which is now co-extensive with the County Borough.

(6) Part of the Parish of Hawthorn has been added to the Parish of Haswell.

(7) Part of the Parish of Pelton has been added to the Urban District and Parish of Chester-le-Street.

(8) The County Borough and Parish of South Shields have been extended so as to include parts of the Parishes of Harton, Whitburn and Boldon. The remainder of the Parish of Harton was added to the Parish of Whitburn.

(9) The Urban District of Washington has been created, comprised of the Parishes of Barmston, Usworth and Washington.

(10) Blyth Urban District has been created a Municipal Borough.

(11) Billingham Parish has been created an Urban District.

The Economical Loading of Power Plant.

The Use of the Willans Line.

By J. S. PILLANS, A.M.I.Mech.E.

Shift and other engineers who are in charge of steam-driven generating machinery, of which two or more sets are run in parallel, are frequently of the opinion that a saving of steam will invariably follow the giving of as large a proportion of the load as possible to the set which originally showed the lowest steam consumption per kW on test.

This belief, more especially when carried into practice, is undoubtedly praiseworthy, as in the majority of cases it will have the desired effect. At the same time, however, it is interesting to note that for reasons which will be entered into more fully, it does not necessarily follow that the bearing of the major part of the load by the most efficient of the paralleled sets will result in any saving whatever.

The point may be summarised as follows:—Assuming two identical turbo-driven sets, paralleled to the main bars and sharing the load; assuming also that steam and other operating conditions are alike in all respects, and further that their original consumption characteristics were similar; but that their sole difference consists of a pass-out gear fitted to Set 1, by means of which a constant quantity* of steam is drawn for process work, the Willans lines for the two sets will then lie parallel if plotted to a common base, as in fig. 1 (p. 452), though separated by a distance corresponding to the amount of pass-out steam.

It will be seen that in this and similar cases where the Willans lines lies parallel, the combined steam consumption per kW for the two sets is independent of the load distribution.

By way of example, the full load F C (fig. 1) may be taken as carried by Set No. 1, Set No. 2 running light. Then the combined steam consumption in lb. per hour will be given by AC plus EF.

*Conditions which, on the ordinary run of pass-out turbines will not be attainable. The assumption is, however, justifiable in order to illustrate the contention.

If now the load is wholly transferred to Set 2, with Set 1 running light, we have the combined steam consumption equal to BC plus DF, and hence for all variations of the load distribution AC plus EF equals BC plus DF. This shows that for paralleled power plant, the Willans lines of which under actual operating conditions are separated by a constant difference, the load distribution is immaterial.

In the case of, say, two paralleled engine-driven sets, of which one is less efficient than the other by reason of badly-fitting piston rings, at no load, the difference in steam consumption will be relatively small, increasing rapidly with rising mean effective pressure, a state of affairs shown by the Willans lines in fig. 2; as before, it may be assumed that the leakage mentioned constitutes the sole difference between the sets, although the issue is dependent only on the Willans lines and not upon the determining factors of these, such as capacity of plant, &c.

Applying the same reasoning as in the former example, it will be seen that economy of operation will vary with the proportion of load carried by Set 2, and that this condition will be shown by divergence or convergence of the Willans lines.

Naturally, under the normal conditions of station operation, the sets will be subject to widely different conditions, such as initial efficiency of design, state of repair, normal vacuum, distance from boilers, generating efficiency, &c., all of which, however, may conveniently be combined and correlated by drawing the Willans lines to a common base; whether the sets be large, small, turbo or engine driven, old or new, &c. Such a case may be depicted in fig. 3 for a medium-sized station equipped with turbines, but having reciprocating stand-bys. If a chart of this kind is drawn up by individual stations, it constitutes a valuable guide for the shift engineer who, by visually comparing the lines of the sets he is running, is enabled to form an accurate judgment of the advantage to be gained by loading up to the maximum desirable the set or sets which show a Willans line having the smallest angle of inclination to the horizontal. As heretofore, the question which set or sets he shall run will depend on local conditions; the chart makes no attempt to govern this, but only to enable the running sets to be used to the best advantage.

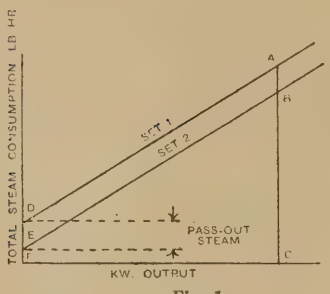

Fig. 1.

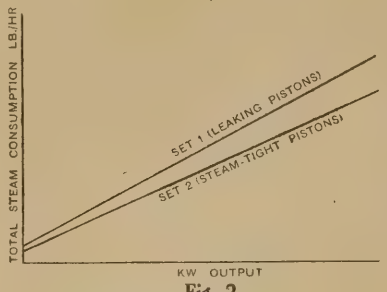

Fig. 2.

The Use of the Willans Line in Parallel Operation.

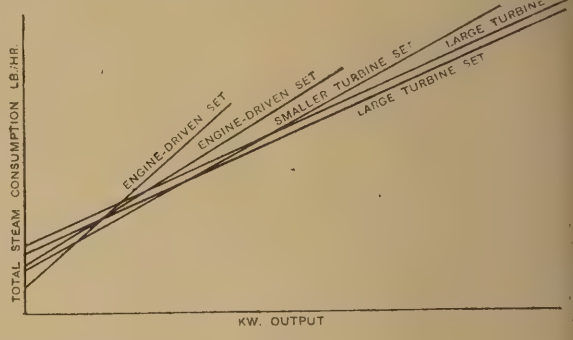

Fig. 3.

In certain cases such as will occur when impulse turbines are fitted with governors of the overload nozzle disclosing type, the Willans lines will not run straight. Under these conditions, obviously, it will be necessary to judge the slope of the line between the required limits of the load.

It is suggested that a chart of this description showing the Willans lines of all sets in the station, under normal conditions of working, could with advantage be displayed in every control room and switchboard gallery, and should prove of material value in the economical working of the station.

The Birmingham Electric Club.

Annual Dinner.

The fifteenth annual dinner of the Birmingham Electric Club was held at the Grand Hotel, Birmingham, on March 12th, and many representatives of the various electrical organisations in the Midlands were present. The company numbered about 250, and Mr. A. E. Cunningworth (President) occupied the chair.

The dinner coincided with the publication of the Government Electricity Bill, and severe criticism of it was voiced by Mr. P. J. Hannon, M.P., in proposing the toast of the "Electrical Industries and Electricity Supply." A serious side of the Bill, he said, and one to which all who were familiar with the direction of electricity schemes would have to give considerable thought, was the fact that out of the 40 clauses of the Bill, there were no fewer than 39 instances in which the work of the National Central Board—composed of the very best minds of the country—became subject to the approval of the Electricity Commission. This, in his opinion, almost amounted to a tragic blunder on the part of the Government, although the present Electricity Commission was efficient, impartial, and competent to deal with the great cause placed in its trust. It would seem to him that the Electricity Commission should prepare the schemes and leave it to the National Board to adopt them, limit them, or cut them down. Real success in the distribution of electricity for the benefit of the nation, the advancement of industry, and the welfare of the people, could never be obtained with the interference of bureaucratic authority.

With regard to the suggested expenditure of 33¼ million pounds on the schemes, the test of the efficacy of the measure was—how much it would cheapen the supply of electricity for power and light to the consumer, and to what extent it would enable districts hitherto deprived of power, through geographical or other reasons, to enjoy sources of electrical power. He had been unable to discover in the Bill any suggestion that Birmingham or similar centres were going to obtain cheaper and more abundant supplies of electricity.

Mr. R. A. Chattock, M.I.E.E. (President of the I.E.E.), responding, said that it was well known that the electrical industry in this country was in a flourishing condition, and he thought they should all be thankful for it. They all hoped that the black cloud that was at present overshadowing the engineering industry of the country would break and that they would soon see a settlement of the trouble which had been threatened. With regard to the Electricity Bill, he quite agreed with Mr. Hannon in his indictment of it so far as the question of control was concerned. He did not think any body of men should be called upon to take the responsibility of determining those enormous issues on which the progress of this country so largely depended, and they all hoped that further consideration and discussion of the clauses of the Bill would direct the Government along the proper lines and that they would eventually get something that would benefit the country and the industry. From conversations that he had had with representatives of electricity supply undertakings he felt that they were looking for something much better than had been described to them. Regarding the statement that a sum of 33¼ millions was to be placed at the disposal of the Board, Mr. Chattock thought that it was quite impossible to say off-hand what finance would be required. Apparently certain stations were to be selected to carry on the supply. Others would undoubtedly have to be established, and it was not clear how these were to be financed and how they were to be worked into the scheme generally. There was very little wrong with many of the existing undertakings as regarded their generating capabilities. They could not want anything better than the station at Manchester. He could not but believe that a

certain eminent electrical engineer had been misreported when he stated the other day that the new Government scheme would have the effect of making it possible to supply electricity for lighting, power, heating and railways at a cost of a farthing per kWh. It was a great pity to lead the people to expect a result of that kind, because he thought it was obvious that the cost, especially for lighting, must exceed that figure very greatly. He thought that what was referred to was the cost of generation. He was glad that it was proposed that a representative of the railways should sit on the Board; he felt that railway electrification was going to be a material factor in the progress of electricity in this country. With regard to the matter of frequency, that had been one of their nightmares in Birmingham. If it was decided to couple up a big district like Birmingham with another district it was possible to do so by means of frequency-changers. New plant should be designed to take into consideration the low-temperature carbonisation of coal. There had been a lot of discussion on the subject of late and methods were being developed which, he thought, would solve the problem. So far they had not had anything which had been commercially possible, but experiments were going on in America on a large scale which they were watching very closely and which bade fair to show good results. He hoped that any scheme developed by that Board would take that into consideration.

The toast of "The King" was proposed by Mr. F. W. Martin, the secretary of the club; the "City of Birmingham," by Prof. W. Cramp, D.Sc., M.I.E.E. (Birmingham), and responded to by Councillor H. K. Beale (Chairman, Birmingham Electricity Supply Committee); the "Birmingham Electric Club" by Mr. H. Berry, and replied to by the President (Mr. A. E. Cunningworth); and "The Visitors," by Mr. F. R. Unwin, A.M.I.E.E., and responded to by Mr. A. D. Phillips, M.I.E.E. (Derbyshire and Notts. Elec. Power Co.).

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

"Electrical Freedom."

Reiterated fallacies are treated seriously at times, and Mr. Robinson's article has not been challenged generally, although when stripped of all personal references, among other myths the spectre of Nationalisation is apparent, for he appears to demand complete control of every industry employing electricity, and suggests that the centralisation of control incurs no additional cost, and gives complete efficiency with economy.

Many newspapers have taken this view, and the following is a fair sample of what is written:—

"Mr. Baldwin's electricity scheme has had a very good Press, all sections have welcomed it. It is hoped that in many districts current will be obtained at less than ½d. per unit."

In addition to the cost of generating current at the station, however, there are other services, and total costs should surely be counted! But is the cost of connecting cables, the new department created, the cost of meter reading, and collection of accounts, &c., included in this figure?

Relieved of financial stringency and given sufficient scope, the manufacturer using steam in process work does not convert from steam to electric drive very readily; on the contrary and under certain circumstances, he cannot afford to buy energy from an outside source.

Mr. Robinson writes: "Surely if the supply of electricity is cheap and abundant, the installations must be cheap and abundant also." What do we find cheap in large installations?

1. A costly cable.
2. A specially built transformer house.
3. Transformer.
4. Main switchboard.
5. Motors, &c.
6. New shafting and drives.
7. New laws and regulations.

These are a few of the difficulties some contractors have to compete with, at least up in this part of the Kingdom, where I am happy to say the supply engineer generally heartily co-operates with the contractor, who is acknowledged to be the unpaid traveller, and commands respect accordingly.

Private enterprise is not finished with, and the contractors may yet be busy fitting up self-contained plants for customers who are experienced in buying "cheap" electricity from outside sources.

A more enlightened policy might, with advantage, take the place of the suggested misdirected one.

L. E. Wilson.

Manchester, *March 8th*, 1926.

If you are not overburdened with correspondence on this subject, may I mention my recent experience with a supply undertaking which obtained an important wiring contract in competition with a reliable independent member of the N.R.E.I.C. The company's tender was slightly higher, but was accepted by the clients, against advice, on the ground that they were good customers of their own. During procedure it came to light that the company were neither complying with the specification on which they tendered nor even complying with their own regulations. Naturally the whole of the wiring had to be pulled out, and this in the case of a company supplying a large area of importance and certainly one with fully competent engineers at the head, who, however, probably think that installation work is as well left to any of the staff who have proved themselves incompetent on the switchboard.

May one reiterate that Mr. Robinson shows so much bias in his statements that most thinking men would be suspicious of his deep reasoning and unlikely to accept his didactic statements without careful examination of the facts from all points of view.

Not a Contractor.

London, *March 12th*, 1926.

In this week's issue Mr. Robinson has received some well-earned rebuffs, and it is to be noted that this humorous (?) engineer now states that this is not a question of municipal trading. The latter statement would point to the fact that the article by Mr. Robinson is inconsistent, as the whole article was crammed with boost for municipal trading. I desire to associate myself with the concluding remark of "Registered Contractor" where india-rubber is mentioned.

Why should supply authorities be allowed to poach in the electrical contracting field when their time should be fully occupied on the supply side of the industry? This growing menace to the electrical contracting industry is but a form of Municipal Socialism, and one might as well say that municipalities should set up business in all trades and thus effectively stop all private enterprise. Who has a better opportunity of making a high-class show of electrical appliances than municipal authorities with the ratepayers' purse? They can generally pick out the best site in a city for a highly extravagant showroom and are in the happy position of being able to use up the kilowatts for demonstration purposes without having to worry about a heavy current bill. Is it to be wondered at, then, that they can sell a few more vacuum cleaners and hair driers than the (according to some people) inefficient contractors? Your correspondents in the current issue have a good grasp of the situation, and it is hoped that something effective will be done in this session of Parliament to put a stop to this municipal poaching. It certainly seems to be the desire of certain individuals to get us "washed out" but—we are waterproof.

Contractor.

Glasgow, *March 13th*, 1926.

The Metering of Electricity.

In your issue of the 12th instant you published an article by Mr. S. H. Penning on the above subject.

In this he explains that a few months ago he devised means whereby both the fixed charge and the low running charge per unit, in a two-part tariff, can be measured by the same meter, and he goes on to describe the means whereby this result is attained.

We think we ought to point out that we have been engaged on this problem for a good many years, and as long ago as March 8th, 1922, we took out our first patent, No. 198,772. The system has also been patented in the United States, Germany, and other countries.

Claim 1 of the patent in question reads as follows:—

"A Motor Electricity Meter in which the rotary element rotates on no load provided with a direct connection between the rotary element and the counting train so that the meter registers continuously at a certain pre-determined rate when no load is being taken in the consumer's circuit."

The Electrical Apparatus Co., Ltd.

R. Amberton, *Director.*

London, *March 12th*, 1926.

Country House Fires.

Your recent article on the above subject has particularly interested me, for only a few weeks ago I was asked to test a private installation with a view to its being turned over to a public supply. The installation, I was informed, was put in only a few years ago and was supposed to have been carried out on the lead-covered system.

On testing, several circuits were found very low, and on proceeding to investigate the cause, I found in one of the bedrooms, near the switch, a single core lead-covered cable, together with a twin flexible, tucked away at the side of the door frame; these passed into the picture moulding and were run along two sides of the room, eventually terminating in a bracket over the bed. On making further investigation, lead-covered cables were observed on the surface of one of the corridor walls, and to all appearances looked as if they passed through the wall into a cloak room, but on making an examination in this room no such wires appeared. In order to locate the direction of these wires, some of the plaster was cut away, and much to one's astonishment, the wires were found bunched and tucked away in a previously made hole which had been filled in with plaster of Paris. Still further investigation revealed some of the wires run along the surface under the picture mouldings and protected by wood casing. At one point where they radiated from a distribution board on the first floor landing, a 12-in. by 12-in. wood pattress was fixed, on which was mounted the distribution board. On removing the screws holding the pattress, a hole was found chiselled out in the plas-

ter and brickwork and the *joint*, as sent herewith, found. In another part of the house a nail driven through the capping and lead-covered cable was located.

As already stated, there were 60 points in the house; not one single junction box was found, all joints having been made in the manner of the sample sent you, and in each case buried.

Needless to say, an adverse report had to be given and the house is now being entirely re-wired.

I thoroughly endorse the remarks regarding the inspection and testing of installations—new and old—by the Insurance Companies, and add that they should be Engineering Insurance Companies which employ a competent electrical staff.

A. Douglas.

Stoke-on-Trent, *March 10th*, 1926.

[The tangle of flexibles, lead-covered wires, bonding wires, and tape which we have received from Mr. Douglas, beats anything that we have previously seen in the shape of a "joint"; we could not have believed that any sane person could have perpetrated such a job. It has one redeeming feature: it shows the inherent safety of electric lighting, for it has been in use for some years, presumably at 50 or 60 volts, without burning out. This must be an exceptionally bad case, but it emphasises the necessity of examining old installations.—Eds. Elec. Rev.]

I have followed with interest the correspondence by Mr. F. J. Moffett in connection with the above subject, and think his suggestion of inspection by the Fire Offices worthy of the fullest consideration.

A considerable number of the leading Insurance Companies have engineering departments which undertake the insurance of motors, generators, transformers, &c., against breakdown, which service includes a quarterly inspection and test.

I see no reason why this service should not be extended to electrical installations generally, the wiring being insured against "Faults," and the service to include a quarterly inspection and test of the whole of the installation. In the case of new work the service would provide for a number of inspections during the course of erection. If this scheme were put into force the person insured would be safe in the knowledge that his electrical work had been carried out in a thorough and workmanlike manner and in accordance with the I.E.E. wiring rules, and it would at the same time reduce the fire risk from the "fusing of electric wires" to a minimum.

C. A. Besley.

Cardiff, *March 12th*, 1926.

Ready-made Showcards.

If manufacturers and suppliers were to provide artistically designed show-cards (of a size suitable for each article) stating clearly the price, use, consumption in watts or units, catalogue number, &c., of the different pieces of apparatus which they supply (for instance: Electric iron, weight —— lb., consumption —— watts, price £——, Cat. No. ——, &c.) we consider that it would materially assist in increasing business.

We suggest that these should be supplied, or sold at a nominal price, to contractors, who would display them with the apparatus in their windows, &c. The cost of making and printing these cards would be low, if a number were produced, but the expense and trouble to a contractor of getting out individual cards is considerable.

J. & T. Robinson.

Croydon, *March 9th*, 1926.

A Bootle Wiring Contract.

Our attention has been drawn to a paragraph in the issue of your journal of the 13th instant, referring to a contract for the electrical installation at the Cleaver Sanatorium, Heswall. The paragraph states that by a majority of the West Derby Board of Guardians (28 votes to 22), it was resolved to apply to the Ministry of Health for a judicial inquiry to be made into the contract.

As the contractors concerned, you will readily understand that our mouths are sealed, and that it would be highly improper for us to refer to the matter in any way until after the proposed inquiry has been held.

Under these circumstances you will, we are sure, be disposed to suspend any judgment on the matter for the present.

The Knowsley Electrical Co., Ltd.
D. McKinnell, *Secretary.*

Liverpool, *March 15th*, 1925.

Electricity Generation in Switzerland.—Our correspondent in Switzerland states that the net production of energy in Swiss power stations at the end of 1925 was 520,000 h.p., a figure which is expected to be increased to 1,850,000 h.p. when all the hydro-electric power houses are fully equipped. Forty-six per cent. of the energy is produced by private enterprise, 17 per cent. by cantonal stations, and 11 per cent. by the C.F.F. stations. The large generating stations at Rempen, Siebnen, Klosters, Chancy-Pougny, Massagno, Näfels, and Turtmann were in full working order during the past year.

Reviews.

Electrical Estimating for Industrial Lighting Installations. By J. C. Connan, B.Sc., A.M.I.E.E. Pp. 214; 33 tables and five appendices. London: E. & F. N. Spon, Ltd. Price 12s. 6d. net.

Mr. Connan has written a book upon a subject which has been neglected in the past, but one which is of vital importance to the prosperity of electrical contracting businesses. From time to time it has been pointed out in the Electrical Review that quotations for lighting installations and similar contracts have shown such great variations in any one case as to lead to the almost inevitable conclusion that most of these quotations were based upon anything but sound estimates. The plague of price cutting which causes so much embarrassment to well organised firms and bankruptcy to their "rule-of-thumb" and slipshod competitors, can only be eradicated if the trade is willing to be educated into better ways, both of organisation in general and of costing and estimating in particular. It is therefore with considerable interest and hope that Mr. Connan's book will be received.

The title of the book is scarcely comprehensive of its contents, for not only does the author indicate very fully what are presumed to be his own methods of estimating, but he discusses at length the theory and practice of illumination and electrical wiring for lighting installations. Thus we find that out of 200 pages of text, 114 are devoted to the following subjects:—Definitions and laws, the theory of illumination, the factors to be considered in choosing the nature and the quantities of the illuminant, systems of wiring and accessories, and the size of conductors. Nothing but praise can be given for the lucid and able description of these subjects, and for the admirable blending of theory and practice contained in the first part of the book, except perhaps that the author sets out in too confident a manner to enlist the support and interest of a certain section of the industry. In the preface it is stated that one of the objects of the book is to enable the contractor who is deficient on the theoretical side to obtain this knowledge without undue waste of time. Another object is to draw the attention of architects, engineers, and others responsible for, or interested in, installations to the subjects treated in order to eradicate the too frequent absence of specifications, or the issue of faulty or incomplete specifications. Both these are laudable objects, and it is to be hoped they will, in the interest of all concerned, be achieved. However, in considering the object first stated in conjunction with the first page of the text, one can imagine the "practical" contractor being a little overwhelmed by such statements as these: "The steradian is given by the formula: $\omega = 2\pi(1-\cos\alpha)$ and luminous intensity by $I = d_F/d_\omega$." There is wisdom in beginning a book with definitions, but if they are stated thus, one is fearful of some of those for whom the book is intended not getting beyond the first page. As a handbook, it ought to be found on the desk of every large contractor, but in the case of the smaller contractor we suggest that he should skip most of the earlier part of the book until he has thoroughly digested the latter part.

In the latter part is to be found an immense amount of data compiled for the use of contractors and, if used with caution, there is no doubt that this information would be of the greatest assistance.

Installation and running costs are discussed, and many tables are included, giving the "equivalent" hours required for a large variety of operations. The installation costs are divided into material, labour, freight and packing, overhead and extras; the very necessary item of profit is also dealt with. The running costs are divided into fixed charges, maintenance charges, and the cost of energy, and each division is considered separately. Checking of quantities, and prices, preparation of the estimate and quotation and an example of a completed estimate and tender then follow.

The "self-cost" prices in loose leaf form, advocated by Mr. Connan, are highly commended, and we repeat the author's words concerning them: "*Every* contractor should prepare for himself a loose leaf book containing the 'self-cost' to him of *all* material he commonly uses *and* should keep the book up to date as the prices change."

There are, however, several important matters in which we find ourselves at variance with the author.

The method of treating labour costs presents what would be in the hands of anyone less capable than the author, a somewhat dangerous means of arriving at estimates of labour costs. This section should be read very carefully and thoroughly understood before it is acted upon. The assessment of "equivalent" hours would be the most convenient method of dealing with labour costs if they could, in their original form, be used upon all occasions, but the author himself gives twelve reasons why this cannot be so. One has to have standard conditions only before their use is justified, and if the actual conditions do not coincide with the basic standard, one is asked to rely upon percentage additions to the standard equivalent hours for each contingency. We distrust these percentages, for in them all the original accuracy of the standards is apt to be lost. Rather than attempt to tamper with the sound standards by the use of elusive and hypothetical percentages, we suggest that the actual hours of work that have been carried out, under conditions that do not approximate to the standard conditions, should be used wherever possible as the basis of

estimates. Estimates are bound to contain some judicious guesswork, when they relate to work that has not previously been attempted, but let the greatest possible proportion of estimates be the reflection of actual practice. It is much safer to work things out for the actual conditions under review than to juggle with figures based upon entirely different conditions and make them do.

The list of overhead expenses and the notes relating to them are comprehensive and of great utility, but here again we cannot see eye to eye with the author, so far as his method of distribution is concerned. In every branch of every trade overhead expenses are the most troublesome part of costs, and therefore of estimates, and we cannot find sufficient theoretical argument in favour of the adoption of any one of the methods suggested. We ourselves fancy quite a different means of distribution.

The author commits an arithmetical error when, on page 160, he endeavours to subtract percentages of two different quantities from a third in order to arrive at the percentage saving in yet a fourth. It just cannot be done so easily. Contractors should certainly be able to demonstrate with actual figures the advantages to be gained by the adoption of their recommendations, but we would plead for accuracy in the figures they use, and thus for their adherence to the advertiser's slogan: "Truth in advertising."

We are in full agreement with the author's dictum on page 170, that thorough practical experience and technical training are necessary qualifications of the estimator. In the same chapter good use is made of a sound system of checking, which will repay careful study.

The section dealing with the completed estimate and the tender might be apt to frighten one who has never taken great care over his estimates. This is, however, the culminating point in the book, and it is sincerely to be hoped that many contractors will actually be frightened by it, but nevertheless take it seriously to heart and endeavour to place their industry upon a higher plane, by making their estimates representative of really sound practice, so that tenders may in future not be discredited owing to their wide disparities.

We must congratulate Mr. Connan upon the production of a book dealing so fully with this very important subject, and, though we cannot agree with some of his basic methods, we think that every contractor who reads the book will find much that will aid him in attempting to estimate and quote more reliable prices.

The Mathematical Theory of Electricity and Magnetism. By J. H. Jeans, D.Sc., LL.D., F.R.S. Fifth Edition. Pp. viii + 652; figs. 140. London: Cambridge University Press. Price, 21s. net.

The work is so well known, and its reputation so widely, indeed universally, acknowledged, that it will not be necessary in this review of its fifth edition to do more than point out to our readers the particulars in which it differs from preceding editions, and describe the new features which have been added so that they may be in a position to judge in what respects the new book is different from that with which they are already familiar. The last edition, though reprinted in 1923, remained unaltered from the form in which it first appeared in 1920, and the changes and additions the author now deems expedient arise in the main from the great advances which have been made in the elaboration and application of the theory of Quanta and the Relativity theory, during the last six years. Thus, in the introductory division of the subject into three branches: Electrostatics, Magnetostatics, and Electrodynamics, it was stated in the fourth edition that Maxwell's hypothesis (*viz.*, that electrostatic and magnetostatic phenomena might be stresses and motion of a medium, consistently with the laws of dynamics) would be dealt with in the body of the book, "an alternative possibility being considered in the last chapter." In this edition the statement becomes: "As will be seen later, recent developments call for at least a drastic modification, and more probably for the complete abandonment of the whole hypothesis." In the first chapter, on "Physical Principles," the section on the "Modern View of Electricity" has been considerably amplified and amended, to bring it in touch with recent developments of theory, but the "summary" has not been altered. There is no further change of importance until Chapter VIII, in which some alterations in the treatment of Ellipsoidal Harmonics are introduced; slight alterations in section 601 and section 620 of Chapter XVIII, again refer to the growth of evidence that a "new system of dynamics and a new electron theory are needed."

Sections 635 and 636, Chapter XIX, on the Zeeman Effect, have been re-written; and section 647 of the same chapter, on the field set up by moving electrons, has been much enlarged. The following three sections dealing with the motion of electrons, and with the radiation of energy, have also been amended; and to section 651 is appended a paragraph, pointing out that the development of the new dynamics makes it clear that the theories of Maxwell and Stokes do not suffice to explain X-radiation.

The really important changes in the new edition consist of additions, at the end of the book, designed to supply in some degree the theoretic developments, the need for which has been indicated from point to point in the body of the work. The fourth edition ended with section 701 of Chapter XX. To this chapter are now added five more sections, treating of Generalised Relativity, Weyl's Electromagnetic Theory and matters cognate: and the new edition contains also an additional chapter, Chapter XXI, dealing with the Electrical Structure of Matter.

It is in this chapter that readers will naturally be most interested, but it is not here possible to reproduce in a few bright, well-chosen words, the substance of what Dr. Jeans, in his concise and lucid style of writing, takes a whole chapter to accomplish. It might be as well, however, to remind the reader as the author does from time to time, of the immensities of magnitude and minuteness which are represented by those little figures so easily written at the right-hand top corner of another symbol. Theoretic investigations do not lead to practical results unless they are thoroughly understood, and it needs a very special effort to really understand dimensions of a magnitude our senses are not fitted to perceive. Mere manipulators of symbols are apt to forget that. Our notions of force, also, are derived primarily from our experience of gravitational forces, amid which we live and move and have our being. "The electric force of repulsion outweighs the gravitational force of attraction in the ratio of 4.2×10^{42}," as the author finds occasion to state in section 28.

A kilogram of electrons, crammed together in cubical piling, would occupy a space measuring about the thousandth part of an inch across each way, while two grammes of electrons, that is to say, two bodies occupying but one thousandth part of the first bodies, would, if placed a metre apart, "repel one another with a force equal to the weight of 3×10^{23} tons." Compare the weight of the earth. We leave our readers with the problem of conceiving the forces which would be required to hold the electrons thus crammed together. Such are the forces with which electricians have to do.

Coils and Magnet Wire. By C. R. Underhill. Pp. xi+494; figs. 197. London: McGraw-Hill Publishing Co. Price, 20s. net.

In view of the widespread use of coils in so many and various types of electrical apparatus, it is rather surprising that there have not been more books written on the arts of their design and manufacture. Mr. Underhill is well known as a writer on magnets, and he has had considerable experience in coil construction. In the present volume he has some useful things to say on the subject, but, unfortunately, he has taken the opportunity to say a number of other things which are by no means so valuable and are but distantly connected with his main theme. In this way he has swollen his book inordinately. For instance, in discussing "Temperature and its Effects," he devotes a paragraph to the liquefaction and solidification of hydrogen, while his references to absolute temperature are much too extensive for the purpose in view. The usual methods of manufacturing magnet wires are described and very complete tables of the properties of bare copper wire and of the space factors, &c., of different kinds of insulated wire are given. These tables refer almost entirely to American wire gauge, however, and therefore have little interest for most British readers. As an example of the author's prolixity we may quote a passage from the chapter on "The Basic Principles of Coils." "The length of the insulated conductor is equal to the length of the bare conductor. The length of the conductor is equal to any of the following: (1) The product of the average girth and the number of turns. (2) The ratio of the volume of bare conductor to the cross-section of the bare conductor. (3) The ratio of (*a*) the product of the coil volume and the space factor, to (*b*) the cross-section of the bare conductor," and then, in case we have not understood, three numerical examples are given and the whole section occupies about one page. As another example of the same fault we may quote two pages given up to a string of the names of devices in which coils occur. Surely electrical engineers do not require to *buy* a list of this sort! Much of the book is on this level and it is difficult to imagine for what type of reader it has been intended.

The forms of coils used for various purposes and methods of winding them are dealt with fairly fully, but a more detailed description and discussion of automatic winding machines would have been welcome. A considerable section of the book is devoted to Insulation, Varnishes, Treatment and Impregnation. Most of the section is of the nature of a symposium to which numerous authorities on these subjects have contributed directly or indirectly. In such a symposium there is necessarily much repetition and the opinions expressed on some points are not all identical. Here we feel we should like to call upon the author's experience in deciding between them, but he fails us. The volume terminates with a useful chapter on testing.

The author has read widely and has spent immense pains on his book; there is a vein of good material running through its pages and if this had been separated from the rest and published at 7s. 6d. it would have been worth the money.

Engineering Apprentices' Competition.—The London Association of Foremen Engineers, in conjunction with the London County Council, has established a scheme for the award of prizes to approved students of mechanical engineering who submit finished pieces of work for competition in accordance with specified conditions. Prizes of £5 and a gold medal, £2 and a silver medal, and £1 and a bronze medal, and a silver shield to the Institution presenting the winner of the first prize, will be awarded.

D

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The Threatened Engineering Lock-out.—Last week the National Committee of the Amalgamated Engineering Union instructed the 900 employés of Messrs. R. Hoe & Co., Ltd., who struck work without the Union's sanction, to return to work, stating that if they failed to do so "disciplinary action" would be taken against them. It was expected that the men would accede to this instruction and thus avert the lock-out which was due to commence this week-end, which would have enabled the questions at issue between Messrs. Hoe and their employés to be dealt with officially by the Union.

In consequence of the alteration in the position, the London District Committee of the Electrical Trade Union decided to defer further action in the matter of holding up electricity supply in the event of a lock-out until to-day (Friday), when a meeting is to be held.

The strikers refused, however, to obey their Union's instructions, and it was expected at the time of our going to press that they would either be expelled from the Union or alter their attitude at the last moment. In any event it was not anticipated that the employers' lock-out notices would be acted upon.

Irish Free State Electrical Imports.—From trading returns issued recently, dealing with the Free State imports and exports for the whole of 1925, it appears that electrical goods to the value of £403,585 were imported, as compared with £393,987 worth in 1924.

British Capital in Poland.—The British Overseas Bank, which is largely interested in the Anglo-Polish Bank (of Warsaw), the Polish sugar industry and electricity undertakings in Poland, has arranged a credit for £250,000 for the construction of electric railways and tramways for the suburb of Warsaw.—*Reuter* (Warsaw).

Electricity in "Weir" Houses.—At its next meeting, Glasgow Corporation Electricity Committee is to consider the request of the local branch of the Electrical Trades Union that the Corporation should refuse to supply electricity to Weir housing schemes. Meanwhile, Mr. Mitchell, the electrical engineer, is to investigate Messrs. Weir's methods of executing electrical work for these houses.

Metal Trades Benevolence.—This week a special appeal has been issued by the Lord Mayor to 30,000 firms connected with the metal trades in Great Britain, calling upon firms and individuals to assist the funds of the Royal Metal Trades Pension and Benevolent Society, which holds its 78th anniversary festival on June 1st next with the Prince of Wales present. It is desired to increase the income by £10,000 per annum so as to advance pensions above the pre-war basis and to help cases which have at present to be refused. Mr. A. K. Steven (McDowall, Steven & Co., 2, Upper Thames Street, London, E.C.4), is chairman of the board of management.

Reunion of the Ex-British Westinghouse Association.—Over 130 ex-British Westinghouse men attended the eighth annual reunion dinner at the Holborn Restaurant, London, on March 5th. Mr. O. H. Baldwin presided. In proposing the toast "The Association," he said that the attendance was the best since the first reunion in 1919. The toast was coupled with the names of Mr. L. S. Richardson, the hon. secretary, and Mr. W. E. Warrilow, assistant hon. secretary, who both acknowledged. The "Silent Toast," also given from the chair, included references to the members of the Association (Messrs. E. R. Myers, Max. Halder, F. Suffield, E. Chambers), who have joined the great majority during the past year. "Absent Friends," submitted by Mr. C. T. Allan, was honoured at 10 p.m. Mr. M. M. Gillespie did full justice to the toast of "The Chairman," and Mr. Baldwin, in reply, was full of reminiscences, anecdotes and narratives. The entertainment, under the direction of Mr. H. S. Aspinall, included items of song, story and legerdemain. An important event of the evening was the ballot for life membership of the Association. The gathering included a number of ex-B.W. men who had specially travelled from South Wales, the Midlands, Lancashire and Scotland. The Association is, we understand, in a flourishing condition and the ninth reunion will be held in London on March 11th, 1927; Mr. L. R. Morshead, who is a member of the original committee, has kindly agreed to occupy the chair on that occasion.

Australian Radio Exhibition.—The N.S.W. Electrical Employers' Federation is organising an exhibition of radio apparatus to be held in Sydney for a week commencing May 3rd.

New Australian Companies.—The Western Electric Co. (Australia), Ltd., was recently registered in Sydney, with a nominal capital of £100.

Town Lighting Ltd., is the name of a company recently registered in Sydney, with a capital of £10,000, to acquire a concession to supply electricity in the municipality of Bombala (N.S.W.).

British Industries Fair.—Correction.—The Imperial Engineering Co. asks us to state that its wash boiler mentioned in our last issue, in connection with the Birmingham Fair, has a capacity of 10½ gal., not 2½ gal. as stated.

Foreign Samples Exhibitions.—During 1925 the Department of Overseas Trade organised 41 foreign samples exhibitions in London and provinces, mainly with the assistance of local Chambers of Commerce. The number was nine greater than in the preceding year, but the attendance was lower owing to a new policy of restricting invitations to firms known to be directly interested in the goods displayed. A total of 10,247 samples were loaned as well as 16,621 foreign catalogues, among which were publications dealing with electrical goods. The work of the Foreign Catalogue Library continues to increase and the collection now numbers 16,254.

Unemployment.—There was a further reduction (18,660) in the total of registered unemployed persons during the week ended March 1st. The total was also 128,518 less than at March 2nd, 1925.

Hackney Electricity Department: A Protest.—Rather late in the day the Council of the Hackney and Stoke Newington Chamber of Commerce has passed a resolution protesting against the Hackney Electricity Department selling fittings and conducting wiring contracts by direct labour and in competition with traders in the borough. The Council, among other things, expresses the view that the showrooms should be used for the display of goods and not for the sale thereof. The resolution does not say whether those who receive the orders as the result of this display will be prepared to bear their fair share of the cost of the upkeep of the showrooms.

An Engineering Merger.—It is announced that the boards of Mirrlees, Bickerton & Day, Ltd., and the Mirrlees Watson Co., Ltd., have decided to recommend the amalgamation of the two companies between which there exists a close association. The merger will be effected by the sale of the assets of the Mirrlees Watson Co. to the other company for a consideration of 244,000 fully-paid ordinary shares in Mirrlees, Bickerton & Day, Ltd. This and shares already held and £50,000 to be retained will enable the Mirrlees Watson Co. to allot to its shareholders seven new shares for each five held, together with a capital repayment of 5s. per share in the event of liquidation and distribution of assets. Mirrlees, Bickerton & Day, Ltd., will make the necessary increase of capital, and holders of ordinary shares in the company will receive a bonus of 2s. 6d. per share.

Proposed European Cable Syndicate.—It is stated that the idea of re-establishing the former Central European cable syndicate has been brought forward. A disposition to the joint regulation of prices is said to exist between makers in Hungary and Austria, but the cable works in Czecho-Slovakia have already declined to co-operate. An official proposal has so far not been placed before the German works, although it is considered that the syndicate of the latter will not readily surrender the position which it has regained in the world markets. The reconstitution of the international syndicate is said to be rendered difficult not only by the negative attitude assumed by the English cable makers, but also by so-called "dumping" by French firms as a result of the depreciated franc. The situation in the international cable market is characterised by the results of the recent competition thrown open by the Brussels city authorities, when the prices quoted showed a difference of up to 50 per cent., the lowest tender having been submitted by a German works (the Cologne Land and Marine Cable Company)

Disclaimer.—Messrs. Kershaws, Cheetham Hill Road, Manchester, ask us to state that neither they nor their senior partner, Mr. A. Kershaw, are in any way connected with the firm of Kershaw & Wood which was mentioned in our "Bankruptcy Proceedings" last week.

Lead.—Messrs. James Forster & Co., reporting on March 13th, stated: "Closing prices yesterday were £31 11s. 3d. for March and £31 18s. 9d. for June, against £32 7s. 6d. and £32 11s. 3d. respectively at the end of last week. There is no material change in the position this week, except that supplies are not quite so plentiful as recently. However, prompt lead ex ship is easily obtainable, and there is a prospect of considerable arrivals of lead during the next six weeks. Consumption remains on a restricted scale in this country, while in Germany there is little or no improvement. The rate of consumption of lead in America has fallen from its recent high level, this being reflected in the constantly falling price in that country."

The Hiring of Apparatus.—The burgh electrical engineer of Greenock has sent us a copy of a pamphlet which is being issued to consumers—actual and potential—setting out the charges for the hire and hire-purchase of electrical apparatus. The Corporation's scheme covers cookers, fires, kettles, irons, and water-heating appliances and the terms are very reasonable.

Feed-Water Regulators.—During the past two months Messrs. James Gordon & Co., Ltd., have received orders for over 70 equipments of Copes automatic feed-water regulators. Amongst these are included eight for the Oldham Electricity Works and eight for the Synthetic Ammonia & Nitrates Co., besides a number for export.

New Italian Companies.—Among the electrical companies recently formed in Italy are La Società per Intraprese Trazione Elettrica, of Asti, capital 75,000 lire; La Società Italiana per Istrumenti Elettrica Pizzi e Trovero, of Milan; La Società La Centrale per Finanziamente Imprese Elettriche, of Leghorn, capital 1,000,000 lire; La Società Lombarda Applicazioni Elettriche, of Voghera, capital, 200,000 lire; La Società Astese Filovie Elettriche, of Asti, capital, 10,000 lire; La Società Radio-Elettro-Mecannica Bruno Bamoli & Co., Bologna, capital, 300,000 lire; La Società Industrie Elettriche Carolei (Cosenza), capital, 600,000 lire; and La Società Metallurgia-Elettrica, "S.I.M.E.," Milan.

Austrian Power Exhibition.—Arrangements are in progress for the holding of an "Energy Economy Exhibition" in Vienna in 1927. Sections will be provided for electricity, coal, gas, oil, and water power.

Trade Announcements.—MESSRS. WALKER, CROSWELLER AND Co. have removed from Strand, W.C.2, to 54-58, Queen Elizabeth Street, London, S.E.1. Telegraphic address: "Instrukemi, Boroh, London"; Telephone No.: "Hop 5786."

MESSRS. HAMNETT & ANDREW, insulating material manufacturers, have moved to larger premises at Devonshire House, Rusholme Road, Manchester. (Telephone: Ardwick 3802.)

MR. H. A. ANDREWS, formerly assistant engineer with Messrs. W. Coates & Sons, Dublin, and manager of the Electrical Department of Exchange Buildings, Dublin, has now commenced business as an electrical contractor at 17, Kildare Street, Dublin.

BROOKHIRST SWITCHGEAR, LTD., announces that it is transferring, at the end of the present month, its Birmingham office from Corporation Street to Essex House, Temple Street. Here, a fully-equipped showroom will be opened for the purpose of demonstrating the latest developments in its electrical control gear. The company already has showrooms in London and Glasgow. A showroom in Manchester will be opened shortly, and others are in preparation in Leeds, Bristol, &c.

ELECTRO-MECHANICAL SUPPLIES, LTD., Midland agents for the London Electric Wire Co. & Smiths, Ltd., have moved to larger premises at 44, Bayley Lane, Coventry.

THE BRITISH THOMSON-HOUSTON CO., LTD., has acquired new premises at 10 and 11, Snow Hill, Birmingham, to which the Birmingham branch will be transferred on March 22nd. A showroom is being arranged for the display of lighting fittings, radio apparatus, and domestic appliances. The telephone number is "Central 8301" and the telegraphic address "Asteroidal, Birmingham."

MESSRS. FREDK. THOMAS & Co. announce that the Castle Engineering Co., Ltd., is not now acting as their agent for Lancashire. The territory has been taken over by Messrs. P. Adair, Ltd., St. John Street Chambers, Deansgate, Manchester, who are carrying stocks of electric light fittings and alabaster bowls.

CAPT. I. MACKINTOSH, for the past six years technical assistant to Mr. G. Stephen Corlett, consulting engineer, has decided to commence practising on his own account. He is opening an office at Midland Bank Chambers, Wigan, and will be pleased to receive catalogues from manufacturers.

PHILIPS LAMPS, LTD., has opened a branch office at 16, Clarence Street, Belfast, to serve Northern Ireland.

TWISS ELECTRIC TRANSMISSION, LTD., has transferred its registered offices to Culford Works, Kingsbury Road, Dalston, N.1, thus consolidating the whole of the business in the premises acquired last November.

Catalogues and Lists.—MESSRS. L. G. HAWKINS & Co., LTD., 30-35, Drury Lane, W.C.2.—An illustrated folder describing the new "Universal" portable oven cooker.

MESSRS. PETTERS, LTD., Westland Works, Yeovil.—A well-illustrated catalogue of the company's 1926 models of oil engines, including generating sets.

THE HENDON ELECTRIC LAMP CO., LTD., 104, Southampton Road, W.C.1.—Two illustrated and priced leaflets dealing with an electric iron, and voltmeters and ammeters respectively.

MESSRS. GENT & Co., LTD., Faraday Works, Leicester.—Leaflet 85B, illustrating and describing the "Tangent" visible and audible staff locater.

THE CONSOLIDATED PNEUMATIC TOOL CO., LTD., 170, Piccadilly, W.1.—A pamphlet advertising "Duff" governor-controlled self-lowering jacks.

METRO-VICK SUPPLIES, LTD., Trafford Park, Manchester.—Five priced and illustrated booklets dealing respectively with the "Cosmos" home iron; electric lighting fittings; shop-window reflectors; "Cosmos" fires; and automobile and battery lamps.

MESSRS. W. CHRISTIE & GREY, LTD., 4, Lloyd's Avenue, E.C.3.—A pamphlet dealing with the prevention of the transmission of noise and vibration.

THE PERRY PREHEATER CO., Imperial Buildings, 56, Kingsway, W.C.2.—A pamphlet containing full details of the "Perry" system of preheating air by the use of waste gases.

THE ROYAL INSURANCE CO., LTD., 1, North John Street, Liverpool, has issued a 1926 edition of its illustrated motor insurance pamphlet: "Road Risks Illustrated."

THE WEINBAU INCANDESCENT & ELECTRICAL CO., 327-335, Commercial Road, E.1.—A net trade price list of electrical supplies.

MR. J. H. HEATHMAN, Parson's Green, Fulham, S.W.6.—Illustrated leaflets advertising ladders, trucks, fire-fighting accessories, &c.

THE CAMBRIDGE INSTRUMENT CO., LTD., 45, Grosvenor Place, S.W.1.—A folder advertising the company's "easy-to-read" dial thermometers.

FOSTER INSTRUMENT CO., Letchworth, Herts.—Catalogue No. 42, a brochure dealing with pyrometers of various types, including methods of using them. Fully illustrated.

MOULDENSITE, LTD., Darly Dale, Derbyshire.—A catalogue of plastic moulding preparations, impregnating varnishes and enamels, lacquers, cements, &c.

THE KARTRET SWITCHGEAR CO., LTD., 7, Carteret Street, Broadway, S.W.1.—A well-illustrated catalogue containing particulars and prices of the company's switch- and fuse-gear.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—March stock list of motors and dynamos.

MESSRS. J. J. EASTICK & SONS, 118, Bunhill Row, E.C.1.—An illustrated pamphlet describing "Eelex" standardised plugs and sockets for radio connections, terminals of various kinds, coil holders, h.p. batteries, frame aerials, &c. Priced.

THE SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, W.C.2.—A catalogue of electric lighting accessories and pamphlets dealing with a hole cutter and switch- and fuse-gear. Illustrated and priced.

Deeds of Assignment.—R. E. LOWES, electrical and radio engineer, Victoria Chambers, Laura Street, Sunderland.—Particulars of claims to the Trustee, Mr. A. J. Gray, 3, Manor Place, Sunderland.

A. G. SMITH, electrician, 122, Titchfield Street, Kilmarnock.—Particulars of claims to the trustee, Mr. J. A. Carson, 8, Duke Street, Kilmarnock, by March 27th.

Bankruptcy Proceedings.—C. G. HOFMAN (trading as W. J. Chambers & Company), radio component manufacturer and electrical engineer, Cowthorpe Street, Wandsworth.—An application for an order of discharge was made on March 5th, to Mr. Registrar Francke, at the London Bankruptcy Court, on behalf of this bankrupt, who failed last July, with ranking liabilities of £3,497 and assets of £192. The failure was attributed to ill-health and consequent falling away of business and to lack of capital. The discharge was granted subject to a suspension of two years.

J. F. CARR, 89, Aston Avenue, Fallowfield, Manchester, electrical goods agent.—The public examination of this debtor was held on March 12th at the Court House, Manchester. The statement of affairs showed ranking liabilities of £1,995, while the assets, amounting to £32, were insufficient to cover the balance due to secured creditors. The examination was closed.

W. N. SMART, electrician, late of 17, 19 and 19a, Cross Street, Oldham.—Receiving order made March 5th, on debtor's own petition.

YOULL, FRASER & Co., LTD., electric lamp factors, Bertram Chambers, 6, Hunter Street, Liverpool.—Receiving order made March 4th, on creditor's petition.

H. TIDSWELL (H. Tidswell & Co.), electrical engineer, 11, Bazaar Street, Pendleton.—Receiving order made March 6th, on debtor's own petition.

H. R. ALTHORP, electrical engineer and contractor, 13, Wellington Crescent, Shipley, Yorks.—Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford, released February 25th.

H. A. BIRLESON (Birleson & Co.), electrical engineer, Clarence Buildings, Fazackerley Street, Chorley, Lancs.—Trustee, Mr. H. Parker, 11, Winckley Square, Preston, released February 26th.

S. J. WATSON, lately carrying on business with H. Rothwell and F. C. Jinks, as The Vulco Magneto Co., 11, Long Acre, W.C.—Last day for proofs for dividend, March 27th. Trustee, Mr. D. Williams, Official Receiver, Carey Street, W.C.

J. HUMPHREYS, plumber and electrical engineer, the Yard, behind the Plough Inn, Oldham Road, Rochdale.—Last day for proofs for dividend, March 24th. Trustee, Mr. J. G. Grant, Official Receiver, Byrom Street, Manchester.

J. A. A. BARDSLEY, electrical contractor, 91, Old Hall Lane, Withington, Manchester.—Receiving order made March 8th on debtor's own petition.

A. RICHARDSON, electrical engineer, 36, School Road, Sale, Chester.—Receiving order made March 8th, on debtor's own petition.

G. R. SPARROW, electrical engineer, late of 6, Trelawn Road, Brixton, S.W.—Receiving order made March 8th, on debtor's own petition

W. M. HORSFALL, electrical engineer, 7, Redcross Street, Liverpool.—Second dividend of 5½d. in the £, payable March 19th, at the offices of the Official Receiver, 11, Dale Street, Liverpool.

S. A. WARDELL, electrical contractor, 83, Raleigh Road, Richmond, Surrey.—First and final dividend of 3½d. in the £, payable March 29th, at the office of the Official Receiver, 29, Russell Square, W.C.1.

S. H. BARDWELL (Bennett, Bardwell & Co.), electrical engineer, 22, Church Street, Basingstoke.—First and final dividend of 5s. 11½d. in the £, payable March 24th, at the Official Receiver's Office, Midland Bank Chambers, High Street, Southampton.

Company Liquidations.—GAS AND ELECTRIC SECURITIES, LTD., 14 and 16, Cockspur Street, S.W.—Under the compulsory liquidation of this company, accounts have been lodged showing total liabilities of £19,512 (unsecured £18,293), assets valued at £2,521, and a deficiency of £15,824, with regard to contributories, the issued capital being only three ordinary shares of £1 each. Mr. E. T. A. Phillips, Official Receiver and Liquidator, reports that the company, which was promoted by Mr. F. W. Salisbury-Jones, was registered as a private company

on February 2nd, 1923, with a nominal capital of £1,000, and was formed to deal generally in securities and investments of every kind. No business was done until August, 1923. The failure of the company is, in the opinion of the Official Receiver, due, generally, to the fact that it had not in reality any independent existence and particularly to its assumption of liability in connection with another company.

Charles Bell, Ltd., electrical and mechanical engineers, Bradford.—A meeting of creditors was held recently, at the offices of Mr J. Lund, Darley Street, Bradford, the liquidator appointed in the voluntary liquidation of the company. A statement of affairs was submitted which disclosed liabilities of £6,733, all due to unsecured creditors. The net assets amounted to £3,135, leaving a deficiency as regarded the creditors of £3,598. The issued capital amounted to £12,003, so that there was a total deficiency of £15,601. A deficiency account was submitted which showed that there had been a loss of £9,011 on the trading from January 1st, 1922, to February 13th last. The liquidator reported that the business was commenced in 1874 by Mr. Charles Bell. He died in 1890, and his two sons, Lazarus Bell and T. Bell, continued. The latter died in 1916 and the business was then continued until 1921, when the company was formed The trading had resulted as follows: 1917, profit of £3,466; 1918, profit of £1,164; 1919, loss of £776; 1920, profit of £2,594; and 1921, profit of £1,277. The company took over the business in December, 1921, and at that time the business had a capital of £12,000, after taking into consideration £4,000 in respect of goodwill. The account for 1922 disclosed a turnover of £25,000 and a loss of £1,888. For the following year the turnover was £16,467, and there was a loss of £1,119. In 1924 the turnover was £17,471, and the loss £1,718, and for 1925 there was a further loss of £3,526, on a turnover of £17,592. The accounts to February 13th last showed a further loss of £758. It was decided that application should be made to the Court for the appointment of Mr. S. S. Tadman as joint liquidator with Mr. Lund, and a committee of inspection was also nominated. The following are creditors:—

	£		£
Bradford Corporation	116	Dawson, F.	159
Brocklehurst, W. H.	150	Taylor & Son, J.	208

Oco Electrical Appliances, Ltd.—Winding up voluntarily. Liquidator, Mr. C. D. Britten, Prince's Chambers, 16, John Dalton Street, Manchester. A meeting of creditors was called for March 15th; particulars of claims to the Liquidator by April 20th.

"Radioelectric," Ltd.—A meeting of members is called for April 12th, at the offices of Messrs. Reeve, Parker & Co., 2, Coleman Street, E.C., to hear an account of the winding up from the Liquidator, Mr. A. G. Parker.

Pressland Electric Supplies, Ltd.—A petition for the winding up of this company has been presented to the County Court of Surrey by Burndept Wireless, Ltd., of Aldene House, Bedford Street, Strand, W.C., creditors, and will be heard at Kingston-on-Thames on April 30th.

Lyme Regis Electric Light & Power Co., Ltd.—A meeting of members is called for April 13th at Basildon House, Moorgate, E.C.2, to hear an account of the winding up from the Liquidator, Mr. L. W. Hawkins.

Ingleby & Co., Ltd., Leeds.—First and final dividend of 6⅝d. in the £.

County of Dorset Electric Supply Co., Ltd.—A meeting of members is called for April 13th, at Basildon House, Moorgate, E.C.2, to hear an account of the winding up from the Liquidator, Mr. L. W. Hawkins.

Electrolite, Ltd.—Mr. T. Gourlay, Official Receiver and Liquidator, 29, Russell Square, W.C., released March 9th.

Northumberland & Durham Radio Engineering Co., Ltd.—A meeting of members is called for April 9th, at Bank Chambers, 24, Grainger Street West, Newcastle-on-Tyne, to hear an account of the winding up from the Liquidator, Mr. J. Mitchell.

Private Arrangements.—J. E. Kimber and J. Kimber, lately trading as S. Kimber & Sons and The Croydon Electric Co., late of 81 and 81a, Whitehorse Road, Croydon, electrical engineers and jobbing builders.—A meeting of the creditors of the above was held recently at the offices of Messrs. Brown, Peet and Tilley, C.A., Mark Lane, E.C., when the chair was occupied by the representative of the Credenda Conduits Co., Ltd., the largest trade creditors. A statement of affairs was presented as at January 31st, which showed liabilities of £2,155, all due to unsecured creditors. There was a fully secured creditor for £650, and the security held totalled £1,000. The net assets were £1,078, leaving a deficiency of £1,077. Mr. Peet said that the debtors carried on two businesses, one an electrical business and the other that of jobbing builders. The electrical business was commenced about 2½ years ago. According to a profit and loss account, for the year ended December, 1924, there was a net profit on the electrical side of £209 and a loss of £31 in connection with the building business. Mr. Peet said that there were no accounts for 1925, but according to information received the sales for the electrical business only were £4,200 and the gross profit was £819. The net profit, if any, could not be ascertained. Continuing, Mr. Peet said that the debtors disposed of the business at the beginning of the year for £300, being heavily pressed by creditors. During the month of February the business had been carried on by the new owner, but Mr. James Kimber had signed orders for goods and some of the creditors present did not know that the business had been disposed of at the time the orders were given. Mr. Peet had been approached by a gentleman who was prepared to assist the debtors by making an offer of 5s. in the £. After some discussion Mr. C. Latham proposed that an offer of not less than 10s. in the £ should be paid within fourteen days, or that the purchaser should surrender the assets on equitable terms, failing which the estate should be dealt with in bankruptcy. The resolution was carried. It was also resolved that a committee should be appointed, consisting of three of the creditors, with power to recommend the acceptance of any proposals in the foregoing resolution, or any modification thereof. The committee consisted of the representative of Credenda Conduits Co., Ltd., Mr. King, and Mr. C. Latham. The following are creditors:—

	£		£
Eaton & Sons	43	Wardle Engineering Co.	30
Credenda Conduits Co., Ltd. ...	253	Wenham Lighting Co.	32
Seraphan & Wood	53	Lighting, Heating and Glass ...	50
William King	176	Edison Swan Electric Co., Ltd....	40
Vulcan Electric Co.	59	Sanders & Co.	97
Metallic Flexible Tubing Co. ...	103	Harris & Bailey	48
Cable Accessories Co., Ltd. ...	131	Stantons, Ltd.	23

Domestic & General Electrical Co., Ltd., Hampden House, Kingsway, W.C.2., electrical engineers.—A meeting of the creditors was held on March 10th. No statement of affairs was presented, but the secretary of the company said that the liabilities amounted to approximately £458 and the assets totalled £251. The company was incorporated in December, 1924, with a nominal capital of £1,000, of which £150 was put up in cash. The company took over the business from a Mr. Purdie, and paid as consideration £500, for which shares were taken. The creditors passed a resolution requesting the shareholders to meet at the earliest opportunity and pass the necessary resolution for voluntary liquidation and they recommended that Mr. W. Osborne, of Messrs. Corfield and Cripwell, Balfour House, E.C., should be appointed liquidator in the voluntary liquidation of the company. The following are creditors:—

	£		£
General Electric Co., Ltd. ...	92	Robert Hornby, Ltd.	53
St. Helens Cable Co., Ltd. ...	66	"The Power Laundry"	47
Macintosh Cable Co., Ltd. ...	26	Capel & Co., Ltd.	52
Sun Electrical Co., Ltd. ...	29	Purdie, H. A.	26

F. R. Hodges and S. V. Styles, trading as The Yorkshire Electric Supplies Co., Canning Street, Hull.—A meeting of creditors was held recently at Hull, when a statement of affairs was presented, which showed liabilities of £672, all due to unsecured creditors. The assets were estimated to produce £534, leaving an estimated deficiency of £138. It was resolved that the estate should be dealt with under a deed of assignment in favour of Mr. H. E. Pettingell, accountant, Hull, and Mr. P. Hodgkinson, accountant, Bradford, as joint trustees. The following are creditors:—

	£		£
Ace Battery Co.	25	Edison Swan Electric Co., Ltd.	66
General Cable Manufacturing Co., Ltd.	251	J. Dyson	70
J. H. Stewart & Co., Ltd. ...	50	Chloride Electrical Storage Co., Ltd.	37

Dissolution of Partnership.—Crockatt & Co., electrical engineers, 182, West George Street, Glasgow.—Mr. H. A. McQueen and Mr. G. B. Crockatt have dissolved partnership. Mr. McQueen will attend to debts and carry on business on his own account as H. A. McQueen & Co. at 182, West George Street. Mr. Crockatt will shortly commence business as Crockatt & Co. at an address to be intimated.

Our Foreign Trade.—February Figures.—The following were the values of imports and exports of electrical goods and machinery during February, 1926:—

	Feb., 1926.	Inc. or dec.	2 months, 1926.
Imports.	£	£	£
Electrical goods and apparatus	252,042	− 91,586	−172,534
Machinery	945,542	+ 10,750	+ 62,742
(Electrical machinery) ...	52,034	− 19,749	+ 476
Exports.			
Electrical goods and apparatus	987,494	+ 24,409	−242,098
Machinery	4,207,786	+319,159	− 54,364
(Electrical machinery) ...	591,048	+106,520	+ 8,815
Re-exports.			
Electrical goods and apparatus	15,218	− 11,856	− 21,765
Machinery	96,334	− 23,683	+ 2,963
(Electrical machinery) ...	4,719	+ 1,160	+ 41

New French Company.—A new company has recently been formed in Paris (13, Rue de Quatre Septembre) with a capital of 500,000 fr. and the title La Société Electro-Chimique "Phoebus," to manufacture dry batteries and electro-chemical apparatus.

Local Exhibitions.—BRIDLINGTON.—An electrical exhibition was opened by the Mayor on behalf of the Corporation at the Victoria Rooms, Bridlington, on March 8th.

EVESHAM.—The Shropshire, Worcestershire, and Staffordshire Electric Power Co. is holding a demonstration of electric service for the home and business, at the Public Hall, Evesham, from March 22nd to 27th inclusive.

KEIGHLEY.—The Corporation Electricity Department is to hold a public exhibition of electrical appliances at the Municipal Hall, from April 12th. Leading British electrical firms and some American producers will be among the exhibitors.

Book Notices.—"Sell's Directory of Registered Telegraphic Addresses." Pp. 2,944. London: Business Dictionaries, Ltd. Price 45s.—This is the forty-first edition of this very useful guide, which is compiled from information received by the General Post Office. The original edition contained about 40,000 names; there are now 100,000, and the classified trades section has expanded correspondingly. In addition to the main object of the publication, a great amount of other useful commercial information is included.

"*The Engineer* Directory and Buyers' Guide, 1926." London: The Engineer, Ltd.

"Military Engineering" (Technical Training). Vol. II: Electrical Engineering.—A set of some 70 amendments to this volume has been issued by the War Office, and can be obtained from H M. Stationery Office, price 2d. net.

"*The Transactions* of the South African Institute of Electrical Engineers." Vol. XVI, Part 12. January, 1926. Price 2s.

For Sale.—Bexhill Corporation Electricity Department has for disposal four Babcock & Wilcox boilers, two condensers, two Weir pumps, induced draught plant, &c. Messrs. Allan Arthur & Ure invite offers for a duplicate electric lighting and power generating plant now in use in Ireland. Manchester Corporation Electricity Department has for disposal six induction motor-generating sets. Aberdeen Corporation Electricity Department invites offers for two 250-kW and one 100-kW Peebles-La Cour motor converters, one 30-kW Westinghouse motor-generator, six 220-V d.c. motors, &c. (See our advertisement pages to-day.)

Radio Development in Ecuador.—*Commerce Reports* quotes an "unofficial" statement to the effect that the Government has approved the proposal of a Guayaquil firm granting it the exclusive right to import radio-telephone apparatus for a period of five years, and to erect broadcasting stations at Quito and Guayaquil. The net profits accruing are to be divided equally between the concessionaires and the Government.

The A.E.G. Report.—Supplementing the information given in our issue of February 19th concerning the activity of the Allgemeine Elektricitäts Gesellschaft during the year ended September 30th, 1925, we find from a copy of the report which is now available that the directors state that the conditions of the times are difficult and the future cannot be foreseen. Although the necessity for electrification throughout the world is no longer in doubt and the electrical industry is therefore in a better position than many other industries, it is naturally dependent upon the general economic situation both in Germany and abroad. Exportation is difficult and rendered unprofitable by the protection policies of over-industrialised countries. In oversea countries the competition of all other countries is being experienced. On the other hand, Russia is a promising market, but the business can only be extended gradually and in accordance with the availability of funds in that country. Dealing with the company's activities, the report states that among the orders executed by the large machine works was one for four 29,000-kVA, 12,000-V generators for Norway, which were the largest machines hitherto produced. In the Oberspree cable works extensions of the plant were made for the manufacture of telephone and telegraph cables, although a good demand also prevailed for light and power cables. The manufacture of 60,000-V cables according to the principle of "metallised cores" was taken up and the production of larger cable lengths undertaken. The development of long-distance cables made notable progress in both the technical and economical respects. Concerning the turbine department the report states that it was possible to increase the size of turbo-generators running at 3,000 r.p.m. to 30,000 kVA. In central station work the most important order was one from the Berlin municipal electricity supply works for the establishment of a complete power station at Rummelsburg of an initial capacity of 240,000 kW. In this station there will be installed three generating sets. Steam will be supplied by 16 boilers fired with pulverised coal. Transformers will be installed to step up the pressure from 6,000 V to 30,000 V. After referring to other turbo-dynamo equipment in hand the report mentions that orders have been received for h.p. transformers up to an individual capacity of 44,000 kVA, while the total capacity of the transformers ordered in 1924-25 exceeded 1,000,000 kVA, and contracts were also booked for extensive switching installations for power and converter stations for pressures up to 100,000 V. In the electrical distribution branch the company carried out for various undertakings the construction of h.p. long-distance lines and the selective protection afforded by the Biermann distance relay was put into service in numerous cable and overhead line networks and had fulfilled expectations. The report also refers to orders on hand for ships' plant of a total of 50,000 h.p.; the construction for the Phœnix Steel Works of a reversing train drive of a capacity of 25,000 h.p. for the ingot mill at Ruhrort, which is more powerful than any hitherto carried out; and orders for electric steel furnaces on the Fiat system representing a total of 64,000 kVA.

The Value of Trade Fairs.—Modern fairs and exhibitions differ widely in outward appearance from those of the Middle Ages, but the fundamental aims and methods of their conduct remain much the same. Although the development of transportation and other means of communication has tended to limit somewhat the importance of fairs as media for the distribution and sale of certain commodities, such as raw materials, they continue to be important in the distribution of manufactured articles and in the dissemination of advertising propaganda. New lines are quickly introduced at fairs and exhibitions, and the manufacturer is enabled to determine the market possibilities of his product at a minimum cost and with the least possible delay.—*Commerce Reports.*

The Newcastle Lighting Service Bureau.—The North-East Coast Lighting Service Bureau is doing very satisfactory work at Newcastle. Considerable interest has been aroused in the district and lectures are being attended by institutions and associations of various kinds, chambers of trade, shop-

Lecture Room at the Newcastle Lighting Service Bureau.

keepers, domestic science students, &c. During last week an exhibit was made at an electrical exhibition at Thirsk. We reproduce herewith a photograph of the lecture room at the Bureau.

Jugo-Slavian Electrical Imports.—The total importation of electrical machinery into Jugo-Slavia during 1924 was valued at approximately £267,000.

The Italian Electrical Market.—The French Commercial Attaché in Italy has been investigating the prospects for the sale of electrical machinery and apparatus in that country, and the results of his inquiries were the subject of a recent article in the *Moniteur Officiel du Commerce et de l'Industrie*. The following is a summary of some of the chief points of the report:—

The Italian electrical manufacturing industry, although it has improved its position during the past few years, is not very prosperous. It uses a large quantity of sheet iron, steel, and special castings, on which, in many instances, import duties are levied. As a result, the industry pays dearly for much of its raw material. The comparatively strong position of the wire and cable makers who employ little iron or steel is quoted as evidence of the burden which the heavy electrical industry has to bear owing to the import tariff. Consequently the Italian builders of large generators and motors do not find it easy to quote competitive prices, and Germany has been rapidly regaining her position in the Italian market, which was temporarily held by Great Britain and the United States.

Two German electrical manufacturing firms have reopened branches which were closed during the war, and are now able to give quick deliveries. There is a good sale for motors suitable for textile mills. At the same time, the exports of generators and motors have been increasing.

Italy's imports of transformers are considerably in excess of her exports. In 1925 (seven months) 783 tons came in from abroad, compared with 666 tons in the previous twelve months, whilst exports totalled only 99 tons during the seven months, as against 177 tons in the year 1924 and 359 tons in 1923. Prior to 1920 no exports were recorded. There is a growing importation of accumulators, but a decreasing exportation. Numbers of Italian makers have specialised in the production of accessories, such as switches, valves, and regulators. Imports of measuring instruments are, however, large. Italy is a large producer of copper conductors, plates, and bars for electrical purposes, imports being to a large extent restricted to material supplied to concerns in Italy under the control of foreign capital. Nickel-chrome wires and plates

are supplied by Great Britain and the United States, with a good deal of competition from Germany. France also has hopes of capturing some of this trade. In insulated wires, importation is difficult in the face of the home production. About 1,500 tons of porcelain insulators were imported last year, against 2,290 tons in 1924, Germany being the chief supplier.

The Leipzig and Cologne Fairs.—*Reuter* reports that the number of visitors to the Leipzig Fair considerably exceeded expectations, being estimated roughly at 140,000, including 20,000 foreigners. The number of exhibitors amounted to 10,300. The business done turned out in many branches substantially better than had been hoped in view of the economic situation. In particular, the export business in the technical section and in china, glass, stone and wooden goods was in some cases fairly good. Home trade, at any rate so far as the main articles of consumption were concerned, still showed a quiet appearance, which was attributed to unemployment and the country's poor purchasing power. On the other hand, a later report states that an official notice issued by the management of the Cologne Fair says:—"As the Leipzig Fair has served only to confirm the prevailing export crisis in German industries, the Spring Fair in Cologne will be cancelled. Only one fair will be held in 1926, the Autumn Exhibition, opening on September 12th and continuing till September 19th."

Chinese Notes.—The Foochow Electric Co. is installing a suburban lighting system extending from the company's station to Tamensiang, Siaomensiang, Howyusiang, Kushan, and Kweikisiang. The last place is 20 li (about 7 miles) from Foochow.

Work has been commenced upon a telephone service between Shanghai and Sungkiang, a distance of 21½ miles, and is expected to be completed during April or May.

Twelve Years at the Equator.—The Sultan of Zanzibar has had a Hart electric lighting battery in use at the Royal Palace for the past twelve years. It is noteworthy that a battery should continue to give satisfactory service after a long period so near to the Equator.

Lighting and Power Notes.

Amble.—Electricity Charges.—The Urban District Council is to introduce the following new tariff for heating and cooking:—A fixed charge of 20s. for each winter quarter and 10s. for each summer quarter, plus 1d. per kWh for all electricity consumed. The charge for lighting is to be reduced by 1d. per kWh as from April 1st next.

Australia.—Corowa (N.S.W.).—The electricity supply for the district was formally inaugurated by Sir J. Monash, chairman of the Victorian Electricity Commission, on February 1st. This marks an important stage in the development of the Yallourn scheme, the distance from the point of generation at Yallourn to the distributing area in New South Wales being 277 miles. The transmission line to Albury is nearing completion. The length of the line will be 290 miles.

Bacup (Lancs.).—Electricity Extensions.—The Town Council proposes to borrow £13,000 for mains and services.

Barnes.—Electricity Extensions.—The electrical engineer has submitted to the Urban District Council a programme of e.h.p. and l.p. feeder and distribution main extensions to be carried out during the forthcoming summer, involving an expenditure of £11,126.

Beckenham.—Electricity Supply.—At a recent meeting of the Electricity Committee the electrical engineer reported that within the next year it would be necessary to install additional turbine plant, but before the necessary sanction was obtained it was incumbent upon the Council to inquire of the Joint Electricity Authority whether it was in a position to afford a partial or bulk supply on more advantageous terms. The Committee has authorised its officials to make the necessary inquiry.

Electricity Charges.—The Committee has agreed that power consumers shall be allowed to consume an equivalent of 10 per cent. of their quarterly power consumption for lighting at power rates, provided that the power consumption during the quarter is not less than 2,000 kWh.

Bristol.—Electricity Extensions.—In consequence of the increasing demand for electricity at Avonmouth, the Corporation Electricity Committee states that it is necessary to lay additional mains or to raise the pressure of the existing ones, and has recommended that the pressure from Feeder Road be raised to 11,000 V. The cost of transformers, switchgear, and equipment necessary amounts to £24,300, to which must be added the sum of £17,687 for connecting up the existing distributing centres in accordance with the model scheme, making a total of £41,987. The Committee also reports that it is necessary to increase the pressure of certain feeders between Feeder Road and the Ashton district from 6,000 V to 11,000 V. The estimated cost of the work is £2,941. The Committee has recommended that the works be carried out and that it be authorised to apply for sanction to the borrowing of £41,987 and £2,941 respectively.

Continental.—Denmark.—*Commerce Reports* states that there were 479 power stations operating in Denmark during the fiscal year 1923-24, according to a recent survey prepared by the Danish Statistical Department. Of these 121 were city plants and 358 were situated in rural areas. Although practically all of the city plants were constructed prior to the war, nearly one-third of the rural plants were erected during or since the war. The capacity of the plant installed increased from 190,000 to 228,000 h.p. during 1923-24. Of this increase steam installations accounted for 26,000 h.p. and Diesel plant for 12,000 h.p. During the year under review the output amounted to 231,000,000 kWh.

Spain.—The Barcelona correspondent of the *Daily Mail* reports that the Minister of Public Works states that 14,000,000 h.p. is available in the River Ebro basin and the State will undertake works which will make the river navigable, harness the water, and irrigate lands. The Government will spend 300 millions spread over ten years, with the object of obtaining more than 1,000,000 h.p. and enabling 2,000,000 acres to be irrigated. The electrical energy will be used for railway electrification.

Czecho-Slovakia.—According to *Commerce Reports* there was increased activity on the part of the Government and the municipalities of Czecho-Slovakia in the development of the water-power resources of the country during the past year. The 1926 programme of the Ministry of Public Works includes the completion of the hydro-electric stations in Nymburk, Kolin, Prelouc, and Mirejovice, as well as the construction of a reservoir on the Elbe near Verde, and the building of a dam and a hydro-electric station in Uzhorod. Other work will also be undertaken in various sections of the Republic. An appropriation of 25,000,000 crowns has been set aside for this work.

France.—A concession has recently been granted for the establishment of a hydro-electric station at La Llau in the Eastern Pyrennees to utilise the water power of the River Coumelade.

Italy.—Concessions in respect of new hydro-electric stations have recently been granted to a syndicate at Civetella Roveto (province of Aguila) to utilise the water power of the River Fucino to the extent of 10,250 h.p. and to the Società Idroelettrica Cisalpina to utilise the River Mara to the extent of 29,960 h.p. at Villa di Chiavenna (Sondrio province).

It is reported from Rome that in order to encourage the more rapid development of the hydro-electric resources of Southern Italy, Sicily and Sardinia, the Italian Government proposes to grant a subsidy of 60 lire per nominal h.p. in respect of any new power stations put in hand before the end of 1928. A subsidy of 40 lire per h.p. is also to be offered in respect of new hydro-electric plants in other parts of the country.

Dewsbury.—Electricity in Bulk.—The Town Council has decided to take a bulk supply of electricity from the Yorkshire Electric Power Co. for the Ravens Lodge housing site.

Doncaster.—New Plant.—The Town Council has approved a scheme submitted by the Electricity Committee for extensions to the generating station, including the provision of a 6,000-kW turbo-generator with condensing plant, &c., boiler house extensions, water tube boilers and high-pressure switchgear and cables, at an estimated cost of £57,135; and a 1,000-kW converter with h.p. and l.p. switchgear and cables (£5,915). Application is to be made for sanction to the borrowing of these sums for the purposes mentioned.

East Ham.—Electricity Extensions.—The Electricity Committee is to lay two feeder cables to Manor Park at an estimated cost of £14,500.

Gravesend.—New Electricity Charge.—The Corporation has approved a recommendation of the Electricity Committee that from January 1st, 1926, the following new tariff shall be introduced:—A fixed quarterly charge of 1/40th of the annual rateable value of a house, plus ¾d. per kWh for all electricity consumed.

Loan Sanctioned.—The Corporation has received sanction to a loan of £40,000 for plant extensions at the electricity works.

Holbeach (Lincs.).—Electricity Scheme.—The Urban District Council has approved a draft agreement with the Boston and District Electric Supply Co., Ltd., for a supply of electricity to the town. The Council has an option to purchase the undertaking at the end of 21 years.

Irish Free State.—Castlerea (Co. Roscommon).—The town is without street lighting as the Castlerea Lighting & Milling Co. has declined to light the street lamps any longer at a loss. The ratepayers paid 6d. in the £ to defray the cost of the public lighting, while the sum of £60 was contributed for the purpose by the Castlerea Power Trustees annually. The contract with the company for the lighting of the street lamps was £130 a year. The trustees are not now in a position to contribute more than £20 a year, and the ratepayers decline to pay more than 6d. in the £. The company states that it was carrying out the lighting of the streets at the minimum figure, and could not now do so at a loss of £40 a year.

Leeds.—Loans.—The Corporation Finance and Parliamentary Committee has under consideration a recommendation of the Electricity Committee that sanction be sought to borrow £50,000 for sub-station equipment and £10,000 for the erection of a new sub-station.

Lincoln.—Loan.—The Town Council has applied for sanction to a loan of £17,400 for electricity purposes.

Liverpool.—Electricity Supply Progress.—Members of the Electric Power and Lighting Committee recently inspected the Lister Drive power station and saw the buildings being prepared for the reception of five new turbo-alternators, one of which, rated at 25,000 kW, is now in service. The cost of the work, when completed, apart from the machinery, will be

£500,000. The chairman of the Committee stated that additional demands received during the past month for electricity for lighting, heating, cooking, &c., had averaged 1,000 kW per fortnight. There were now 1,344 cookers in operation. During the past six months 550 extensions of mains had been approved at an estimated expenditure of £140,000, while £30,000 had been approved for h.p. mains and £75,000 for mains on housing estates. The number of consumers connected was 41,160, and total connections, excluding tramways, were equivalent to 110,195 kW.

London.—Hammersmith.—The Electricity Committee has recommended to the Borough Council that the following two alternative schemes for the wiring of premises be adopted:—(*a*) Hire scheme: A fixed quarterly charge varying from 3s. 6d. for 4 points to 9s. for 16 points for lighting supply, and from 2s. 6d. for 1 point to 7s. for 5 points for power supply. (*b*) Hire purchase scheme: A fixed quarterly charge based on actual cost of installation, plus 10 per cent., together with interest at 5 per cent., per annum, on balance outstanding. The standard rates for electricity consumed will be charged in addition to the fixed quarterly charges. The Committee has also recommended that a sum of £1,000 be set aside out of the accumulated profits of the undertaking for financing the scheme.

St. Pancras.—The Electricity and Public Lighting Committee has considered a report from the borough electrical engineer on proposed additional plant to meet the increased demand for electricity, and has recommended to the Borough Council that the consent of the Electricity Commissioners be obtained to the installation of three 2,500-kW motor converters and one 10,000-kW generating set, with accessories, at a total estimated cost of £72,500; the provision of an additional sub-station at an estimated cost of £25,000; and that £2,500 be provided for contingencies in connection with the sub-station. The Committee has also recommended that the Crown Estate Paving Commissioners and H.M. Office of Works be informed that the Council is prepared to provide, maintain, and light 176 street lamps in the neighbourhood of Regent's Park and Primrose Hill, at an annual charge of £4 7s. 6d. per lamp, subject to an agreement being entered into covering a period of 10 years. The estimated capital cost of the scheme is £3,135.

Newport (Mon.).—Wiring of Small Houses.—The Electricity Committee has adopted a scheme of assisted wiring for small houses submitted by the electrical engineer.

Meter Rental Charges.—The Committee has also approved a recommendation that the meter rental charges for lighting be reduced to pre-war basis, and that the meter rental charges for heating and cooking purposes be discontinued.

Normanton.—Loan.—The Urban District Council is applying for sanction to a loan of £15,600 for sub-station plant, mains, services, and meters.

Northern Ireland.—Coleraine (Co. Londonderry).—The Urban District Council has decided to apply for sanction to a loan for £22,000 for an electricity scheme for the town, and an agreement is to be drawn up with Mr. A. Leigh, consulting engineer.

Padiham.—Electricity in Bulk.—The Town Council met recently to decide upon the operation of the Electricity Order. Mr. Wood, electrical engineer, of Bolton, attended, and he advised on three alternative schemes. The Council decided to take a supply in bulk, and to carry out the distribution of electricity itself.

Preston.—Electricity Supply.—At a meeting of the Town Council on March 11th, consideration was given to the question of a transmission line between Preston and Blackpool and the Council confirmed a resolution that the cost of this line should be increased from £66,000 to £87,500. The Chairman of the Electricity Committee said the first scheme was to give effect to a load of 10,000 kW. At that time the Blackpool station was becoming loaded up and the demand for electricity on the coast was increasing. Difficulties had been overcome and an agreement had been arranged with Blackpool for the next 20 years which provided that the seaside town should take at least 5,000 kW. With a possibility of growth, Preston was faced with the alternative of having to duplicate its line within a few years, and so it had decided to make better provision at the present time. The ultimate total cost would reach £125,000 but this would be the only expenditure required for some years, and Blackpool was willing to pay half the extra cost.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Monaghan.—Lighting: From 1s. 2d. to 1s. per kWh.

East Ham.—Private lighting: From 6½d. to 6d. per kWh.

Salford.—Power: A reduction of approximately 8 per cent.

Dover.—Lighting: From 8½d. to 7½d. per kWh.

Sandwich.—Electricity Supply.—The Town Council is to approach Messrs. Pearson & Dorman Long, Ltd., with regard to a supply of electricity for the town from the power station at Stonar.

Scarborough.—Electricity Supply.—The Council is to apply for powers to supply electricity for all purposes within the borough and adjacent districts. The maximum price for electricity is to be 10d. per kWh.

Spalding.—Electricity Supply.—The Boston and District Electric Supply Co., Ltd., has offered to give the Urban Council a supply of electricity in bulk at £4 10s. per kVA of maximum demand per annum, plus .75d. per kWh. This offer is to be considered by the consulting engineer, together with one from the Peterborough Corporation.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following: The Weston-super-Mare and District Electric Supply Co., Ltd., for the supply of electricity in the parish of Uphill; Mr. J. A. Purves, for the supply of electricity in the urban district of Burnham-on-Crouch, and certain parishes in the rural district of Maldon.

The Gainsborough Urban Council has received intimation from the Electricity Commissioners that its application for a Special Order has been granted.

West Bromwich.—Electricity Supply.—The Town Council has decided to proceed with the laying of main transmission lines in connection with the West Midlands Electricity District at an estimated cost of £17,926, including boxes, transformers, temporary buildings, &c. The mains and equipment will be transferred to the Joint Authority.

Tramway and Railway Notes.

Aberdeen.—Purchase of Undertaking Declined.—In connection with the proposed purchase of the tramway undertaking of the Aberdeen Suburban Tramways Co., by the Town Council, the Tramways Committee decided at a recent meeting that no further action should be taken in the matter.

Bradford.—Railless Cars.—The Tramways Committee is applying to the Ministry of Transport for sanction to the erection of overhead equipment in Brewery Street for the contemplated Lidget Green and Clayton railless-car service.

Through-Car Services.—The Tramway Committee has decided to experiment on the Shelf and Bailiff Bridge routes with through-car services. The scheme will, it is expected, make it possible to put fewer cars on the long-distance routes and more cars on the short distance and more crowded routes, and if proved successful will be extended to other routes.

Canada.—New Electric Railway.—According to *The Times*, the Ontario Hydro-Electric Commission is conferring with the municipalities concerned on a proposal to construct a high-speed radial railway from Toronto to Hamilton at a cost of $11,000,000.

Continental.—Switzerland.—With the addition of a fifth unit at the Amsteg power station of the Swiss Federal Railway authorities the completion of the programme of construction covering the power requirements for railway electrification up to 1928 has been achieved, in so far as the Amsteg-Ritom group of generating stations is concerned. In order to fully utilise the Barberine reservoir, the erection of the power station at Chatelard is being followed by one at Vernayaz. The plant will include three 14,000-kVA generators. An interconnecting line operated at 130,000 V will link up the Amsteg-Ritom and the Barberine-Vernayaz systems.

Belgium.—The Société Nationale des Chemins de Fer Vincinaux, of Brussels, proposes to electrify an additional number of its lines in the province of Antwerp during the present year as well as to construct a number of new short electric railways, including one from the existing terminus at Hoogboom to the frontier at Putte. In the eastern part of the province the first line to be electrified will be that between Antwerp and Schilde. Plans are also being prepared for the electrification of the Antwerp-Malines and Boom-Pierre local railways.

Heywood.—New Route.—According to the *Manchester Guardian*, it is proposed to construct a tramway connecting the municipal service at Hopwood and the Manchester Corporation tramway at Middleton.

India.—Railway Electrification.—The electric train service of the Great Indian Peninsula Railway from the Victoria Terminus, Bombay, to Bandra, was inaugurated on February 3rd.

London.—Underground Junction Completed.—According to *The Times*, a scheme which will have the effect of doubling the most important section of the Inner Circle was completed by the Metropolitan Railway on March 15th. A duplicate service of electric trains is thus provided for the first time over lines hitherto operated solely by steam trains. The Metropolitan Railway has been engaged for some months in constructing a junction to a point east of Euston Square, to link up a length of disused tunnel extending to King's Cross. It is now possible to switch over Metropolitan trains from the Inner Circle to the widened lines and thus secure an alternative route to Moorgate. The widened lines from King's Cross to Moorgate, over which the steam trains of the Great Northern section of the London and North-Eastern Railway and the Midland section trains of the London, Midland and Scottish Railway now run, have been electrified. Control of the junction of the new line with the existing Metropolitan track near Euston Square will be effected by means of electrical apparatus in a signal box at King's Cross, nearly 700 yards away. From this box also will be worked the junction points with the L. & N.E. and the L.M.S. Railways. With the opening of the new junction a number of through Metropolitan trains can be diverted over the widened lines to Moorgate. This enables the through trains to be expedited in both directions.

L.C.C. Tramcar Improvements.—The Highways Committee of the L.C.C. has recommended, with a view to eliminating the swaying motion of the four-wheeled type of tramcar, that 188 cars be equipped with an improved form of suspension gear at an estimated cost of £5,250.

Manchester.—Proposed Underground Railway.—The Manchester *Daily Dispatch* reports that it is expected that the report of the Underground Railway Committee of the City Council will be issued shortly. For the last two years this committee has been considering the city's traffic problem. It is not known at the moment what form the recommendations of the Underground Railway Committee will take, but it is expected that a scheme for linking up London Road, Central, Victoria, Exchange, and perhaps Oxford Road stations with an inner circle of electric underground lines, to form the nucleus of a bigger system, will be advanced. The first development of this will probably be extensions to Chorlton, Didsbury, Withington, and, on the other side, to North Manchester suburbs. The total cost of the scheme would be over £4,000,000.

Kent (Surrey).—Light Railway Inquiry.—According to the *Daily Mail*, proposals for a light railway 15 miles in length, to connect Orpington, near Chislehurst, Kent, with Sanderstead, near Croydon, Surrey, were outlined at a Ministry of Transport inquiry at Orpington recently. Col. H. M. Midder, for the promoters, said it was expected that the railway would develop the district as a residential suburb of London. The Southern Railway was willing to work the line and run electric trains from and to Charing Cross and London Bridge. Sir Herbert Walker, general manager of the Southern Railway, said that if an order were made and the promoters and the Southern Railway came to a satisfactory working agreement his directors would guarantee the interest on the debentures, £300,000. The capital would be about £300,000, and included in it was the cost of electrification, which was between £130,000 and £140,000. His board would find the capital for the electrification and take payment of it in shares, either preference or ordinary, as might be decided.

Telegraph and Telephone Notes.

Australia.—Naval Radio-Telegraphy.—With a view to improving the wireless communication services of the Royal Australian Navy, short-wave, continuous-wave apparatus is undergoing preliminary tests. A proposal that a strong naval communications reserve should also be formed is being considered. Though no definite action is likely to be taken for some time, it is likely, says the *Sydney Morning Herald* that the naval authorities will invite experienced amateurs who have pioneered short-wave work in Australia to join the naval wireless reserve.

Canada.—Marconi Operators' Strike.—The Marconi operators, through their Union Committee, have been assured of the continuance of the existing wage rate until April 1st, 1929. An agreement to this effect has been signed by the Marconi Company.—*Reuter* (Montreal).

Chile.—Telegraph Service.—The Chilean Government is reported by *Commerce Reports* to be interested in the purchase of the Commercial Telegraph Co.'s properties. That the report may be well founded is apparent from the fact that, at a meeting of the board of directors of the Commercial Telegraph Co. it was agreed to authorise an individual to enter into an *ad referendum* contract for the sale of the properties for $8,250,000 (paper). It is understood that the Government hopes to combine with the State telegraph service certain lines of the Commercial Telegraph Co. and in other places to avoid competition by these lines.

China.—Foreign Cable Dues.—With reference to the recent decision of the foreign Cable Companies not to accept any but Government telegrams dispatched from the administrations in the Yangtse Valley provinces, which may be handed over to the Companies by the Chinese Telegraph Administration in Shanghai, unless such messages were accompanied by cash, *Reuter's* correspondent is informed that the Chinese Telegraph Administration is now settling accounts half-monthly. So long as such settlements continue, telegrams will be forwarded in the usual way.

Empire Communication.—Press Union Resolutions.—A meeting of the Council of the Empire Press Union was held on March 12th to consider the resolutions adopted at the Imperial Press Conference held in Australia last autumn. Sir Robert Donald, chairman of the Council, presided, and he was supported by Lord Burnham, president of the Union. Regret was expressed at the delay in the erection in England of "beam" radio stations. Reference was also made, says *The Times*, to the Pacific Cable Board's intention to employ "loaded" cables in duplicating the Pacific channel, and the decision of the Western Union Telegraph Co. to lay a new "loaded" cable across the Atlantic; in view of the increased capacity afforded by "loaded" cables, it was decided that the Imperial Government be requested to take early steps to lay a new "loaded" cable across the Atlantic, and, in the meantime, to hire two channels from the Western Union Telegraph Co., so that full advantage might be taken of these new facilities. The motion to refer the resolutions to the Union's standing committee on cable and wireless communication was carried, and a special committee was appointed to watch the development of broadcasting and to co-operate with the standing committee.

Radio-Telegraphy.—West End Office.—A new telegraph office was opened on March 15th by Marconi's Wireless Telegraph Co., Ltd., at 20, Duke Street, Piccadilly, where telegrams may be handed in for transmission by high-speed wireless telegraphy to France, Spain, Austria, Switzerland, Canada, the United States, Bulgaria, Jugo-Slavia, and other parts of the world. The new office will conveniently serve the telegraphic requirements of the West End of London.

Switzerland.—Telephone Service.—The telephone service between Switzerland and France has been much improved this year, thanks to the opening of several new circuits. Since January no fewer than three new cables have been put at the disposal of Geneva, with a view of facilitating communication with the League of Nations, thus affording three wires for direct calls between Paris and Geneva. Berne, too, can now 'phone direct to Paris, except during certain hours, and for three weeks or so Zurich has had direct communication with Paris, much to the advantage of business men. As soon as the cable linking up Paris, Strasbourg, and Bâle is available to the public, further improvements in the Swiss service may be expected, and the new automatic 'phones are giving universal satisfaction. The public is being asked to criticise the present arrangements, and with but few exceptions little or no criticism is forthcoming.

The Telephone Service.—London-Germany Service.—A preliminary night telephone service was inaugurated on March 15th between London and Berlin, Hamburg, Bremen, Cologne, and Frankfurt. As the Continental sections of the lines to these towns are utilised for other purposes during the daytime, the service will be restricted to the hours 6 p.m. to 7 a.m. The charges for a three-minute call are considerably less than the normal day rates.

United States.—Telephone Timing.—A novel long-distance telephone economy has been adopted in the United States, where the canvassing of customers in distant parts by means of the telephone is now a recognised commercial practice. Salesmen of the H. J. Heinz Company, food manufacturers, use a small minute glass which they reverse as soon as telephonic contact with the client has been established. By this means they are able to regulate their calls so that full advantage is taken of every second, and the extra three-minute charge for a sentence or two is avoided. The glass is much more convenient and less distracting than the seconds hand of a watch. It costs only a few pence and saves many pounds a year.

Radio Notes.

Australia.—Licence Fees.—Since the inception of broadcasting in Australia about 18 months ago the amounts collected in licence fees are: New South Wales, £88,986; Victoria, £61,882; Queensland, £6,119; South Australia, £12,691; Western Australia, £8,960; Tasmania, £1,679.—*Reuter's Trade Service* (Melbourne).

Licences.—Number and Revenue.—Sir W. Mitchell-Thomson, Postmaster-General, in reply to a question in the House of Commons, said the total amount of fees for receiving licences collected up to the end of February, 1926, was approximately £2,147,000. The amount already paid to the British Broadcasting Co. was £1,114,000. The number of licences in force on February 28th last was approximately 1,906,000, as compared with 1,258,000 on February 28th, 1925.

Russia.—Manufacturing Output.—The radio sub-section of the Supreme Economic Council has had considerable difficulty in fixing the capacity of the Soviet market for wireless material owing to the absence of previous years' experience, but, after a study of the various branches and of the Western Europe and American markets, the value (according to present prices) of the output of radio articles in the Soviet Union is estimated as follows:—For the year 1925-26, 20,163,000 roubles; 1926-27, 29,732,000 roubles; 1927-28, 40,058,000 roubles; 1928-29, 53,115,000 roubles; and for 1929-30, 68,625,000 roubles. Owing to reduced costs of production, the amounts for 1926-27 are expected actually to be lower. In order to attain this output it will be necessary to extend the existing works, open the Nizhni Novgorod workshops as from 1926-27, and build a new works for the mass production of simple receiving sets to start activity in 1928-29.—*Reuter's Trade Service* (Moscow).

Wave-length.—Readjustment.—On March 11th, the following wave-length alterations were made at the instigation of the International Radiophony Bureau, Geneva, in order to avoid interference between stations:—

England.—Newcastle from 404 to 407 m., and Bournemouth from 386 to 387 m.

Austria.—Graz from 397 to 402 m.

Germany.—Breslau from 418 to 417 m.; Münster from 410 to 412 m.; and Hamburg from 395 to 392 m.

Irish Free State.—Dublin to 397 m.

The changes are not necessarily permanent, their retention depending on the working of the rearrangement.

Porcelain Insulator Manufacture.

Impressions of a Visit to Messrs. Taylor, Tunnicliff & Co.'s Staffordshire Factories.

(*Concluded from page* 384.)

It will have been gathered from the first instalment of this article that, as compared with ordinary potting, the business of insulator-making is highly technical, necessitating the use of specially-prepared clays, special machinery, and most accurate workmanship; in fact, a large staff of skilled mechanics is kept constantly employed in constructing and renewing machinery, the size of the busy tool room being more suggestive of the engineering trade than of the ceramic industry. Testing facilities are, of course, an essential feature of such an organisation, for they afford the means of determining whether the potter's products have been rendered homogeneous throughout and thoroughly well vitrified in order that, apart from more mechanical strength, their electrical insulating properties may be depended upon under diverse climatic and other variable conditions, irrespective of the glaze.

Fig. 15.—A View of the Extra-high-pressure Testing Department.

In contrast to the transformer outfit (capable of furnishing a maximum pressure of only 60,000 volts) in use when we described the works 18 years ago,* the extra-high-voltage equipment installed at the Hanley factory now includes a 300-kVA, 300,000-volt, single-phase Ferranti transformer (figs. 15 and 16) fed from a 70-h.p. G.E.C. motor-generator that is capable of furnishing 150 kVA for short periods. A pure sine wave is obtained at frequencies of from 25 to 100 cycles per second. The G.E.C. control board is enclosed in a wire cage, the doors of which are interlocked with the oil switches for the protection of the operators. Some of the results obtained by the application of high electrical pressures are indicated by the accompanying reproduced photographs: Fig. 18 is a view of a 66,000-volt pin-type insulator flashing over dry at 165,000 volts; figs. 19 and 21 show 300,000-volt dry flashovers on a string of five 7-in. diameter suspension units, and the influence of arcing horns on the flashover path will be noted; fig. 20 shows a string of six similar units under artificial rain, the voltage in this case being about 200,000 volts.

Suitability of electrical design is gauged by dry and wet flash-over tests. In the latter case, samples are subjected to artificial rain equivalent to one inch in five minutes, directed downwards at an angle of 45 deg.; both the temperature of the water and its specific resistance are important factors. To determine the dielectric strength, insulators can be punctured under oil, and this test can be made, if necessary, at any temperature up to 100 deg. C., arrangements being available to heat the oil to this temperature and to heat the insulator previous to immersion; the oil tank used for this test can be seen in fig. 17. Other electrical equipment includes a high-frequency outfit (100,000 volts at from 50,000 to 200,000 cycles per second) of the oscillator pattern similar to a spark radio-telegraph transmitter. This outfit is illustrated in fig. 22, the motor-driven rotary spark-gap being visible on the right-hand side in front of the condenser box.

Fig. 23 shows porcelains for 10-in. suspension insulators undergoing a high-frequency test (80 kV), and it will be noted that the insulators are inverted in water, the reflection indicating how the discharge clings to the porcelain.

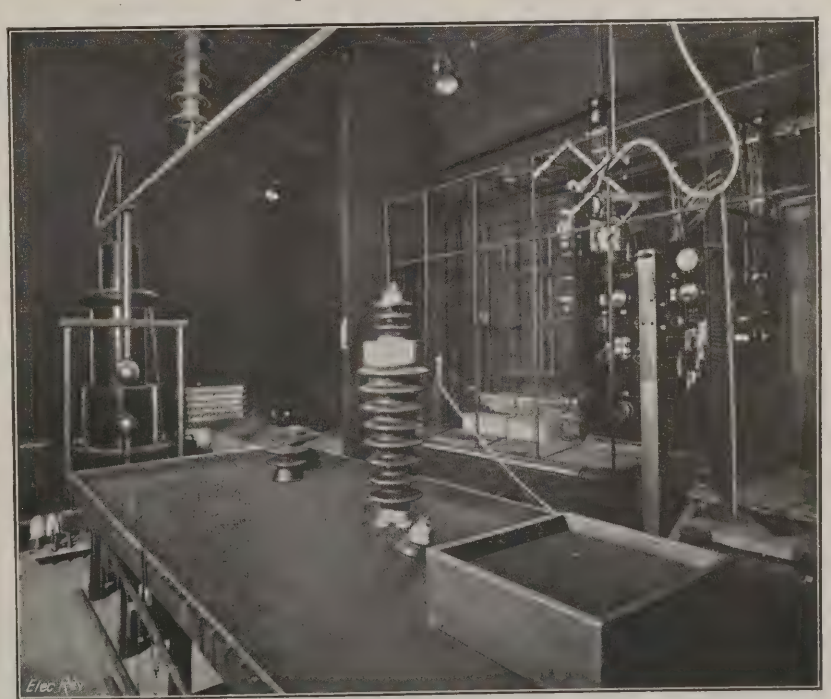

Fig. 16.—Testing Department, showing Switchboard and 300,000-V Transformer.

The current an insulator will allow to pass from the conductor to the earthed metal work under the influence of an alternating voltage is made up of the leakage (i) over the surface, (ii) through the body, and (iii) the capacity current through the porcelain dielectric. Nor-

* See Elec. Rev., March 6th, 1908, pp. 401 to 405.

mally, these currents are very small, but, since a spark is a conductor, they become excessive when a flash-over occurs. A well-designed porcelain insulator will always flash over without damaging itself and without puncturing. The chief factor governing the flash-over voltage and path is the distribution of the electric field and its relation to the contour of the insulator. When the insulator is correctly designed there is no appreciable formation of corona prior to flash over. In general, the best distribution results when the contour of the main "trunk" of the insulator conforms to one of the lines of force of the dielectric field, while the surface of the sheds follows the equipotential planes at right angles to the lines of force.

Other tests are also made to prove the suitability of the porcelain: One of them is known as the test for inherent stresses, and consists of immersing the insulator, or insulators, for one hour in water at 50 deg. C., followed by a similar period of immersion in ice and water, after which the dry flash-over test is applied. The insulator is only considered satisfactory if it can stand this test being repeated three times. It is important to know whether the porcelain shows any sign of porosity, and the test for this consists of immersing broken pieces in a 0.5 per cent. alcoholic solution of fuchsin dye under a pressure of 2,000 lb. per sq. in. for 24 hours; good porcelain shows no sign of penetration.

Fig. 19.—A 300-kV Dry Flash-over.

Fig. 20.—A 200-kV Wet Flash-over.

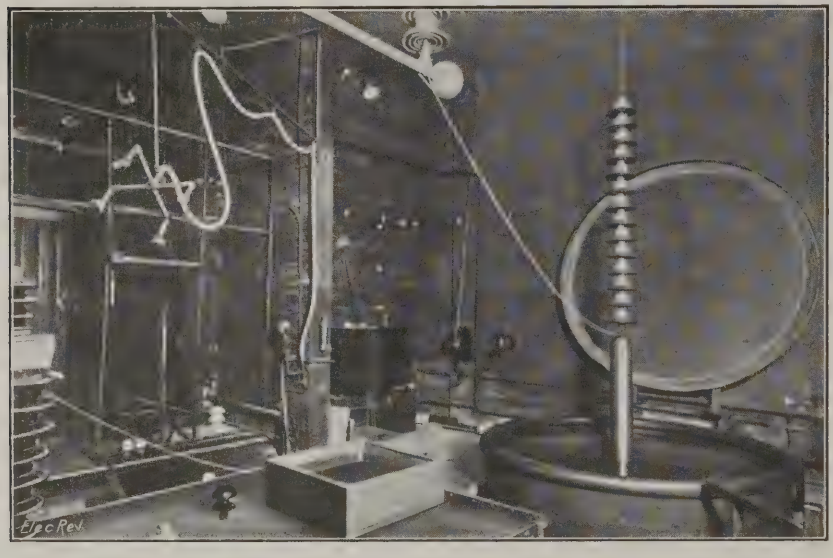

Fig. 17.—Oil Tank for Puncture Tests.

work, coal-fired Lancashire boilers are installed at all the factories, but before the steam is utilised for heating purposes it is passed through horizontal reciprocating engines which drive some of the machinery and vertical high-speed engines which drive d.c. generators for lighting and feeding motors in the works. At the Hanley works the power requirements are in excess of the steam demand, the difference being met by the use of town's gas engines. Thus it may be said that power and electricity are generated almost as by-products, but the subject is receiving attention at the moment, and it is probable that in the near future all the electricity needed will be purchased from the local municipal undertaking.

Although steam and electric power have been and are being utilised to a considerable extent, the first, and one of the most important, operations in the manufacture of an insulator dates back to one of the oldest, if not the oldest, handicrafts in the world, namely, the potter's wheel. English manufacturers

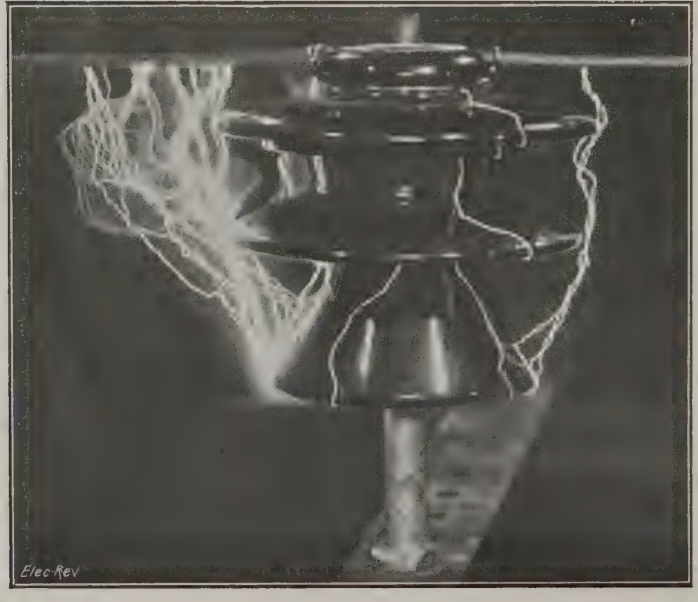

Fig. 18.—A 66-kV Pin-type Insulator Flashing Dry at 165 kV.

Fig. 21.—A 300-kV Dry Flash-over.

In conclusion, reference may be made to the works power supply. Steam being a necessity in the process

maintain that insulators made by this process are, without doubt, superior to the cheaper pattern, which is not "thrown" on the potter's wheel. The "thrower" uses no tools in making the insulator, he simply spins and forms the article entirely with his hands as he sits over his wheel, which manipulation is identical with that practised 50 centuries ago.

These facts, however, by no means imply that a long-established concern must necessarily be old-fashioned in its methods, for apart from the great improvements that have been made in the process work, labour-saving devices and machinery have been introduced with considerable advantage from the point of view of both workmanship and cost reduction.

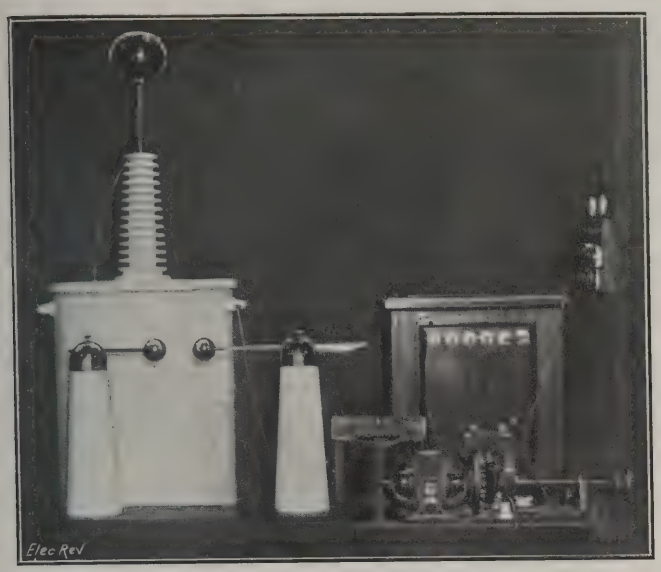

Fig. 22.—High-frequency Testing Outfit.

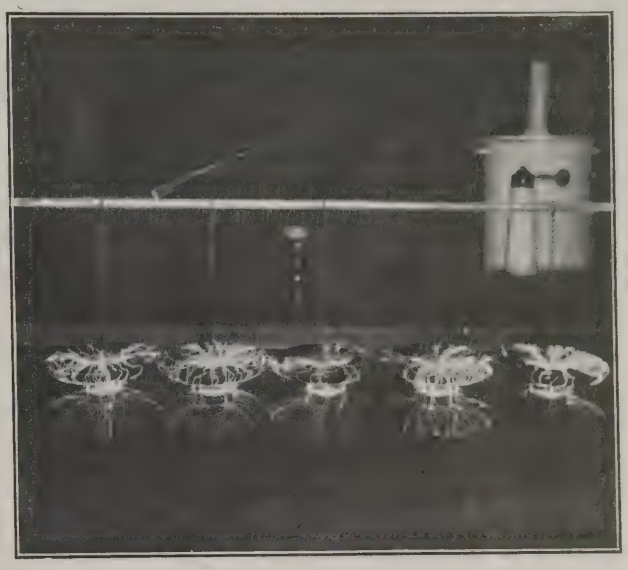

Fig. 23.—High-frequency Test at 80 kV.

We are indebted to the directors for the loan of some of the photographs reproduced in this article, and for the facilities placed at our disposal on the occasion of our visit to their factories.

The Flood-Lighting of Niagara Falls.

A particularly interesting and successful illumination scheme has recently been carried out at the waterfalls of Niagara. The project provides batteries of searchlights, placed in towers erected at the rear of the falls, which are arranged so as to flood-light the waters, resulting in the wonderful spectacular illumination illustrated in fig. 1.

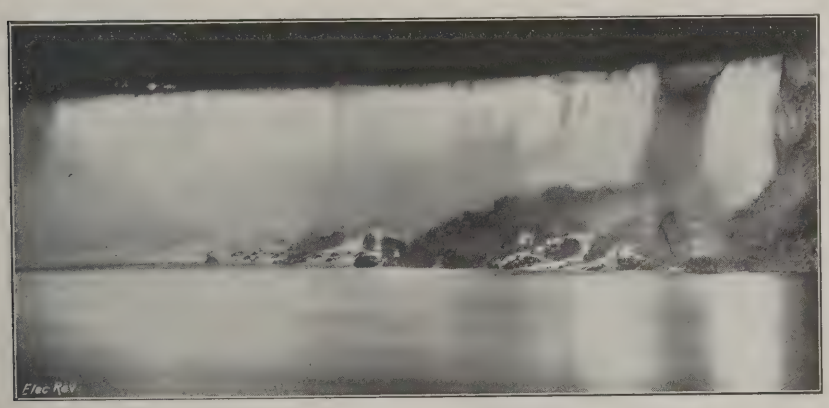

Fig. 1.—Niagara Falls, Illuminated.

Fig. 2 shows one of the batteries, which consists of 24 36-in. medium-intensity searchlights. The lamps are of the horizontal d.c. arc type, and are equipped with silvered glass mirrors. Each has a single feed and an automatic magnetic control. The lamp working pressure is 45 volts, when the loading is 20 A. The lights are focused by means of a single lever and handle, the manipulating gear extending below the base of the searchlight. The rheostat is built up of resistance tubes, and is provided with an 8-way switch for adjusting the current taken by the lamp. The illumination in beam candle-power immediately in front of each light is 4,500,000 c.p. This should be distinguished from the measurement of open-arc illumination. The beam candle-power takes into account the character of the reflecting mirror, and the brilliancy of the crater in the positive carbon, as well as the quality of the glass in the front door, and is a direct measure of the effective illumination provided by the searchlight. It will be recalled that it was arranged when the scheme was first authorised that the Government, U.S.A., should pay one-third of the cost, $60,000, of installing the plant and maintaining it for the first year, the remainder to be borne by Niagara Falls, New York and Ontario, and the Government of Ontario.

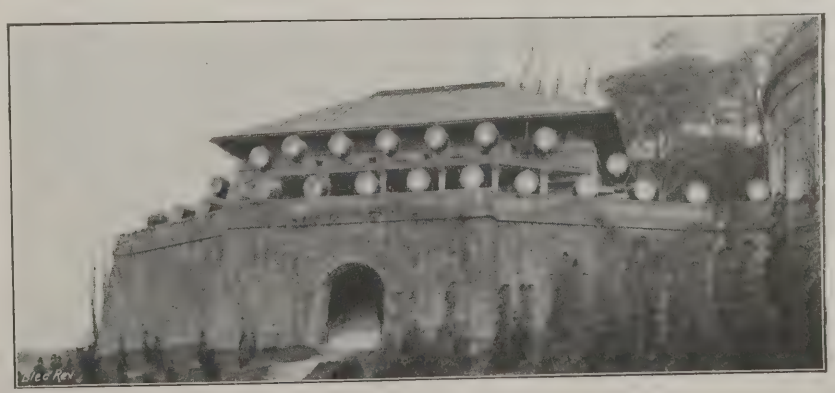

Fig. 2.—Searchlight Battery.

Remote-Control Sub-Stations.

The New Tramway Sub-Stations at Croydon.

What are claimed to be the first two remote-control sub-stations to be used on tramway traction in this country have recently been put into commission at Croydon, one at Thornton Heath and the other at South Croydon, in connection with the through running of the L.C.C. tramcars to Croydon. The two installations are practically identical, both in equipment and operation, and it will be sufficient to describe only the one at Thornton Heath. A 3-phase, 50-cycle, 6,000/6,600-V supply is received from the Croydon generating station at Factory Lane, from where the sub-station is controlled, and is converted to d.c. at 560/575 volts, which is fed to a section of the tramway overhead system. The main equipment consists of the incoming e.h.p. switchgear, fig. 1, made by Messrs. Reyrolle, a British Electric transformer, a 500-kW, 600-V rotary converter of Messrs. Mather & Platt's manufacture, the necessary starting and regulating panel, which is equipped for the Shuttleworth-Thomas system of remote control, supplied by Messrs. Bertram Thomas, and a d.c. switchboard with Bertram-Thomas switchgear. In addition, a control panel is provided at the operating station. The Shuttleworth-Thomas remote-control system, which was originated by Mr. Shuttleworth, of the Hull electricity undertaking, employs a small number of pilot wires between the control and sub-stations. At the start the operator, by placing the controller handle in position, sends a small d.c. out from the generating station. It is received by a small motor situated at the foot of the starting panel, fig. 2, which, in a series of operations performed by a crank and connecting rod to which it is geared, operates the remote-control equipment. A 3-pole switch, short-circuiting the starting pony-motor, is first thrown into the open position, while the field rheostat of the converter, placed above the starting panel, is set to its starting position. A small multiple change-over switch is then operated and diverts the controlling energy to a motor on the e.h.p. switch panel. This closes the switch, and the supply, through the transformer, is connected to the pony motor. This is directly coupled to the converter, and

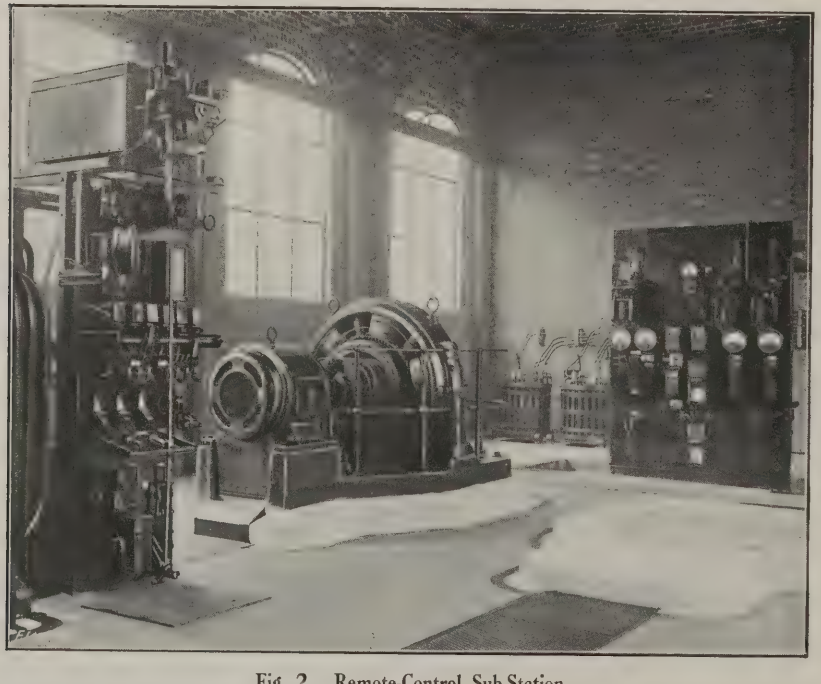

Fig. 2.—Remote-Control Sub-Station.

the machine starts and runs up to speed. The converter is self-synchronising by virtue of the very high starting torque of the motor and the reduction of the slip to a particularly low figure, which at the same time considerably increases the synchronising torque. The pony motor has a double winding and the same number of poles as the converter. The latter pulls quickly and quietly into step and remains steady until the normal operating pressure is reached, when the start-

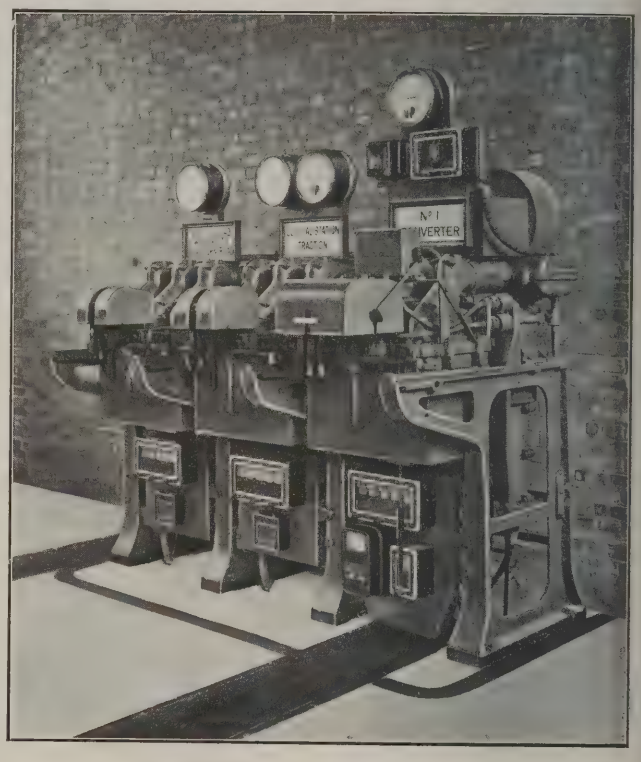

Fig. 1.—E.h.p. Switchgear.

ing motor is cut out of circuit. The last operation is effected by the small motor on the control panel, to which the operating current is re-diverted after the operation of the e.h.p. switch. It now closes the machine switch, and the converter is ready for load. The multiple switch is again operated, this time diverting the pilot wires from the control panel to the d.c. side of the machine, and all further operations are controlled by the machine's own energy. The voltage regulation is effected by a system of relays at the top of the control panel. The relays are operated by the engineer at the main station by "tapping" a relay switch, each tap moving the rheostat one notch forward or backward as the case might be. When the pressure is correct the machine circuit breakers on the d.c. board are operated from the main station, and the machine is put on load. The d.c. switches can be operated from the main station, independently of the a.c. equipment, and the whole sub-station can be shut down immediately at any time. The installation was subjected to an interesting and somewhat drastic test on completion. A heavy feeder was run direct to the trolley wire just outside the station, and this was "shorted" to the rails; the machine stood the test and did not flash-over.

In conclusion, we are indebted to Mr. A. C. Cramb, M.I.E.E., for permission to inspect the installation, and to Mr. Eustace Thomas, of Messrs. Bertram Thomas, Ltd., for his assistance in the preparation of the above notes.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Argentina.—BUENOS AIRES.—April 12th. Public Works Department. Rock drilling installation, including steam shovel, aerial transporters, 170-h.p. electric generating plant, &c.*
May 3rd. Electric travelling crane, capacity 1½ metric tons.*
Department of Sanitary Works. May 26th. Two 1,000-kW Diesel-engine generating sets.*
May 27th. Electrically-driven centrifugal sewage pumps.*

Australia.—BRISBANE.—August 27th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator and two water-tube boilers, with economisers, draught plant, &c. Specifications (£5 5s.) from the offices of the company, Boundary Street, Brisbane.
MELBOURNE.—May 11th. P.M.G.'s Department. Telephone jacks.*

Barking.—April 20th. County of London Electric Supply Co., Ltd. Circulating-water pumps and pump-house equipment, circulating-water screening plant, and boiler-house and coal-handling plant. (See this issue.)

Barnes.—Electricity Department. E.h.p. and l.p. cables. (See this issue.)

Basingstoke.—April 6th. Electricity Department. One 600-b.h.p. heavy-oil engine and direct-coupled dynamo. (See this issue.)

Belfast.—April 3rd. Electricity Department. One 1,000-kW rotary converter, with transformer, l.p., a.c. switchgear, &c. (March 12th.)

Brazil.—RIO GRANDE DO SUL.—April 15th. Port and Bar Management. 10 electrically-operated portal cranes, capacity 2,500 kilos; 2 ditto, 5,000 kilos capacity; and 7 electric winches or capstans.*

Brentford.—March 30th. Board of Guardians. Wiring, &c., at the Institution, Warkworth House, Isleworth. (See this issue.)

Cardiff.—March 22nd. Electricity Department. Grit-collecting plant, 100-kW, 400-V alternator, &c. (March 5th.)

Colwyn Bay and Colwyn.—April 8th. Electricity Department. Stores for 12 months, including cables, joint boxes, cut-outs, house-service meters, &c. (See this issue.)

Edinburgh.—April 12th. Electricity Department. Four water-tube boilers, economisers, and mechanical stokers or alternatively, boilers, economisers, air heaters, and mechanical stokers, or boilers, economisers and powdered fuel plant. (March 12th.)

Egypt.—CAIRO.—April 27th. Egyptian Government. 1,100 desk telephones. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, Westminster, S.W.1.

Erith.—March 27th. Electricity Department. 1,000 yd. (approx.) h.p. 3-core cable. (See this issue.)

Grimsby.—March 29th. Electricity Department. One 2,000-kW converter, one 1,000-kW ditto, l.p. switchgear, cable work, &c. (March 5th.)

Hallaton, Market Harborough.—Wiring and installation of electric lighting plant at Village Hall. (See this issue.)

Hazel Grove, near Stockport.—April 13th. Hazel Grove and Bramhall U.D.C. 2,300 yd. armoured cable. (See this issue.)

India.—March 30th. India Store Department. Complete equipment for one rotary-converter sub-station, three separate rotary-converter sets and track sectioning switchgear for the G.I.P. Railway electrification. (February 26th.)
March 24th. 30-line automatic and 10-line manual telephone equipment. (March 12th.)
April 19th. Goods lift for the Imperial Record Offices at Raisina, Delhi. (A.X .2,904.)*
April 2nd. Cable. (March 5th.)
April 23rd. Electrical equipment for 15 motor coaches and 42 trailer coaches. (March 5th.)
April 13th. 23 electric passenger locomotives. (February 26th.)
May 7th. 15 motor-coach underframes and bodies, 30 motor bogie trucks. (March 12th.)

Kettering.—March 23rd. Electricity Department. Transformers, e.h.p. and l.p. switchgear, one 1,500-kW rotary-converter equipment, and one steam turbo-boiler feed pump. (February 26th.)

Leyton.—April 9th. Education Committee. Installation of electric lighting and central heating at the Sybourn Street new school. (March 12th.)

London.—LONDON COUNTY COUNCIL.—March 23rd. Wiring and fittings for electric lighting at St. Paul's Road elementary school, Bow, E. (March 5th.)
METROPOLITAN ASYLUMS BOARD.—March 24th. Installation of electric lighting at the Southern (Lower) Hospital, Dartford. (March 5th.)
ISLINGTON.—March 29th. Borough Council. Two 3¼-ton electric refuse-collecting vehicles fitted with steel tipping bodies (March 12th.)

Luxembourg.—The municipal authorities of Luxembourg have invited tenders for the supply of 2,300 metres of 700-V armoured cables.

Manchester. — March 22nd. Electricity Department. 3-phase, 420-V sub-station switchgear, 3-phase, 6,600-V and 11,000-V ditto, three 500-kVA static transformers, and one 7,500-kVA forced-air-cooled transformer. (February 19th.)
March 22nd. One 5-ton electric tipping wagon and one 10-ton electric tractor with trailer. (February 26th.)
April 6th. 3-phase, 6,600-V sub-station switchgear. (March 12th.)
March 26th. One 10-ton hand-operated overhead travelling crane and gantry, Blackley sub-station. Form of tender from Mr. H. C. Lamb, manager, Electricity Department, Town Hall.
March 23rd. Tramways Committee. Copper bonds for tramway rails. Forms of tender from Mr. Henry Mattinson, general manager and chief engineer, Corporation Tramways, 55, Piccadilly.
PROVINCE OF EAST LANCASHIRE.—Wiring, &c., Masonic Temple, Manchester. (March 12th.)

Mountain Ash.—March 22nd. Electricity Department. Two 500-kVA transformers. (March 5th.)

New Zealand.—June 21st. Auckland Electric Power Board. L.p. insulators, &c.*

Otley.—March 30th. Wharfedale Isolation Hospital Committee. Electrical installation at the Isolation Hospital, Menston. (March 5th.)

Pentre, Rhondda.—March 27th. Rhondda U.D.C. Electricity Department. 12 months' supply of house-service a.c. ordinary and prepayment meters, cable, joint boxes, compound, cut-outs, &c. (March 5th.)

South Africa.—JOHANNESBURG.—April 12th. S.A. Railways and Harbours. Electrification of Cape Town Suburban Railway. Supply and erection of the overhead equipment of the permanent way and overhead transmission and distribution lines. (February 12th.)
May 6th. Two electric goods lifts.*

Stirling.—March 26th. Corporation. Electrical work at 38 houses. Specifications from Burgh Surveyor.

Sutton Coldfield.—March 24th. Electricity Department. E.h.p. underground mains, distributors, feeder pillars, and network fuse boxes. (March 5th.)

Walthamstow.—March 24th. Electricity Department. 12 months' supply of l.p. cables and v.i.r. wires. (March 12th.)
April 13th. Electricity Department. Steel overhead bunkers and boiler-house buildings; and coal- and ash-conveying plant. (March 12th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Andover.—Town Council. Accepted:—
Installation of electric pumping plant at the sewage pumping station.—Edwards & Armstrong, Ltd.

Australia.—Sydney City Council has decided to accept the Cockatoo Dockyard's tender of £666,000 for the construction of power-house plant on Cockatoo Island.—*Reuter* (Sydney).

Aylesbury.—Town Council. Accepted:—
H.p. transmission lines and services for the extended area of supply (£37,822).—Craven and District Electrical Construction Co., Ltd.

Bradford.—Baths Committee.
Installation of electric lighting apparatus at Lapage Street school baths.—F. Draycott.

Tramways Committee.
32½ tons of hand-brake shoes (£325); 45 tons of track-brake blocks (£446).—Cole, Marchent & Morley, Ltd.
6 miles of 4/0 round copper trolley wire (£584).—F. Smith & Co., Ltd.

Cardiff.—At a meeting of the City Council last week, the recommendation of the Electricity Committee to accept a Belgian tender for low-pressure cables was referred back.

Darlington.—Town Council. Accepted:—
Four additional trolley 'buses (£6,312).—Clough, Smith & Co.

East Ham.—Electricity Committee. Accepted:—
1,000-kW motor-converter (£4,044).—Bruce Peebles & Co., Ltd.
Switchgear (£173).—A. Reyrolle & Co., Ltd.

London.—WANDSWORTH.—L.C.C. Education Committee. Recommended:—
Electrical installation at Technical Institute:

F. G. Minton, Ltd. (Recommended.)	**£1,573**
Pinching & Walton	1,721
Malcolm & Allen, Ltd.	1,730
H. J. Cash & Co., Ltd.	1,752

The chief engineer's comparable estimate is £1,620.

CAMBERWELL.—Works Committee. Recommended:—
Maintenance of electric lighting, heating and power installations, &c., at public buildings.—Commercial Telephone & Electric Co., Ltd.

St. Pancras.—Electricity Committee. Switchgear for Grafton Road sub-station :—

British Thomson-Houston Co., Ltd. (Recommended.) ...	**£2,826**
English Electric Co, Ltd.	2,826
Metropolitan-Vickers Electrical Co., Ltd	3,008
Ditto (alternative)	3,166
Ferguson, Pailin, Ltd.	3,019
Reyrolle & Co.	3,050
Switchgear & Cowans, Ltd.	3,050
B. Thomas	3,050
General Electric Co., Ltd.	3,075
Whipp & Bourne, Ltd.	3,271
Johnson & Phillips, Ltd.	3,275
Park Royal Engineering Co., Ltd.	3,320
Ditto (alternative)	3,150
New Switchgear Construction Co., Ltd.	3,398

Shoreditch.—Electricity Committee. Accepted :—

Cable (£919).—W. T. Glover & Co., Ltd.

St. Marylebone.—Electricity Supply Committee. Recommended :—

Avery one-ton automatic hopper weigher (£904).—Babcock & Wilcox, Ltd.
Duplicate synchronising equipment (£78); earth resistance for e.h.p. supply (£198).—Ferguson, Pailin, Ltd.
Spare grab for the coal crane (£206).—W. Goodacre & Sons.

Ferrybridge (Yorks.).—Yorkshire Electric Power Co., Ltd. Accepted :—

Corrugated copper expansion pieces required in connection with the circulating water piping at the New Ferrybridge power station (£873).—Empress Coppersmiths & Engineers, Ltd.

Portsmouth.—Electric Lighting Committee. Accepted:

Steel-frame turbine house at the generating station, Gunwharf Road (£7,174).—Tanner Bros.
Electric travelling 60-ton crane (£2,442).—Royce, Ltd.

Preston.—Electricity Committee. Accepted:—

Supply and erection of towers and overhead transmission line (£38,456).—Callender's Cable & Construction Co., Ltd.

Swansea.—Health Committee. Accepted:—

Re-wiring Corporation stables (£72).—W. H. Norman Kirk.

Weymouth.—Electricity Committee. Accepted:—

Distributor cable (£212).—Johnson & Phillips, Ltd.
Two boilers of 20,000 lb. capacity each (£16,350); two 1,500-kW turbines and alternators (£13,520); two condensing plants (£3,866); two 500-kW rotary converters, with switchgear, &c. (£6,495); circulating system (£230).—English Electric Co., Ltd.

Forthcoming Events.

Institution of Engineering Inspection.—Friday, March 19th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Paper on "Lubricating and Allied Oils," by Mr. E. A. Evans.

British Electrical Development Association.—Friday, March 19th. At the Hotel Cecil, Strand, W.C. At 7 for 7.30 p.m. Annual dinner.

Manchester Electro-Harmonic Society.—Friday, March 19th. At the Albion Hotel, Piccadilly, Manchester. Monthly concert.

City & Guilds of London, Central & Finsbury Engineering Colleges Old Students' Associations (Northern Section).—Friday, March 19th. At the Engineers' Club, Manchester. Annual dinner.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, March 20th. At the South Wales Institute of Engineers, Park Place, Cardiff. At 6 p.m. Discussion on "The Control and Distribution of Electricity in Mines," by Mr. I. Jones.

Willesden Polytechnic Electrical Engineering Society.—Saturday, March 20th. At Reggiori's Restaurant, Chapel Street, Edgware Road, W. At 6.30 p.m. Annual dinner.

Electrical Trades Commercial Travellers' Association.—Saturday, March 20th. At the Manchester Hotel, Aldersgate Street, E.C. At 7.30 p.m. Grand carnival dance.

Electrical Power Engineers' Association (London Western Section).—Saturday, March 20th. At Stewart's Restaurant, Victoria Street, S.W. At 7 p.m. Annual dinner.

(Kent Section).—Saturday, March 20th. At Hollingworth Hall Church Institute, Maidstone. At 6 p.m. Lecture on the "Brush-Ljungström Steam Turbine," by Mr. J. R. Hutchings.

Royal Society of Arts.—Monday, March 22nd. At John Street, Adelphi, W.C. At 8 p.m. Cantor Lecture on "Thermometry," by Mr. W. F. Higgins (Lecture II).

Institution of Electrical Engineers.—Informal Meeting.—Monday, March 22nd. At the Institution, Victoria Embankment, W.C. At 7 p.m. Discussion on "Performance of Mercury Arc Rectifiers," to be opened by Mr. G. Rogers.

(North-Eastern Centre).—Monday, March 22nd. At the Armstrong College, Newcastle-on-Tyne. At 7 p.m. Paper on "Developments in High-power Fuses," by Mr. L. C. Grant.

(North Midland Centre).—Tuesday, March 23rd. At the Yorkshire Cinema Exchange, Queen's Arcade, Leeds. At 7 p.m. Paper, "Some Notes on the Installation of a Modern Power Unit," by Mr. J. W. J. Townley.

(East Midland Sub-Centre).—Tuesday, March 23rd. At the University College, Nottingham. At 6.45 p.m. Paper on "Power Factor," by Messrs. C. C. Sutton and J. H. R. Nixon.

(North-Western Students' Section).—Tuesday, March 23rd. At Milton Hall, Deansgate, Manchester. At 7.30 p.m. Ordinary meeting.

Royal Institution.—Tuesday, March 23rd. At 21, Albemarle Street, W.1. At 5.15 p.m. Lecture on "The Growth of Crystals," by Prof. C. H. Desch.
Friday, March 26th. At 9 p.m. Lecture on "The Radiation from Atomic Nuclei," by Sir Ernest Rutherford.
Saturday, March 27th. At 3 p.m. Lecture on "The Rare Gases of the Atmosphere," by Sir Ernest Rutherford.

Radio Society of Great Britain.—Wednesday, March 24th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 6 p.m. Lecture on "Fading," by Prof. E. W. Marchant.

Institution of Production Engineers.—Wednesday, March 24th. At 83, Pall Mall, S.W. At 7.30 p.m. Paper on "Works System," by Mr. J. T. Konworthy.

Institution of Welding Engineers.—Thursday, March 25th. At Caxton Hall, S.W. At 8 p.m. Paper on "Electric Welded Construction," by Mr. J. Caldwell.

British Electrical Development Association Conference.—Friday, March 26th. At Caxton Hall, Westminster, S.W. At 9.30 p.m. Paper on "Progress and Prospects of Commercial Electric Cookery," by Mr. J. J. McKenna.

Birmingham Electric Club.—Friday, March 26th. At the Grand Hotel, Birmingham. At 7 p.m. Lecture on "Telephone Repeaters."

Physical Society of London.—Friday, March 26th. At the Imperial College of Science, South Kensington. At 5 p.m. Ordinary meeting.

National Association of Supervising Electricians.—Saturday, March 27th. At the Holborn Restaurant. Annual dinner.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

Excellite insulating board.
Fortifix quick drying cement.
Small galvanic machines operated by the insertion of a coin.
Omni-Volt electric irons.

Notes.

Smoke Abatement Recommendations.—In a topical talk on "The Smokeless Age" from the London station of the British Broadcasting Company on March 9th, Dr. J. S. Owens, M.D., A.M.Inst.C.E., hon. secretary of the Advisory Committee on Atmospheric Pollution, outlined the recommendations contained in the final report of Lord Newton's Smoke Abatement Committee, on which, he said, the Smoke Abatement Bill to be introduced into Parliament shortly by Mr. Neville Chamberlain, Minister of Health, might probably be constructed. The Committee suggested a general tightening up of all existing smoke-prevention laws, and the placing of a legal obligation on all manufacturers and users of engines or plant of any description to adopt the best practicable means of avoiding the pollution of the air by smoke; also certain changes in the administration of the law, under which smoke-makers would be punished by much heavier penalties than those in vogue at present. In dealing with domestic and kitchen smoke, it was recommended that every encouragement should be given to the cheapening of the supply of gas and electricity, while municipal authorities should not make profits out of their gas and electricity undertakings in order to relieve the rates. The Committee also proposed that the Central Housing Authority should decline to sanction any housing scheme unless the plans provided for the adoption of smokeless methods of heating and cooking.

Artificial Sunlight Exhibition.—An exhibition of artificial sunlight apparatus was held at the Middlesex Hospital, London, from March 11th to 16th, when an excellent display was seen. We are unable to deal with the matter in this issue owing to pressure upon our space.

Fatality.—While operating a coal-cutting machine at the No. 2 Pit, Hucknall, last week, a collier named Arthur Allsopp, was killed owing to the breaking of the connecting cable.

Late Legal.—Armorduct Cable Co., Ltd.—In the Chancery Division on March 16th, Mr. Justice Eve confirmed a reduction of capital of Armorduct Cable Co., Ltd., by cancelling 18s. on each ordinary £1 share and cancelling the deferred shares altogether. Mr. Gedge, for the company, explained that between £7,000 and £8,000 of the loss was upon trading.

The New Electricity Board.—Tuesday's edition of the *Financial Times* contains an article embodying the views of a leading municipal engineer in London, of Col. Morcom and Mr. D. N. Dunlop, of the B.E.A.M.A., and Mr. M. J. Railing, of the General Electric Co., Ltd., regarding the provisions contained in the Electricity Bill with reference to the constitution and authority of the proposed Central Electricity Board. In the main these all express dissatisfaction with the proposed constitution. A powerful industrial executive was expected from the speech delivered by Mr. Baldwin at Birmingham, whereas the idea conveyed in the Bill is that there will be what is tantamount to a second group of Electricity Commissioners under the domination of the existing Commission.

Speaking at the Royal Colonial Institute luncheon at the Cannon Street Hotel, London, on March 16th, when Mr. J. Sandeman Allen, M.P., presided over some 70 members and guests, Sir Philip Dawson, M.P., said the subject was of national importance, and he had given it much attention. The consumption of electricity per head of population in this country was between one-fifth and one-sixth of that in other countries; in London it was just half the Berlin figure. From a given size of station the output in Germany was twice what it was in this country. In England they suffered from an excess of inefficient stations, and what that meant was obvious from the coal consumption and heat efficiency figures. In most stations there was also an excess of spare plant; for instance, assuming the maximum demand to be 100,000 h.p., the station should contain 25,000-h.p. generating sets with two sets (or 15 per cent.) as spare plant; one set being available in case of breakdown, while the other was being overhauled. To-day, however, between 60 and 70 per cent. of the total plant installed in this country was spare. The remedy for that state of affairs was not new; it was in use in America and in Europe, and was the interconnection of the principal stations. Why was legislation necessary to carry such a scheme through? Simply because common-sense was the most uncommon sense, jealousy between undertakings preventing them from co-operating. Private undertakings, such as collieries and steel works, were prepared to supply their

excess power into the public network as was being done on the North-East Coast, where nearly a quarter of the total supply was furnished by waste heat. His recent investigation in Germany also showed that a great deal could be done with waste heat. There surplus blast-furnace and other gases were either converted into electricity or supplied direct as gas into the public mains. Water power would also be of assistance, and, although it might be surprising to some, there was quite a number of fair-sized water powers available in this country.

Regarding the criticism that transmission losses and transmission-line costs would be too heavy to make such a scheme worth while, it should be remembered that the saving in spare plant would more than pay for such lines, and at the voltages that were now being used (from 100,000 to 200,000 volts), the line conductors could be very small. Although he believed that an Electricity Bill was essential, it did not mean that power would be available to the general public at ½d. per kWh; that was impossible, except in the case of certain chemical works which carried on continuous processes. Nevertheless, a Bill would materially improve present conditions.

After quoting an article in a German newspaper to indicate the interest which our principal rivals were taking in the measure, he approved of the idea of the Bill, which he characterised as sound, both technically and economically. He had the greatest admiration for the Electricity Commissioners, and was certain that they had the interest of the industry at heart, but the consumer and prospective consumer should be considered before the producer and manufacturer. Whilst it was desirable to preserve the freedom of private enterprise, the supply of electricity was a public utility service and, as such, must be under public control. The only criticism he had to offer was in that connection: The present intention was to make the National Central Board the servant of the Commissioners; that was totally wrong. The Commissioners should be no more than advisers to the Board, and unless the Board were composed of business men, totally independent of all political influence, it might do harm. If any appeal against the decision of the Board were necessary (and he thought there would be very few appeals) it should be to Cæsar—in this case the House of Commons.

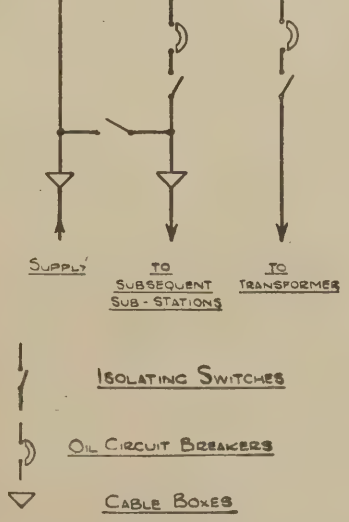
E.A.W. Activities.—A meeting is to be held in the Lord Mayor's Parlour, Town Hall, Manchester, on March 25th, at 3.15 p.m., to inaugurate the Manchester District Branch of the Electrical Association for Women. Tea will be provided at 4 p.m., by the courtesy of the Manchester Corporation Electricity Department. The work of the branch will be outlined by the director, and the local officers and Council will be formally elected at the meeting. Miss G. L. Entwisle, A.M.I.E.E., is acting as hon. secretary. Lady Brooks, Mr. R. A. Chattock, and the Director will address a public meeting under the auspices of the Birmingham branch on March 29th, in the Council Chamber, Birmingham.

Association of Special Libraries and Information Bureaux.—A business meeting at which it is proposed formally to inaugurate the Association of Special Libraries and Information Bureaux will be held at the Institution of Mechanical Engineers, Storey's Gate, London, at 2.30 p.m. on Monday, March 29th, 1926. All who are interested are invited to attend. The Association is being formed to facilitate the coordination and systematic use of sources of information in science, industry, commerce, and public affairs generally; when fully developed it will function as a clearing house for those wishing to get into touch with specialised knowledge. The Association's first activity is to be the compilation of a Directory of Special Libraries and Information Bureaux in the British Isles. The Carnegie United Kingdom Trustees, in addition to setting aside the sum of £1,500 to assist the Association in the first two years of its work, have generously undertaken to defray the cost of compiling the Directory. Those willing to collaborate with the Association in building up the Directory are asked to communicate with the organising secretary (38, Bloomsbury Square, W.C.1), from whom further information may be obtained.

Liverpool Engineering Society.—It is interesting to note that this Society attained its jubilee in November of last year, having been founded by six pupils of Mr. G. F. Lyster, engineer-in-chief to the Mersey Docks and Harbour Board, in November, 1875. In a paper read on March 3rd, Mr. W. E. Mills reviewed the history of the Society from its commencement; the author himself has been associated with it for 46 years, and was president in 1885. Many distinguished engineers have occupied the presidential chair or have been members of the Society, which last year had a roll of 866 members.

International Congress of Engineers' Councils.—The third International Congress of Engineers' Councils will meet at Warsaw on May 13th.—*Reuter* (Warsaw).

Research in France.—At the last meeting of the French Union des Syndicats de l'Electricité it was reported that the Wire and Cable Committee was engaged on a consideration of the question of tension and bending tests for rubber-insulated cable. The Transformer-Oil Committee has also drawn up a draft scheme of the research work to be entrusted to the Ecole Supérieure du Petrole, in Paris, which, thanks to subscriptions which have been received, can be put in hand at once.



A series of new regulations for the installation, starting, and dismantling of transformers has lately been drawn up by the French Chambre Syndicate des Constructeurs de Gros Matériel Electrique.

A Peculiar Explosion of an Electric Boiler.—Some time ago a case occurred in Canada of an electric boiler exploding, wrecking the house in which it was installed. Difficulty was experienced in tracing the cause of the explosion, but as the result of investigations carried out by Prof. J. W. Shipley and Mr. A. Blackie it has been established that gases of an inflammable and explosive nature can be generated electrolytically in electric water heaters, and the explosion was probably due to this cause. The experiments carried out established without doubt (according to the Canadian *Electrical News*, which publishes a description of the tests) that single-phase, 60-cycle alternating current at either 110 or 220 V will generate gases in aqueous electrolytes, and that these gases are generally of an explosive nature. One typical analysis gave the following results:—Carbon dioxide 10.4 per cent.; oxygen 1.4 per cent.; hydrogen 49.8 per cent.; and nitrogen 38.4 per cent. This mixture was found to be inflammable, and when mixed with 70 per cent. of air was explosive. It is apparent from the composition of the gases generated that their nature depends upon the composition of the electrodes used in the experiments. The metals evolved very little, if any, hydrocarbon gases, while the carbon electrodes gave a considerable percentage of these gases. It was found that the rate of evolution of gas depended upon the spacing of the electrodes, the relation of the electrodes to the shell, the current flowing, the temperature of the electrolyte, and the depth of immersion of the electrodes. The composition of the gas was also found to be a function of the manner of operation of the system; that is, the surge between the electrode chamber, the radiating system and the expansion tank.

In suggesting means for safeguarding against explosions of gases in electric boilers, the investigators consider that it is risky to rely upon the automatic venting of the chamber gases, and all installations of such water heaters should be provided with a water-gauge glass whereby the accumulation of gases retained within the electrode chamber could easily be detected.

A New Element.—It has been announced by the University of Illinois that Dr. B. S. Hopkins, Professor of Inorganic Chemistry, claims, with his assistants, to have isolated from rare earths one of the five elements whose places in the scale of atomic numbers have not, up to the present, been filled. Its place is the 61st in the scale, says *The Times*, the discovery being the result of more than five years of research with special X-ray apparatus.

Simple Sub-station Protection. — The accompanying illustration shows the arrangement of the high-pressure system in each of the sub-stations of the Morecambe Corporation which deal with a 6,600-V, 3-phase bulk supply from the Lancaster Corporation. It will be noticed that the high-

Method of Sub-station Protection.

pressure incoming feeder to each sub-station is taken to the bus-bars merely through a set of isolating switches, the protection for this feeder being at the outgoing end of the previous sub-station. An arrangement of links is provided so that the whole of the high-pressure gear in each sub-station can be isolated for cleaning purposes. The supply is maintained by closing a set of isolating switches which short-circuit the sub-station, as shown on the diagram. The sub-station equipments were supplied by the General Electric Co., Ltd.

The British Association.—The 1927 meeting is to be held at Leeds, and Sir Arthur Keith, Hunterian Professor in the Royal College of Surgeons, is being nominated for the presidency.

An All-Electric Hotel Kitchen.—An interesting all-electric domestic installation, representing 100 kW of total connected load, is to be found at the Greyhound Hotel, High Street, Croydon, where the kitchen has recently been equipped entirely with electrical cooking apparatus. The installation consists of a 24-kW boiling table, made up of twelve double-section plates of equal loadings; one medium-size boiling table of 16-kW loading, comprising eight 2-kW plates; one large double-oven roasting range of 10-kW loading for each oven; and a fish fryer. The last-mentioned apparatus has two pans, each of 6-9-kW capacity. Two bains-marie, of 6.5-kW loading each, are also installed, and a two-compartment, 7.2-kW grill and a ten-gallon, 6-kW stock pot complete the installation. Although it is at present too early to obtain any useful consumption figures, we understand that the hotel

An All-Electric Hotel Kitchen.

management is well satisfied with the results obtained so far. The following figures give the approximate number of meals dealt with weekly by the equipment at present, but these by no means represent the full capacity of the apparatus:—Luncheons and suppers, from 1,000 to 1,500; dinners, from 500 to 700; and staff meals from 500 to 700. The whole of the apparatus was supplied by the Jackson Electric Stove Co., Ltd.

Institution Notes.

Institution of Electrical Engineers.—Informal Meeting.—At the informal meeting on Monday, March 8th, Mr. M. Whitgift was in the chair, when Mr. F. Creedy opened a discussion on "A Recent Development in A.C. Apparatus." The title of the paper did not convey the full significance of the subject, for Mr. Creedy for the first time made public a new type of rotary converter that he has designed, which may have quite notable results. He called it a "Binary Converter" because it combined the two principles of d.c. and induction in one machine. It consists of a stator with a shunt winding and an a.c. basket winding. The armature tapped at three equidistant points forms a short-circuited wound rotor which is rotated by the a.c. winding operating in a d.c. field. The rotor has a commutator and delivers direct current. The ingenious design eliminates induction in the d.c. field coils by having the length of the a.c. pole pitch double that of the d.c. The machine has only been made in small sizes at present, but for the range of ½ kW to 5 kW remarkably good efficiency is claimed. It has been installed for lift work, and it may be made with the drooping characteristic of welding generators. It may be connected without a transformer to any voltage up to 6,000 V to deliver d.c. at any voltage possible to the commutator. A lively discussion followed.

Students' Lecture.—A lecture and demonstration on "The Art of Illumination" is to be held at the Lighting Service Bureau, Electric Lamp Manufacturers' Association, 15, Savoy Street, W.C.2, for Student members of the I.E.E., on April 28th, at 7 p.m. The demonstration will be preceded by a free tea at 6.30 p.m., and each member may invite one friend. Early application for tickets should be made to Mr. J. W. Moffatt, hon. assistant secretary, 21, Lanier Road, Lewisham, S.E.13.

Institution of Civil Engineers.—Annual Dinner.—At the annual dinner of the Institution on March 10th, the Prince of Wales was the principal guest, and proposed the toast of "The Institution," of which he is an honorary member. In the course of his remarks, the Prince referred to the great achievements of British engineers which he had seen in all parts of the world, and recalled the occasion, three years ago, when he opened the capital power station at Rotherham. This station was named after him, and has maintained a high record for efficiency.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Mr. Charles Whillis, M.I.E.E., who for the last five years has been in charge of the Technical Section of the Northern District Superintending Engineer's office and was formerly in charge of the Newcastle South and Carlisle Sections, left Newcastle on March 10th to take charge of an important branch of the Engineer-in-Chief's Office, G.P.O., London. Mr. Whillis's departure took place at short notice, but a large number of members of the staff of the Northern District Engineering Department met in the superintending engineer's office to bid him good-bye and to present him with a bureau of the Chippendale period. The chair was taken by Mr. J. R. M. Elliott, M.I.E.E., superintending engineer of the Northern District. Mr. Elliott recalled the changes which had taken place since Mr. Whillis entered the P.O. service over 30 years ago. Messrs. Baldwin, Andrews, Motyer and Cook expressed the congratulations of the staff. Mr. Baldwin called attention to the fact that Mr Whillis was the second officer from the Northern District who, within the last three months, had been called to take up an important position on the headquarters' staff.

The St. Pancras Electricity Committee recommends granting three months' leave of absence to Mr. Baynes, the chief electrical engineer, upon medical advice.

M. Jan Sramek has recently been appointed the Minister of Posts and Telegraphs for Czecho-Slovakia in place of Dr. E. Franke, who has resigned.

Mr. W. T. Hodgson, electrical engineer, Horsell, has been elected a member of the Woking Urban Council.

The Derby Town Council has increased the salary of its electrical engineer, Mr. T. P. Wilmshurst, from £1,250 to £1,400 per annum.

In view of the growth of the undertaking, the Douglas (Isle of Man) Corporation Electricity Committee recommends increasing the salary of Mr. Bertram Kelly, the electrical engineer, from £500 to £550.

Mr. J. Conrad Fuller, A.M.I.E.E., of the Posts and Telegraphs Departments of the Federated Malay States, has arrived in London on long leave. He is staying at the Engineers' Club, Coventry Street, W.1.

Mr. J. W. Longley, a consulting civil and electrical engineer and chairman of the Bradford Corporation Electricity Committee, was on March 8th unanimously elected to the aldermanic bench to fill a vacancy created by a recent resignation.

Senatore Marconi is reported to be making a good recovery from an operation for internal trouble which he underwent in a London nursing home last week.

Mr. William Hainsworth, commercial assistant in the Stoke-on-Trent Electricity Department, who is leaving to take up a similar position with the Croydon Municipal Electricity Department, has been presented by his colleagues with a silver cigarette case.

Mr. Joseph A. Forde, electrical engineer, has been re-elected, unopposed, a member of the Broadstairs Urban Council.

St. Marylebone Electricity Supply Committee recommends that the salary of Mr. C. H. Smyth (chief electrical engineer), be increased from £1,500 (inclusive) to £1,700 (inclusive) per annum; that the salary of Mr. F. B. Leonard (chief assistant engineer) be increased from £900 (inclusive) to £1,000 (inclusive) per annum; and that the salary of Mr. F. Selley (mains and sales engineer) be increased from £750 (inclusive) to £850 (inclusive) per annum, all as from April 1st, 1926.

Mr. A. Baxendale, depôt superintendent, Rawtenstall Corporation Tramways and Motor Bus Department, has been appointed rolling stock and works superintendent to the Wallasey Corporation Tramways. Mr. Baxendale has been eight years at Rawtenstall, and previous to this, was at Bolton Corporation Tramways.

Obituary.—Mr. W. R. Cooper.—It is with feelings of very deep regret that we learn of the death, which occurred on Monday last at his residence in Tulse Hill, of Mr. William Ranson Cooper, M.A., B.Sc., M.I.E.E., A.M.Inst.C.E., consulting electrical engineer and electrochemist, of Westminster. Mr. Cooper was under the late Prof. W. E. Ayrton at the Central Technical College for three years, after which he was at the Richmond electric supply station. Later he was with Messrs. Latimer Clark, Muirhead & Co., and after a year in the Chemical Department at King's College he joined the staff of Mr. James Swinburne, subsequently becoming a partner in the firm of Swinburne, Cooper & Baillie, consulting engineers. For thirteen years he was editor of the *Electrician*. He was also editor for three years of *Science Abstracts*. Mr. Cooper had served on the Council of the Institution of Electrical Engineers, was a vice-president of the Faraday Society, honorary treasurer of the Physical Society, a member of the Electro-Culture Committee of the Board of Agriculture, and of the Conjoint Board of Scientific Societies. He was the author of numerous books, papers, and contributions to the Press, and was regarded as an authority on the subject of primary cells If we may pay a personal tribute it shall be that we invariably found him a most courteous and amiable colleague. He had been in failing health for some time past, and the end came somewhat suddenly after a seizure. He was 58 years of age.

New Companies Registered.

Eirco, Ltd. (N.I.309).—Private company. Registered in Belfast on February 23rd. Capital, £5,000 in £1 shares. Objects:—To acquire the business of electrical engineers carried on by L. Scop, W. Coulson, and F. A. Newell as the "Electrical Installation and Repairing Co." The directors are:—L. Scop, A.M.I.E.E., 37, Gandore Avenue, Belfast, electrical engineer; W. Coulson, 595, Oldpark Road, Belfast, electrical engineer; F. A. Newell, B.Sc., Templepatrick, Co. Antrim, electrical engineer. Qualification, 100 shares. Registered office: 40, Berry Street, Belfast.

West Insulating Co., Ltd. (212,261).—Private company. Registered March 8th. Capital, £1,500 in £100 shares. Objects: To adopt an agreement between J. Borer and J. R. West, and to carry on the business of agents, brokers, importers and exporters, shippers and manufacturers of or dealers in electrical and mechanical materials, &c. The first directors are:—J. Borer, Bretonbac, Switzerland (president of the Fabrique Suisse d'Isolants, Bretonbac); J. R. West, 45, Brondesbury Villas, Kilburn, N.W.6. The directors for the time being of the Fabrique d'Isolants, Bretonbac, Switzerland, may appoint one director. Qualification (except such nominee), 500 shares. Secretary: E. G. Misani. Solicitors: Castle & Co., 31, Gracechurch Street, E.C.3. Registered office: 31, Gracechurch Street, E.C.3.

H. E. Messmer, Ltd. (212,287).—Private company. Registered March 10th. Capital, £1,000 in £1 shares. Objects: To carry on the business of manufacturers' agents, dealers in machinery, scientific and electrical apparatus and instruments, testing apparatus, electrical, power and lighting installations, metal, paper, wood, rubber, glass, textile goods, parts, fittings, &c. The first directors are:—H. E. Messmer, 18, Arthur Street, New Oxford Street, W.C.2, manufacturers' agent (permanent managing director); and Mrs. Alice Messmer, 18, Arthur Street, New Oxford Street, W.C.2. Qualification, 1 share. Solicitors: Dalston, Sons & Elliman, 21, Southampton Street, Bloomsbury, W.C.1. Registered office: 18, Arthur Street, New Oxford Street, W.C.2.

H. D. Douglas & Co., Ltd. (212,323).—Private company. Registered March 11th. Capital, £1,000 in £1 shares. Objects: To carry on business as electrical, mechanical and general engineers, manufacturers, importers and exporters of and dealers in machinery, machine tools, implements and electrical, mechanical and scientific apparatus and accessories, manufacturers of and dealers in electrical insulation fabrics and tapes, oiled silks, linens, cottons and other fabrics, rubber-proofed fabrics, &c. The subscribers (each with one share) are:—H. D. Douglas, 42, Bromley Road, Catford, S.E.6, engineer; and H. C. Rose, 67, Hervey Road, Blackheath, S.E.3, merchant. Solicitors: Frank Simmons & Carter, 98, Salisbury House, London Wall, E.C.2.

West Wales Electric, Ltd. (212,310).—Private company. Registered March 10th. Capital, £500 in £1 shares. Objects: To carry on the business of electrical, motor, gas, mechanical, wireless, structural, heating, lighting and general engineers and inventors, constructors and installers of transmission systems, garage proprietors, manufacturing opticians, makers of scientific instruments, &c. The subscribers (each with one share) are:—L. G. Walker, Carregfelen, Portmadoc, electrical engineer; J. N. More, Crown Lodge, Harlech, surveyor; and A. Stokes, Portmadoc, solicitor. L. G. Walker is the first permanent director. Qualification, £50. Remuneration, not more than £50 each per annum. Secretary: L. I. Morgan. Solicitors: Breese, Jones & Cassen, Portmadoc.

Peerless Electrical Manufacturing Co., Ltd. (212,353).—Private company. Registered March 12th. Capital, £10,000 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in electrical or mechanical or other kitchen and household equipment, food preparing machinery and labour-saving devices, including refrigerating and ice-making machines, ice cream freezers, potato peelers, mincing machines, cake and other food mixers, breaking, making and sausage machines, &c. The first directors are:—F. H. Wright, 1, Golders Green Crescent, N.W.11; and E. Shrubsole, 47a, Regent's Park Road, N.W.1. Qualification, 100 shares. Solicitors: T. V. Howells, 3, Rathbone Place, W.1. Registered office: 167 and 169, Great Portland Street, W.1.

Radioland, Ltd. (212,365).—Private company. Registered March 12th. Capital, £500 in £1 shares. Objects: To carry on the business of electricians, electrical and mechanical engineers, manufacturers of and dealers in apparatus, appliances and material relating to or used in connection with radio, or other telegraphy and telephony, gramophones and all kinds of talking machines, &c., to acquire the trade mark "Radiolys." The subscribers (each with one share) are:—E. S. M. Perowne, 7, Great James Street, Bedford Row, W.C., solicitor; F. G. Buckland, 49, Lavender Avenue, Mitcham, clerk; and G. F. Heard, 23, Harewood Road, Colliers Wood, S.W.19, managing clerk. The first directors are to be appointed by the subscribers. Solicitors: Perowne & Co., 7, Great James Street, W.C.1.

Barnes Brothers (Radiex), Ltd. (212,345).—Private company. Registered March 12th. Capital, £3,000 in £1 shares (1,500 10 per cent. preference and 1,500 ordinary). Objects: To acquire the business of scientific instrument manufacturers carried on by P. J. Barnes and F. S. Barnes, trading as Barnes Brothers, at Radiex House, Heygate Avenue, Southend-on-Sea, and to carry on this and the business of radio and general electrical and mechanical engineers, &c. The first directors are:—P. J. Barnes, 10, Beedell Avenue, Westcliff-on-Sea, Essex; and F. S. Barnes, "Trenholme," Thorpe Hall Avenue, Thorpe Bay. Qualification, 50 shares. Secretary: F. S. Barnes. Solicitor: H. B. Snow, 51, High Street, Southend-on-Sea. Registered office: "Radiex" House, Heygate Avenue, Southend-on-Sea, Essex.

Silgolum, Ltd. (212,335).—Private company. Registered March 11th. Capital, £500 in £1 shares. Objects: To acquire the trade mark "Silgolum," to adopt an agreement with R. Wellesley, and to carry on the business of electrical, hydraulic and mechanical engineers and contractors, producers and suppliers of electrical energy, manufacturers of machinery, &c. The first directors are:—C. R. Watson, 8, Sherwood Road, Wimbledon, S.W.19, accountant (permanent chairman), and H. C. Wright, 9, Mincing Lane, E.C.3, incorporated accountant. Qualification, £10. Remuneration as fixed by the company. Secretary: H. C. Wright. Registered office: 9, Mincing Lane, E.C.3.

Official Returns of Electrical Companies.

Robert Crust, Ltd. (184,087).—Capital, £1,000 in £1 shares. Return dated September 22nd, 1925. All shares taken up. £699 paid. £301 considered as paid. Mortgages and charges, nil.

Dartmoor Electric Supply Co., Ltd. (110,871).—Capital, £2,000 in 10s. shares. Return dated November 5th, 1925. All shares taken up. £2,000 paid. Mortgages and charges, £4,000 of 4½ per cent. first debentures; £3,950 of 6 per cent. second debentures (£3;550 held by bank as collateral security).

John Spencer, Ltd. (56,764). — Capital, £75,000 in £5 shares (10,000 preference and 5,000 ordinary). Return dated May 21st, 1925 (filed February. 17th, 1926). 10,000 preference and 1,027 ordinary shares taken up. £55,135 considered as paid. Mortgages and charges, £25,000.

Herbert Smith & Jones, Ltd.—E. H. Smith, of 24, Sedgeford Road, Old Oak Road, London, was appointed receiver and manager on February 24th, 1926, under powers contained in debenture dated May 4th, 1925.

W. E. Booton, Ltd.—Mortgage dated February 22nd, 1926, to secure £3,000 charged on warehouse and premises, No. 9, Wanlip Street, and three messuages adjoining numbered 3, 5 and 7, Wanlip Street, Leicester. Holder: H. Pratt, Nicholas Street, Leicester.

Electrical Specialities Co., Ltd.—F. C. Young, of 45, Bank Street, Sheffield, ceased to act as receiver or manager on March 2nd, 1926.

Coates & Co. (Sheffield), Ltd.—F. C. Young, of 45, Bank Street, Sheffield, ceased to act as receiver or manager on February 28th, 1926.

W. J. Tough & Partners, Ltd.—E. J. Barnes, of 24, Cambridge Road, W.4, ceased to act as receiver or manager on October 21st, 1925.

Interchangeable Electric Signs, Ltd.—Particulars filed of £4,380 debentures, authorised February 26th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Underground Electric Railways Co. of London, Ltd.

Lord Ashfield presided at the annual meeting on March 11th, and in presenting the report and accounts said that an agitation had sprung up among the independent omnibus proprietors in opposition to the proposals of the Minister of Transport to restrict the number of omnibuses upon the streets of London. That was a matter of serious importance to men who had perhaps invested all their savings in their omnibuses. As there was no provision for compensation under the London Traffic Act, the Minister had suggested that omnibus owners should set up a voluntary fund from which assistance could be provided for those who suffered financial loss from the restrictive methods. The company was agreeable to participate in such a fund. The chairman then reviewed the past year's working of the companies in which the company was interested, including the North Metropolitan Electric Power Supply Co., stating that the income from investments had declined by £53,000. The total capital of the companies was now £66,430,000, and of this the public held 68 per cent. and the company and its associates 32 per cent. Dealing with the company's capital, Lord Ashfield referred to the fact that when the 4½ per cent. bonds and 6 per cent. income debenture stock were issued, with the interest paid free of tax, the income-tax was only 1s. in the £, whereas it was now 4s., apart from the disparity between the British and American exchanges which had occurred in the meantime. For 24 years £5,000,000 of the capital invested in the company had received no return whatever. He was prompted to believe, however, that there were better times ahead; the company was getting into a position in which the chances of a dividend were distinctly encouraging. The amount carried forward was £146,000, and it had grown slightly each year. The prospects of the subsidiary companies were growing brighter, and the conservative policy which had been followed in past years was beginning to bear fruit. They had to straighten several things out before they commenced paying an ordinary dividend, for once that was commenced they wanted to continue it. At the moment he had no definite capital reorganisation scheme to lay before them, but the matter was receiving serious consideration.

County of London Electric Supply Co., Ltd.

The balance available for 1925, after meeting all expenses and adding £74,399 brought forward, is £798,218. Debenture interest and sinking fund absorbs £72,795; £70,000 is carried to contingencies reserve; £150,000 is placed to reserve for depreciation, renewals, &c.; £335,000 is transferred to general reserve; leaving a balance of £170,424, to which is added £108,337 interest on share capital chargeable to "Barking Supply," making £278,761. After providing for preference and interim ordinary dividends, it is proposed to pay a final dividend of 10 per cent. on the ordinary shares (making 15 per cent. for the year), and to carry forward £24,098. The applications received during the year amounted to the equivalent of 25,187 kW in respect of general business and bulk and railway supplies, making the total at December 31st 166.394 kW. The amount of energy sold increased from 78,840,134 kWh to 93,845,622 kWh. The total number of consumers supplied directly or indirectly by the company shows an increase for the year of 8,391, and the total is now over 70,000. The report makes reference to the opening of the Barking station by H.M. the King; the issue of £2,000,000 of 6 per cent. cumulative preference shares; the passing of the London Electricity Supply (No. 1) Bill; the appointment of Mr. A. Page, M.I.E.E., as an additional director, &c. The meeting is to be held on March 23rd.

Para Electric Railways and Lighting Co., Ltd.

The report for the year ended November 30th last shows that the net revenue was £60,311, as compared with £33.664 in the preceding year. After deducting London expenses and debenture interest the result is a net profit of £17,354, as compared with a deficit of £11.209. During the year debenture interest payments were brought up to date; the sinking fund is still three years in arrears. The Para Municipality has sanctioned a revision of fares, and the outlook is said to be more hopeful.

British Insulated Cables, Ltd.

The directors' report for the year ended December 31st last records a profit of £670,000, to which is added £221,710 brought forward, making £892,010. After deducting directors' fees, debenture interest, preference and interim ordinary dividends, &c., and allocating £75,000 to depreciation and £333,333 to reserve, there remains a disposable balance of £358,251. As we have already reported, the directors recommend a final dividend of 5 per cent., and a bonus of the same amount on the old ordinary shares (making 15 per cent. for the year), and a dividend of 5 per cent. and a similar bonus on the new ordinary shares, leaving £224,918 to be carried forward. The directors state that the substantial increase in profit is due to a number of causes, including increased turnover, new plant and buildings, enhanced efficiency, and the satisfactory completion of some long-term contracts. Reference is made to the capitalisation of £333,333 of the reserve and its issuance in the form of ordinary shares as a bonus. The meeting is to be held in Liverpool on Monday next.

Brompton and Kensington Electricity Supply Co., Ltd.

The revenue account for 1925 shows a balance of £57,633, to which is added interest amounting to £347 and a balance of £4,982 brought forward, making £62,962. The payment of the interim dividends left £48,081, which it is recommended should be dealt with as follows:—To depreciation account, £4,463 (making £100,000); to reserve fund, £28,700 (making £58,700); final preference dividend, £270; final ordinary dividend at the rate of 10 per cent., free of tax (making 10 per cent., free of tax, for the year); carried forward, £33. The connections (35-W lamp equivalent) rose from 561,559 to 591,768, and the number of consumers from 9,389 to 9,723. The average price obtained per kWh fell from 4.91d. to 4.86d. Reference is made in the report to the reorganisation schemes. The meeting was to be held yesterday (Thursday).

Bristol Tramways and Carriage Co., Ltd.

The revenue for the past year amounted to £1,041,410 and expenses to £937,122. The net revenue, including the balance brought forward, is £108,925. Debenture interest and preference and interim ordinary dividends absorbed £65,510, and it is proposed to deal with the balance, £43,414, as follows:—Final dividend of 4 per cent. on the ordinary shares (making 7 per cent. for the year); £10,000 to reserve for contingencies and renewals; leaving £5,414 to be carried forward. The reserve fund now stands at £360,332. The receipts of the tramway department showed an increase of £16,413 and those of the carriage department one of £47,146. The number of passengers carried during the year rose from 91,484,503 to 99,846,603. The report refers to the death of Mr. H. F. Cooper, who had been with the company for 40 years, 25 as secretary. The meeting was to be held yesterday (Thursday).

Metropolitan Electric Supply Co., Ltd.

The report for the past year records a gross revenue of £732,842 and expenses amounting to £309,044, leaving net revenue of £423,798, as compared with £392,372 in 1924. To this is added a balance of £10,806 from the previous account and interest, &c., amounting to £26,074, making £457,678. From this £200,000 is placed to the depreciation and reserve account, and, deducting debenture interest, pensions fund provision, preference and interim ordinary dividends, &c., there remains £91,750. It is proposed to pay a final dividend of 8 per cent. on the ordinary shares (making 11 per cent. for the year, as in 1924) and to carry forward £11,750. The total connections increased by 13,780 kW during the year, bringing the total to 95,479 kW. £392,807 was spent on capital account.

Clyde Valley Electrical Power Co.

The report for the year ended December 31st last records a balance of profit of £291,741, to which is added £63,878 brought forward, making £355,619. After paying the preference and interim ordinary dividends, and transferring £90,000 to the contingency fund and £46,500 to the second preference share special reserve, there remains a balance of £145,369, which it is proposed to allocate as follows:—Final dividend on the 6 per cent. preference shares, £9,000; final dividend of 5 per cent. (making 8 per cent. for the year) on the ordinary shares, £53,250; writing off balance of 1924 share issue, £695; provision for altering and furnishing new offices and showroom, £15,000; carried forward, £67,424. The additional 25,000-h.p. turbo-alternator referred to in the previous report is about to be put into operation at Clyde's Mill. The construction work at the Falls of Clyde is progressing satisfactorily, and it is anticipated that the power stations will be in operation in about 12 months' time. A clause protecting the company's interests was obtained in the Glasgow Boundaries Act, 1925. The meeting is to be held on March 24th.

German Companies.

The *Elevated and Underground Railway Company*, of Berlin, states that the net profits for 1925 amounted to 8,800,000 marks, as compared with 6,110,000 marks in the preceding year. The dividend is increased from 5 per cent. to 7 per cent.

The *German Telephone Works and Cable Industry Company*, Berlin, reports that although the degree of activity in 1924-25 was not uniform, it was satisfactory on the whole. The accounts show net profits of 476,000 marks and permit of the payment of a dividend at the rate of 6 per cent. No distribution was made in the previous year.

The *Electro-Works Company*, which is owned by the Reich, states that the extension of the works was continued in 1925, and after the completion of the developments in hand the total capacity in Zschornewitz and Lauta will amount to 400,000 kW. The total production showed a satisfactory increase, while the mines turned out 3,800,000 tons of crude lignite. The net profits increased from 4,450,000 marks in 1924 to 5,000,000 marks last year, and the dividend is increased from 7 to 8 per cent.

The *Siemens and Halske Company* reports gross profits and balance forward amounting to 9,591,000 marks for 1924-25, as compared with 3,321,000 marks in the previous year. The net profits are returned at 8,894,000 marks, as against 2,649,000 marks in 1923-24. It is proposed to pay a dividend at the rate of 6 per cent. No distribution was made in the preceding year.

The *Electricity Company* (*late Schuckert*), of Nuremberg, records receipts totalling 2,806,000 marks as against 1,088,000 marks in 1923-24, and a net profit of 1,979,000 marks, permitting of the distribution of a rate of 4 per cent. as compared with *nil* in 1923-24.

Belgian Company.—*Société Internationale d'Energie Hydro Electrique.*—This company issued during the week an advertisement, in compliance with Stock Exchange requirements, setting forth particulars of its constitution and objects. The latter are to found, acquire, operate, &c., transport or allied undertakings. It has important holdings in the Barcelona Traction, Light and Power Co., Ltd., the Mexico Tramways Co., Ltd., the Mexican Light and Power Co., Ltd., and the Société d'Electricité de la Région de Malmèdy (Serma). It has an authorised and issued capital of 162,500,000 fr., in addition to 40,000 founders' shares of no nominal value.

Stock Exchange Notices.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

Hopkinsons.—350,000 ordinary shares of £1 each, partly paid and fully paid, Nos. 350,001 to 700,000. 360,000 7 per cent. cumulative preference shares of £1 each, partly paid and fully paid, Nos. 1 to 350,000.

The undermentioned have been ordered to be officially quoted:—

Singapore Traction Co.—71,469 ordinary shares of £1 each, fully paid, Nos. 93,740 to 165,208, and 47,110 7 per cent. cumulative preference shares of £1 each, fully paid, Nos. 152,891 to 200,000.

Companies to be Struck off the Register.—The names of the undermentioned companies will be struck off the register at the expiration of three months unless cause is shown to the contrary:—

Blooms (Wireless), Ltd.
Broadcast Wireless Co., Ltd.
Car Electrical Service, Ltd.
Electricians, Ltd.
Expert Electrical Co., Ltd.
Magniphone Co., Ltd.
Manchester Wireless Installation Co., Ltd.
Wilton Wireless Co., Ltd.
Wireless Telephones, Ltd.

Imperial Tramways Co., Ltd.—After paying debenture interest and the interim preference dividend the balance available from 1925 is £14,686. The remainder of the 6 per cent. preference dividend is to be paid, £6,048 is transferred to the reserve for depreciation and contingencies, and a balance of £3,838 is carried forward. A dividend of 7 per cent. was received by the company in respect of its holding of ordinary shares in the Bristol Tramways & Carriage Co., Ltd., but the London & Suburban Traction Co., Ltd., was unable to pay any dividends. The meeting is to be held to-morrow (Saturday).

Newcastle and District Electric Lighting Co., Ltd.—After meeting debenture and loan interest, allowing £20,000 for depreciation, and adding £6,000 to general reserve, there is a net profit of £16,380 for the past year. To this is added £15,834 brought forward, making £32,214. The directors recommend the payment of a dividend of 7 per cent., leaving a balance of £15,544 to be carried forward. A further amount of £4,300 of the second mortgage debentures was redeemed and loans amounting to £2,994 were repaid during the year. Meeting: To-day (Friday).

Arbroath Electric Light and Power Co., Ltd.—The annual report states that the profits for the past year were £6,759, to which is added £1,212 brought forward making £7,971. The directors proposed to apply £2,000 to reserve and renewals fund, making the amount £24,500; to pay a dividend of 8 per cent. per annum on the ordinary shares; to pay an additional dividend of 1 per cent. on the preference shares, making 6 per cent.; and to carry forward to next year's accounts £1,654. The meeting was held on March 12th.

British Electric Transformer Co., Ltd.—The directors propose to pay the preference dividend of 7 per cent. for the two years ended June 30th, 1925. (Six months' dividend already paid.)

Notting Hill Electric Lighting Co., Ltd.—Final dividend of 10s. per share, free of tax, on the deferred shares, making 14s. for the year, as in 1924.

British Aluminium Co., Ltd.—Final dividend on the ordinary shares at the rate of 12 per cent. (making 10 per cent. for the year), and a bonus of 2½ per cent.

Chelsea Electricity Supply Co., Ltd.—The profit for the past year was £67,062 and the addition of the balance brought forward and interest makes a total of £76,854. Debenture interest and interim dividends absorbed £16,283 and it is proposed to deal with the balance (£60,571) as follows:—To reserve for renewals &c., £17,000; to reserve fund, £24,000; final preference dividend, £900; final dividend at the rate of 15 per cent. on the ordinary shares (making 12 per cent.), £18,539; carried forward, £132. The amount of energy sold rose by 561,013 kWh to 7,092,550 kWh. The report refers to the passing of the London Electricity (No. 2) Act and to the death of Major W F. Woods, a director, whose place has been taken by Mr. P. D. Tuckett. The meeting is to be held on March 24th.

Woking Electric Supply Co., Ltd.—The report for 1925, which was presented at the annual meeting on March 10th, showed a balance of £33,422; the addition of £1,963 brought forward made available £35,386. After meeting taxation and debenture interest and paying the dividends on the three classes of preference shares, there remained a balance of £24,546, which it was decided to allocate as follows:—To depreciation and renewals fund, £8,000; to reserve account, £8,000; to change-over account, £4,000; dividend of 10 per cent., free of tax, on the ordinary shares; carried forward, £1,825. The number of consumers rose from 3,218 to 3,451, and the lamps connected from 261,489 to 275,602. The report made reference to the death of Mr. J. Ashby, a director.

Tynemouth and District Electric Traction Co., Ltd.—The total revenue for 1925 was £46,123 and the expenditure (including £5,000 for renewals) was £39,450. To the balance is added £1,862 brought forward, giving £8,535. It is proposed to pay the 5 per cent. preference dividend and one of 10 per cent. on the ordinary shares, leaving £2,369 to be carried forward. Meeting: March 22nd.

Bruce Peebles & Co., Ltd.—The profit for 1925, including the balance brought forward (£9,141), was £58,131. It is proposed to transfer £5,000 to taxation reserve, £5,000 to depreciation reserve, and £10,000 to general reserve; to pay a dividend of 10 per cent. on the preference and ordinary shares and a bonus of 5 per cent. upon the latter (as in 1924); and to carry forward £8,655.

Tees Power Station Co., Ltd.—The company's profits for 1925 were £85,693, and the addition of £1,231 brought forward makes £86,924. After meeting debenture interest and transferring £20,000 to reserve, the directors recommend a dividend of 3¾ per cent., leaving a balance of £1,764 to be carried forward. The previous dividend was at the rate of 2¼ per cent. The meeting was held on Wednesday last.

Hastings and District Electric Tramways Co., Ltd.—The report for 1925 shows a profit of £11,430, to which is added £1,284 brought forward, making £12,716. It is proposed to pay a dividend of 2½ per cent. on the ordinary shares, to allocate £2,500 to depreciation and £500 to the reduction of the suspense account, and to carry forward £1,562.

County of Durham Electrical Power Distribution Co., Ltd.—A profit of £44,764 was made during 1925. Debenture and loan interest, &c., absorbs £12,542, and a balance of £2,119 from the last account is added, making £34,341. It is proposed to pay a dividend of 6 per cent. and to carry forward £2,242.

Alley & Maclellan, Ltd.—The preference shares are to receive their second half-year's dividend, but the directors do not recommend any distribution on the ordinary shares. £10,317 is allocated to depreciation and £12,332 is carried forward.

Western Union Telegraph Co.—A quarterly dividend of $2 per share has been declared. The company proposes to increase its capital by $5,000,000 in connection with the employés' stock subscription scheme.

Metropolitan-Vickers Electrical Co., Ltd.—A dividend of 8 per cent. is recommended on the ordinary shares, as in 1924. The meeting is to be held on March 23rd.

Stewarts & Lloyds, Ltd.—Out of the past year's profits the directors propose a dividend of 7½ per cent. on the deferred shares, as against 12½ per cent. in 1924.

Manila Electric Co.—A dividend of 50 cents per share has been declared on the common capital stock for the quarter ending March 31st.

Stocks and Shares.

Monday Evening.

The dividends and reports of the companies dealing with electricity supply and electrical power distribution in respect of the year 1925 may be considered as extremely satisfactory. The reports are now virtually all issued, the dividends announced and, in some cases, the meetings held. On all hands the tale is the same; increased demand, willingness on the part of the public to use the "juice"; opportunities that open up fresh developments in every direction. There are very few branches of industry in this country that command anything like the same amount of hopefulness as the electrical trade has done, and is doing.

The County of London Electric Supply Co., Ltd., increased its net revenue from £650,500 to £723,800, and again paid 15 per cent. dividend on the ordinary shares, the same rate as that distributed in each of the two preceding years. For 1926 the dividend will be limited to 10 per cent. on the shares, but the reserves are to be capitalised, of course, and parcelled out amongst the shareholders, dividends on such capital being duly paid. Shareholders who look for no diminution in their income are not likely to be disappointed. City of Londons are lower at 45s. 9d., Bournemouth & Poole went back to 60s. 9d. A few sixpenny falls occurred in other shares, amongst them being Clyde Valley at 29s. 6d. The Clyde Valley report shows that the revenue from sales increased last year about 3½ per cent., and the company retained a fair amount, the dividend on the ordinary shares being kept at 8 per cent., in spite of the extra capital now ranking.

The Newcastle & District Lighting Co., of course, has nothing to do with the Newcastle-upon-Tyne Supply Company, being confined to the city and a few suburban areas. The dividend of 7 per cent. is ½ per cent. higher than that of last year, and compares with 6 per cent. for 1923. The ordinary shares stand at 20s., and the Company's 4½ per cent. mortgage debenture stock at 80.

The Tees Power Station is a subsidiary of the Newcastle-on-Tyne Supply Company, and has increased its dividend from 2¼ per cent. to 3¾ per cent. The Company's 6 per cent. first mortgage debentures are quoted at 102. The Newcastle-on-Tyne Electric Supply Company repeats its previously paid 7 per cent. on the ordinary capital, now much larger than it was a year ago. The profits for 1925 were £701,700, or £41,000 higher than those of 1924.

The Eastern Telegraph Company has declared its usual dividend of 2½ per cent. tax free for the quarter, and the Eastern Extension Company the same. Both of these are the final dividends for the year. Eastern Extensions are ½ down at 18, while Eastern ordinary shows no change at 177½. Westerns are dull at 17⅝. Anglo-American deferred is a little lower at 23⅝. A florin fall in Automatic Telephones reduced the price to 50s. Orientals are easier at 2 1/16. Weakness in Marconis reduced the price to 22s. 6d., the market failing to make any headway against the continual stream of sales which filters in from holders disappointed at the incessant sagging of the price. Radio common are 7½, the preferred 9½, and Canadian Marconis 4s. 4½d.

British Insulated ordinary at 3 3/16 have risen the fraction, and there has been substantial buying of the shares during the past few days. India Rubber shares are a little lower at 1 3/16, from which it might appear as though some of the proprietors had been selling their shares in order to apply for the company's 5 per cent. first mortgage debenture, issued at 93 and redeemable in 1936. The debenture stock is an excellent investment and pays—oddly enough—better interest on the money for the time being than the shares afford, though it is scarcely necessary to say that expectation looks for a higher dividend on the latter in the future. Small declines occurred in Siemens, Metropolitan-Vickers ordinary and Babcocks, owing to the fear of the threat of an engineers' lock-out being put into effect, although the latest news suggests a hope that it may not take place after all. British Aluminium are good at 39s. 6d., and Callenders strengthened to 3 9/16.

A prospectus has been circulated of a new issue of Electric Light and Power Extension capital of 8 per cent. cumulative preference shares in the Wareham Electric Supply Co., Ltd. Another of the same sort is the prospectus of the South Midlands and Berkshire Electric Light and Power Co., in which preference shares and debentures are offered. These are both parts of the same group of companies which we have criticised on previous occasions, the chairman of each being Sir Charles B. H. Soame, Bart. Investment should give the issues a wide berth.

Lord Ashfield, at the meeting of the Underground Electric Railways of London, caused disappointment by not outlining a scheme for the reorganisation of the Company's capital. The shares had risen on the anticipation that he would propound such proposals, but the prices, while reacting from the best, retain improvements on balance. His Lordship did definitely declare, however, his hope that next year there may be at last a dividend on the Company's ordinary and "A" shares. Metropolitans and Districts are both lower. The tramway issues hold their rises of last week, but have made no further progress. British Electric Traction has risen 5 points. Of the foreign shares, Brazilian Tractions are unchanged at 94. Para Electric Railways & Lighting shares have stiffened to 5s. on a report which shows the Company to have secured a profit last year of £17,300, against a loss of £11,300 in 1924.

Mexican Utilities are weak, the position in Mexico appearing to become worse instead of better. The various American Utilities, which underwent sharp falls in the New York panic of a fortnight back, have regained most of their declines. Rubber shares are higher, thanks to a recovery to half-a-crown per lb. in the raw product. The infusion of greater cheerfulness into the market, caused by this improvement, has not led to any great expansion of business. It may be said, in point of fact, that all markets in the Stock Exchange are suffering from want of public orders, the reluctance to deal being mainly due, of course, to the very unsettled state of affairs that prevails in too many directions at home and abroad.

Recrystallisation of Electrolytic Iron.—The stamping and drawing of metal sheet into various, and sometimes rather complicated, shapes plays a very important part in manufacturing operations. Low-carbon steel or open-hearth iron sheets are usually employed commercially for this purpose, but electrolytic iron sheet has recently been advocated as a very suitable material for such operations. Preliminary annealing of the sheet prior to stamping or drawing is necessary; in addition, intermediate annealing between different stages in drawing, in order to remove the "work hardness" and enable the sheet to withstand the deformation of subsequent stages, must often be resorted to. As a bearing on this problem a study has recently been carried out by the Bureau of Standards of the recrystallisation temperature of cold-rolled electrolytic iron and open-hearth steel strip; the mechanical properties of the cold-rolled materials after annealing at various temperature intervals up to 700 deg. C. (1,290 deg. F.) were determined and the microstructural changes were studied. The results showed that the electrolytic iron sheet of the composition used was noticeably lower in its recrystallisation temperature than the open-hearth steel sheet which was compared with it. A marked recrystallisation was noted in severely cold-rolled electrolytic iron sheet after it had been annealed for half-an-hour at 500 deg. C., together with pronounced softening of the work-hardened sheet, whereas a similar change in the open-hearth steel sheet was not noted until after it had been annealed at 600 C. for half-an-hour. This difference in the recrystallisation temperatures of the two materials (100 deg. C.) may prove to be a factor of considerable importance in promoting the use of electrolytic iron sheet.—*Reuter's Trade Service* (Washington).

The Need for Statistics of the Electrical Industry.

By HARRISON DENT.

Adequate statistics are essential to efficient production and marketing. The electrical industry, in common with most industries in Great Britain, lacks a central source of classified statistics. There are many bodies which carry out development work on behalf of sections of the industry, but as yet their activities have been confined to limited attempts at recording useful data and movements.

Recently the B.E.A.M.A. has been developing this work, the E.D.A. has attempted to carry out investigations in Great Britain, and the E.L.M.A. has fostered the use of electric lighting through researches. In addition, the Electrical Review independently publishes and analyses data on foreign markets for electrical goods and on annual growth of electrical exports.

It would seem, however, that there is a need for a centralised bureau which should act for the whole industry, collect and classify data, issue reports on growth, and trend and carry out studies of home and foreign markets.

When we turn to U.S.A. we find that there is far more knowledge for trade consumption about the development of the electrical industry and about the markets for electrical merchandise.

Consider the home market for domestic electric appliances. It is obviously inefficient to advertise these goods in districts where electricity supply is lacking, very little developed, or too costly for the economical operation of common domestic appliances. It is equally inefficient to produce such appliances in quantity and to attempt to sell them in localities which constitute "unknown markets" in the sense that the degree of usage of electrical power and of electric domestic appliances is unknown, and the trend of growth uncharted.

If we attempt to apply engineering methods to marketing and distribution, and this surely is most essential, we shall look round for some gauge or yardstick which may indicate where the best market lies and where we should avoid setting up a distribution point.

In attempting to plan a scientific analysis of the market, we must obtain true indices; the number of supply authorities in a given area, the total private consumption of electrical power, the total domestic consumption of electrical power, the number of private consumers of electricity, consumption *per capita*, development programmes of the authorities, the number of electrical retailers, and the quantity of various electrical appliances sold per annum. These are figures which will tell us what we want to know about our market, and if we can obtain them over a period of years, we shall have valuable indices of growth and trend for each area considered and overall. Apart from this information purely relating to the industry, it is advisable to obtain data of a more general character concerning population, its classification, density, and distribution, and general indices of richness of the community such as rateable value per head of population, &c. Further essential data are the cost per unit of each supply undertaking for light and for power, and the local cost per therm or per 1,000 cubic feet of gas supply.

Given this collection of figures, we can analyse it and determine by logical means where the most favourable markets lie and where we should attempt to sell our merchandise.

We have arrived at a point at which we have tabulated the categories of desired data, and our search for these data commences.

Where are the data?

Much of this information is systematically collected by the Electricity Commissioners, and appears in their periodical reports.

Supply authorities are recorded also in "Garcke's Manual," in "The Electrician Annual Tables," and in "The Electrical Engineers' Year Book," and figures of consumers are most fully recorded at the back of the last-mentioned publication, although partially recorded in the other two publications. However, there are gaps in all of them, for it appears that certain supply authorities refuse to give these figures for public consumption, although the reason for this reticence is difficult to understand (if there is a reason).

All these available records must be combined and built up into figures which shall represent territory units, for they are not classified under counties. The total consumption for private supply is recorded in the *Electrical Times* supplements on supply authority results, but there is no separate record kept by companies of domestic consumption, and such records are not practicable universally. The only gauge of this factor is the load increase above normal, which supply authorities receive who have specially developed the domestic business.

Per capita consumption is an index of the degree to which electrical power is consumed by the individual consumer, and is more an index of industrial electrical development than domestic. However, it is logical to assume that in districts where the industrial load is very high, the cost per unit to the individual consumer is likely to be low, and hence the inducement to purchase on the part of the domestic consumer will be strong.

Records of electrical retailers in districts are contained in "The Electrical Engineers' Year Book." Concerning the quantities of various electrical appliances sold, this information cannot be gathered without employing the questionnaire system and circularising all retailers as to quantities, makes, and types sold. Given a good response to such circularisations, this method is most valuable to enable manufacturers and retailers to estimate the trend of consumption and taste throughout the country.

Statistics relating to the price of electricity and gas are of great value for competitive purposes. It is estimated by the E.D.A., after considerable test, that electricity can compete on costs with gas when the ratio of cost per therm to cost per kWh is about 8:1. In the instance of cost of gas being recorded in 1,000 cubic feet, the ratio should be about 30:1. These figures provide a guide from the view point of economical operation alone, and it is obvious that in instances when gas is slightly cheaper to use than electricity, the advantages of the latter as a form of power must outweigh the difference in cost.

It is admitted that apart from purely statistical considerations, an exhaustive study of any given locality should include a study "on the spot" to determine the local taste, local activities of electrical undertakings, &c., which will exert a bias on the conclusions derived from a purely mathematical analysis. However, this statement does not imply any doubt as to the value of such an analysis. The "local characteristics" study is a supplement and not a substitute.

We see that the work of securing these all-important data is considerable, for it involves reference to many sources, questionnaire methods, and the laborious compilation of numerous statistics into statistics representing counties or similar areas. This work forms part of an electrical development campaign, and is worth investigating by a central body for the benefit of the trade.

We have taken the domestic appliance field as one example, but the illustration is typical of the methods that could be applied to every other branch of electrical manufacturing and merchandising. For foreign

markets we need data on imports of the lines concerned, and on power development in a parallel manner.

The supply of useful data for gauging markets at home and abroad is carried out by many other bodies, the activities and resources of which are not fully appreciated. The Board of Trade, and that most useful and energetic department, the Department of Overseas Trade, work continually on behalf of the British manufacturer and trader. Import and export statistics for Great Britain and every other country are available for all British inquirers. Special information concerning agents and traders abroad, special studies of particular trades or commodities, reports on economic conditions abroad—these are a few of the manifold activities of the Department of Overseas Trade.

Another body which carries out a wide service for industry and trade is the Federation of British Industries. The *Bulletin* of the F.B.I., apart from its trade data, includes an economic forecast which is very valuable. Special reports on conditions abroad are a notable feature of the Federation's work, including foreign prices, activities of foreign competitors, methods of merchandising, local customs, and similar important information.

Again, there are libraries which contain essential data for the service of all who care to investigate. The Patent Office Library has a most exhaustive collection of technical works, and the British Museum Library contains a fine collection of reference volumes. Perhaps the least known, and yet most valuable of all libraries for many purposes is that of the London School of Economics. This remarkable library is open to any one who needs information, and its reputation abroad is, curiously enough, far higher than in Great Britain, where its huge resources are not generally appreciated. Special investigations are carried out by the staff of this library, and it contains many important volumes not obtainable in any other library in the country.

It is apparent that manufacturers and others who need information have sources to supply them with what they want, but the information is not centralised, and much time and labour must be spent to secure it. Each industry has special needs, and the value of the data that would be obtained would certainly justify the setting up of a research institution or body by the electrical industry, and its centralised nature would make for efficiency in operation. If the cost of upkeep were distributed over members of the industry, the cost to each member would be insignificant compared with the value of the work carried out.

While there is at yet no particular body in being which actually does carry out researches of the type indicated, the B.E.A.M.A. has already instituted a production index, and it seems that this body might be in a position to investigate market potentialities, distribution methods, &c., for the industry.

The whole question, embracing as it does manufacturing, distribution and selling, forms part of the wider category known as "Business Research." In U.S.A. this science, for it is incontestably a science, has been slowly developing, and we await the birth of a technique here as in other sciences and professions.

The application of scientific principles and methods to every process involved in the conduct of an individual business and of the industry of which it forms part may be new, but it is none the less desirable. We would be more correct in saying that it is essential. Of all the industries, surely the first to realise this must be the industry of engineers, and in this industry, the electrical engineering group should take the lead.

Conditions in South America.

Reports on Argentina and Brazil.

ARGENTINA.

Mr. H. O. Chalkley, C.B.E., Commercial Secretary to the British Legation, Buenos Aires, has presented a report (to September, 1925) upon the financial, commercial, and economic conditions in the Argentine Republic to the Department of Overseas Trade.*

In his introduction, Mr. Chalkley stresses the importance of the trade between this country and Argentina in which the latter State has the better share, the income from British investments being insufficient to redress the adverse balance against Great Britain. Mr. Chalkley says that if British exports have not benefited to the extent hoped for, it is not due to the state of trade in Argentina, or to diminished purchasing power, but to the prices of British goods and the greater intensity of foreign competition. In spite of divergences in most other aspects of trade, every agent and importer admits that it is easy to sell British goods when their prices do not exceed those of foreign products.

Electrical Imports.

It is stated that imports during the first half of 1925 remained at about the same level as in the first six months of 1924. The principal items, in their order of importance, were electric wire and cables, dynamos and motors, insulating tubes, electric batteries, battery materials, insulators, electrical material and accessories in general, and incandescent lamps. In electric wire and cables German and British manufacturers held the trade, the former leading slightly. Americans practically monopolised the market for batteries, which were principally of the automobile pattern. German manufacturers supplied over 50 per cent. of the dynamos and motors. In tubes British firms held the lead, followed closely by German suppliers who specialise in Bergmann tubing. British manufacturers were also the principal suppliers of battery materials—mainly for the British-owned railways. In porcelain insulators Germany secured 80 per cent. of the trade, while the lamps came principally from Holland and the United States. Electrical material and accessories in general were divided between German, American and British manufacturers. An appendix to the report contains detailed statistics of the electrical imports during 1923 and 1924. These show that in 1924 Great Britain made a considerable advance as a supplier of wire and cables and dynamos and motors.

*Stationery Office, 2s. 6d. net.

Power Developments.

The report says that some interest has been revived in the scheme for the utilisation of the Iguazu Falls, some 700 miles from Buenos Aires, on reports from New York that it is considered feasible to convey 300,000 h.p. from the falls to supply Buenos Aires with electricity at a cost not exceeding 60 per cent. of the present price. The cost of the scheme has been estimated at $50,000,000 (American).

The Government has granted the company supplying electricity to Buenos Aires a concession to reclaim land in the vicinity of the new port works for the purpose of erecting a projected new power station with a capacity of 500,000 kW. It is estimated that the consumption of coal at this new station will be 4,000 tons a day and it is proposed to install a pulverising plant.

Tramways.

The five tramway companies operating in Buenos Aires showed, in the aggregate, an improvement in receipts during 1924. The only company whose revenue declined was the Port and City of Buenos Aires undertaking. The receipts from the surface tramways during the first five months of 1925 showed a slight decrease, indicating that motor-omnibus competition is beginning to make itself felt. The delay in reaching an agreement between the municipality and the tramway companies has led to the postponement of active measures for relieving the traffic congestion of the city. Reference is made to the scheme of the Anglo-Argentine Tramways Company for the construction of two new subways, one from north to south, connecting the principal railway termini, the other connecting the centre of the city with the north-eastern suburbs. The invitation for tenders for the construction of a new electric tramway system for the town of Rosario failed to attract offers, and it is considered possible that tenders will again be invited in the near future. Motor omnibus services remain uncontrolled and continue to add to the traffic problem.

Communications.

The United River Plate Telephone Co. has now 310 exchanges, 136,044 subscribers, and 719,700 km. of lines. It estimates that £20,000,000 will have to be spent during the next 10 years to cater for development. Several long-distance lines have been installed recently and the Buenos Aires-Bahia Blanca line (1,600 km.) is to be inaugurated shortly. The automatic system is in operation in Buenos Aires, Cordoba and Rosario.

The international radio service carried on by the Transradio Internacional (a British-German-French-American group) worked without interruption during the year under review. A second long-wave transmitter was to be put into operation last September.

The country is badly served with broadcasting owing to a lack of co-operation between the interests concerned. The transmissions are inferior and spoiled by too much advertising. A recent decree fixed 190 metres as the maximum wave-length for amateurs, and a band of from 200 to 425 metres for broadcasting.

The Italian Submarine Cable Co.'s new cable, connecting Italy and Spain with Brazil, Uruguay and Argentina, was landed in Argentina in May last, and services were opened later.

Trading Methods.

Suitable agents to represent manufacturers are said to be extremely difficult to find, except in the rare cases where handsome remuneration is assured from the outset. Care should be exercised in the appointment of agents, and inquiries through the banks, the D.O.T., or the British Chamber of Commerce, are advised. It should be ascertained whether applicants for agencies have not already too many irons in the fire. With regard to the collection of payments, Mr. Chalkley says that many agents arrange for remittances to be made direct to their principals. Importers in general do not ask for more than 90 days' credit.

There are said to be many varieties of goods in which British trade is low owing to the lack of advertisement or the use of unsuitable advertising. Argentine customers are very receptive to careful and systematic advertising of branded goods backed up by judicious propaganda.

BRAZIL.

A report on the economic and financial conditions in Brazil up to September, 1925, has been prepared for the D.O.T. by Mr. E. Hambloch, British Commercial Secretary at Rio de Janeiro.*

Mr. Hambloch says that the political disturbances of recent months have had little effect upon trade. The bulk of the population takes little interest and no part in politics, and politics and trade are entirely divorced from one another. A favourable trade balance of £27,000,000 in 1924 was an indication of economic prosperity, though largely due to the exportation of coffee. Home producers are very well protected and the result has been an increase in the cost of living which has created serious problems. The continuance of stability is expected to lead to a gradual improvement in the exchange position; at the date of the report exchange was firmer than it had been for many months past.

Electrical Imports.

In the general report it is stated that Great Britain's share of the imports of electrical material and apparatus amounted to 14 per cent., the principal competitors in this trade being Germany and the United States. At the date of the report complete figures of imports during 1924 for the whole of the country were not available, but in an appendix statistics of importation at the port of Santos, supplied by the British Consul at Sao Paulo are reproduced. Although these represent only about 25 per cent. of the total trade they are said to be indicative of the nature of the whole. The imports of insulated copper wire totalled 190 metric tons in 1924 as compared with 362 tons in 1923, and Great Britain's share fell from 11 to 2 tons. Electric cable imports decreased from 407 to 253 tons, while the British share rose from 40 to 118 tons, ousting the United States from the first place. The imports of "apparatus for electricity and electric light" rose from 802 to 1,253 tons, and Great Britain's quota from 57 to 131 tons. Dynamos and generators increased from 222 to 381 tons (Great Britain 1 and 119 tons); electric motors from 909 to 905 tons (Great Britain 28 and 17 tons); and transformers from 662 to 770 tons (Great Britain 11 and 18 tons). The statistics show that Germany was the largest supplier of electrical goods, having contributed 1,483 tons out of a total of 3,802 tons representing the classes mentioned above. The United States supplied 1,168 tons and Great Britain 405 tons. The Acting Consul at Bahia reports that 370 cases of electrical material were taken into that port in 1924; of these 170 came from the United States, 108 from Belgium, 78 from Germany, and 17 from Great Britain.

Electrical Power and Development.

The British Consul at Sao Paulo (Mr. A. Abbott) says that owing to a long drought and the rapid increase in consumption the City and State experienced a severe power shortage. A contributory cause in some respects was the lack of foresight on the part of the Light and Power Company which supplied (at what may be termed an absurdly low figure) other public utilities with power which the company itself had to obtain from other power concerns at a much higher rate. New power stations are being constructed as quickly as possible, including one on the Serra do Mar, which will develop about 200,000 h.p. and will be the largest in South America, and there is no doubt that every effort is being made to remedy past errors. The fact remained, however, that practically all local factories were working (at the date of the report) only three days per week and the situation was daily growing more serious.

* Stationery Office, 2s. net.

The Acting Vice-Consul at Maranham (Mr. J. G. Clissold) says that good progress was made in 1924 by the American contractors to the State Government with the work of improving the town of S. Luiz do Maranhao. The lighting system was completed in July and the trams commenced running later. The American company takes 10 per cent. of the gross receipts from the tramway and lighting undertakings.

Among other developments a new sugar mill in the State of Alagôas is mentioned. This will have a capacity for crushing 1,250 tons of cane in 24 hours and will be electrically operated —an innovation in Brazil.

Railway Electrification.

There is an urgent necessity of electrifying the suburban portion of the Central Railway of Brazil, as under existing conditions it is impossible to increase either the number of trains or the number of cars in each train. The system is said to be from 100 to 150 per cent. overloaded at the busy hours of the day and accidents have been frequent. Plans for the electrification of the West of Minas Railway from Barra Mansa to Angra dos Reis have been drawn up. At August, 1925, the position as regarded electrification was as follows:—Completed: Campos de Jordao Railway (46 km.) and the Paulista Railway (70 km.) from Jundiahy to Rebouças. Under construction: Paulista Railway (24 km.) from Rebouças to Tatú. Projected: Paulista Railway (further extension to Barretos, 368 km.) and the Sorocabana Railway (104 km.). All these lines are in the State of Sao Paulo.

Trading Methods.

Mr. Hambloch puts forward a number of points for consideration by those desirous of trading with Brazil. In the first place, he says, it must be remembered that the language is Portuguese, but for business purposes it is more important that a commercial traveller should have a thorough knowledge of the articles that he wishes to sell rather than that he should be able to speak Portuguese. The visit of a representative of a firm wishing to do business with Brazil facilitates the task of finding suitable agents, but in the event of this being impossible, the D.O.T. is willing to render assistance. In the latter case very full particulars of commission terms, prices, credits, &c., should be furnished and a full range of catalogues (in Portuguese if possible) should be sent.

Many home firms have representatives in Brazil, but the number of local agents with technical training is very small; British goods still maintain their high standard of excellence, but the main difficulty is one of price and credit. It is well to remember that the Federal Government itself is the largest purchaser in Brazil of railway material and of plant for public works installations. Important contracts are also given by the various State and municipal authorities. The importance of adequate, influential, and competent local representation is therefore obvious. Long credits are necessary; there is scope for sound business to be done if the financing thereof (from the purchaser's point of view) be studied first. Many public contracts are given by calls for tenders; but even in these cases it is almost invariably too late for home manufacturers to think of presenting tenders if the first advice they have is the official announcement. The position of British suppliers of all classes of iron and steel goods, railway material, electrical installations of all kinds and public works generally in Brazil requires careful examination. Every effort should be made to find some solution of present difficulties, in order that the outlook for British trade in this class of supplies to Brazil may become generally as satisfactory as in the case of supplies to local British railways. The United States, Germany, Belgium, and France are active competitors.

Institute of Industrial Psychology.—We have received a copy of the annual report for the year 1925 of the National Institute of Industrial Psychology. The report contains a review of the five years' work of the Institute since its commencement. During the year in question the membership increased by over 60 per cent. and the payments received for investigations carried out by the Institute showed an increase of 10 per cent. An effort is being made to raise a fund of £100,000 to place the body on a permanent footing, and it is satisfactory to know that a considerable response is being received.

A Large Electric Winder.—What is claimed to be, from the dimensional point of view, the largest electric winding equipment in the world, is shortly to be installed at the City Deep Gold Mines, near Johannesburg, by the Metropolitan-Vickers Electrical Co., Ltd. The plant is designed to lift a net load of 9¼ tons from a depth of 4,500 ft. Thirty-one loads per hour will be delivered at the surface, and the winding speed will be 3,707 ft. per min., or more than 40 miles per hour. The maximum peak load for the driving motor will be 12,500 h.p., and the motor will operate at 32.7 r.p.m., being direct coupled to a bicylindro-conical drum of 35/17 ft. diameter. The Ward Leonard system of control is being adopted, d.c. energy being supplied by two 2,000-kW generators driven by a 5,200-h.p. induction motor. The double motor is nearly 20 ft. in diameter, with a bore of 16 ft., and weighs about 300 tons. The drum shaft weighs over 50 tons, while the drums themselves weigh about 350 tons and carry 18 tons of rope.

The Electricity (Supply) Bill, 1926.

Summary of Clauses.

The Electricity (Supply) Bill was introduced into the House of Commons on Wednesday, last week, by the Minister of Transport, and was published on Friday.*

The following is a summary of the principal clauses of the Bill:—

Constitution and Powers of Central Electricity Board.

There shall be established a Central Electricity Board, consisting of a chairman and seven other members appointed by the Minister of Transport, who shall hold office for not less than five years, and shall be paid salaries determined by the Minister of Transport.

The Board will be charged with the duty of supplying electricity to authorised undertakers, but shall not, save as expressly provided, generate electricity; it may, with the approval of the Electricity Commissioners, enter into arrangements with any authorised undertakers or other bodies for the exercise of any of its powers which can more expediently be exercised locally. The Board is to appoint consultative technical committees consisting of engineers employed in connection with selected generating stations, to give advice and assistance on such matters as may be referred to them.

Provisions as to Scheme.

The Board shall, as soon as practicable, prepare and submit to the Electricity Commissioners a scheme—

(*a*) Determining what generating stations (whether existing or new) shall be the selected stations at which electricity shall be generated for the purposes of the Board;

(*b*) Providing for interconnection, by means of main transmission lines to be constructed or acquired by the Board, of selected stations with one another and with the systems of authorised undertakers;

(*c*) Providing for such standardisation of frequency as may be essential to the carrying-out of such interconnection;

(*d*) Enabling or requiring temporary arrangements (to be in force during the carrying-out of the scheme) to be made between the Board and owners of generating stations (whether authorised undertakers or not) with respect to supplies of electricity, and to the working of generating stations (whether selected stations or not) by the owners thereof, upon such terms as in default of agreement may be determined by the Electricity Commissioners;

(*e*) Containing such supplemental provisions as may appear necessary.

A private generating station is not without the consent of the owners to be included in the scheme as a selected station, nor will the owners of such a station be required to enter into any temporary arrangements under the scheme.

The Electricity Commissioners are to cause the scheme to be published, and to give authorised undertakers and other persons interested an opportunity of making representations thereon, and after considering such representations, may confirm the scheme subject to such modifications as they think fit. As soon as the scheme is confirmed by the Electricity Commissioners it will be the duty of the Board to give effect to it.

The Board is to make arrangements with the owners of existing selected stations for them to be operated in accordance with the provision of the Act, and for such extensions and alterations as may be required: Provided that if the owners consider that any directions of the Board requiring extensions or alterations are unreasonable, they may appeal to the Electricity Commissioners, with a further right of appeal to the Railway and Canal Commission, against the decision of those Commissioners.

If the owners are unwilling to enter into or fail to carry out any such arrangements to the satisfaction of the Board, the Board is to be entitled to acquire the station at a price to be determined in accordance with the provisions of the First Schedule to the Act.

Where the Board acquires a station under this section, it may carry out such extensions or alterations as it thinks fit, and may either operate it or make arrangements with any authorised undertakers or other company or person to operate it: Provided that the Board shall not operate such a station unless it satisfies the Electricity Commissioners that it is unable to enter into an arrangement for its operation on reasonable terms.

The Board may make arrangements for the provision of such new stations as are required. If it is unable to enter into an arrangement with any authorised undertakers, company, or person for the provision of such new station on reasonable terms, the Commissioners may by a special order authorise the Board to provide the station, which may be operated by the Board if it satisfies the Commissioners that it is unable to enter into an arrangement for its operation on reasonable terms.

The owners of a selected station will be under the obligation to operate the station as the Board may direct, with due regard to economy and efficiency; and to sell to the Board all electricity generated at the station.

The owners of a selected station will be entitled to be supplied by the Board from that station with such electricity as they may require for the purposes of their undertaking, not exceeding the amount generated at the station.

The price to be paid by the Board to the owners of a selected station for electricity generated thereat is to be the cost of production, ascertained in accordance with rules contained in the Second Schedule to the Act.

The price at which electricity will be supplied by the Board from a selected station to the owners of that station will be either the cost of production, adjusted according to load factor, together with a proper proportion of the Board's expenses, or according to the tariff fixed under the Act for the supply of electricity by the Board, whichever is the lower.

If any question between the Board and the owners of a selected station arises under this section, it is to be determined by the Electricity Commissioners.

After a scheme has been confirmed as respects any area, the Board is to construct the main transmission lines required for the interconnection of selected stations with one another and with the systems of authorised undertakers in accordance with the scheme so far as it relates to that area.

Where a scheme provides for the acquisition of any main transmission lines belonging to any authorised undertakers, such lines shall, on payment of the price determined in accordance with the First Schedule, vest in the Board upon an order to that effect being made by the Minister of Transport.

The Board may require any authorised undertakers or the owners of any selected station to alter the frequency employed, if required to effect the standardisation of frequency provided by or under the scheme, or to effect such standardisation of frequency as the Board with the approval of the Electricity Commissioners may think expedient, subject to the payment of any expenses involved (including the cost of altering or replacing plant belonging to consumers). The Board may borrow for this purpose, but the resulting capital charges are to be excluded in assessing rateable value. The amount of the expenses incurred in carrying out any such requirement are in default of agreement to be determined by the Electricity Commissioners.

As soon as a scheme has been completed as respects any area, the Board will be under an obligation to supply to any authorised undertakers in that area demanding such a supply, such an amount of electricity as they require for their undertaking: Provided that the Board shall not supply electricity to authorised undertakers in the area of a power company without the consent of the company, or in the district of a joint electricity authority without the consent of the Electricity Commissioners.

Where it appears to the Board that the outlay incurred in providing the transmission lines required would entail unreasonable expense, the Electricity Commissioners may authorise the Board to impose terms and conditions on the giving of the supply.

Where any authorised undertakers owning a generating station, not being a selected station, demand a supply of electricity, the Board may make it a condition that they shall take the whole of the electricity required for their undertaking from the Board: Provided that the cost per unit to the undertakers will be less than the cost at which electricity is then being produced at the generating station of the undertakers; and the latter may appeal to the Electricity Commissioners, whose decision is to be final.

The Board may, before the carrying-out of the scheme in any area is completed, supply electricity to undertakers in that area.

The price to be charged by the Board for electricity supplied to authorised undertakers is to be in accordance with such tariff as may be fixed by the Board from time to time, so that the receipts shall be sufficient to cover the expenditure, including interest and sinking-fund charges, with such margin as the Electricity Commissioners may allow. The tariff is to show separately (*a*) a fixed charges component; and (*b*) a running charges component, and may be different for different areas.

Where any authorised undertakers take a supply of electricity from the Board, the price charged by them for the supply of electricity in bulk to any other authorised undertakers is to be on the same terms, together with such charges in respect of any transmission line used for the purpose as are mentioned in the Third Schedule; any question as to the amount of the price is to be determined by the Electricity Commissioners.

Where the owners of a selected station who take a supply of electricity from the Board prove to the satisfaction of the Commissioners that the cost of taking that supply in any year during the first seven years exceeds the cost which they would themselves have incurred in generating the like quantity of electricity, the charges will be so adjusted that the amount charged in that year does not exceed the cost which the undertakers would have incurred.

Where the Board notifies to any authorised undertakers owning a generating station, not being a selected station, that

* H.M. Stationery Office, Bill 59. Price 9d. net.

it is in a position to supply the whole quantity of electricity required for their undertaking on specified terms, and is satisfied that the cost of the supply on those terms is below the then prevailing cost to them, and they refuse to take such supply from the Board, then, if the Electricity Commissioners are satisfied as respects the next subsequent year that the cost of production of electricity generated by those undertakers substantially exceeded the cost they would have incurred had they purchased electricity from the Board on the specified terms, the Commissioners are to require the undertakers to make an abatement from the charges for electricity for the ensuing year equal to the amount of such excess.

Where any such undertakers have so refused to take a supply from the Board, it will not be lawful for them subsequently to increase their charges for electricity without the consent of the Commissioners. In calculating for this purpose the cost of production, no account is to be taken of capital charges in respect of the generating station.

The provisions of previous Acts relating to compensation for deprivation of employment are to apply to any officer or servant of any authorised undertakers affected by the closing or the acquisition of a generating station under or in consequence of this Act, as set out in the Fourth Schedule. The powers of authorised undertakers are extended to enable them to carry out arrangements with the Board notwithstanding any existing limitations.

Where the carrying-out of any scheme or arrangement would involve any operation for which the consent of the Minister of Transport or the Electricity Commissioners would be necessary under the Electricity (Supply) Acts, nothing in this Act is to relieve the Board or any authorised undertakers or persons concerned from the necessity of obtaining such consent.

Subsidiary Provisions as to the Board.

The Board is to be deemed to be an undertaker within the meaning of the Electricity (Supply) Acts, 1882 to 1922, but the provisions which relate to the purchase of undertakings by local authorities are not to apply to the undertaking of the Board. The Board is not to supply electricity directly to persons not being authorised undertakers, except the owners of selected stations, not being authorised undertakers, and, with the consent of the Electricity Commissioners, any company, body, or person requiring a supply for power purposes in any area not forming part of the area of supply of any authorised undertakers.

The Board may acquire land or rights over land voluntarily or compulsorily for the purpose of its powers and duties under this Act (including the construction of main transmission lines) like a local authority which is an authorised undertaker.

The Board may, by agreement with any authorised undertakers or other persons, use any main transmission lines upon such terms as may be agreed.

The Board and any company or person producing electricity by water power, waste heat, or otherwise, may enter into arrangements for the purchase of any surplus electricity which may be available, and may be authorised by the Commissioners to exercise such powers as may be necessary for the purpose.

The Board will annually make to the Minister of Transport a report of its proceedings under this Act, and furnish to the Electricity Commissioners such statistics and returns as they may require.

Financial Provisions.

All sums received by the Board will be paid into a separate fund, out of which the salaries of the members and the servants of the Board, and all expenses incurred by the Board will be paid.

The Board may, with the consent of the Electricity Commissioners and subject to regulations to be made by the Minister of Transport with the approval of the Treasury, borrow money, and the regulations may empower the Board to borrow temporarily by the issue of bonds or otherwise, and to make arrangements with bankers, and may apply any enactments relating to borrowing by local authorities.

Such powers of borrowing may be exercised for:—

(*a*) The construction or acquisition of main transmission lines, generating stations, and other works;

(*b*) Any other payment or any work the cost of which ought in the opinion of the Electricity Commissioners, to be spread over a term of years (including the payment of interest on money borrowed for capital expenditure for the period during which the expenditure remains unremunerative);

(*c*) The provision of working capital;

(*d*) Any other purpose authorised.

Any money borrowed under this section, and the interest thereon, may be charged on the undertaking and all the revenues of the Board, and must be repaid within such period not exceeding sixty years as the Electricity Commissioners may determine. The maximum amount which may be borrowed by the Board under this section is thirty-three and a half million pounds.

It will be lawful for any annual provision for the repayment of borrowed money to be suspended whilst the expenditure out of such moneys remains unremunerative, but such suspension must not be for a longer period than five years.

The Board may issue stock (to be called "Central electricity stock"). All such stock, and interest thereon, will be charged on the undertaking, and on all the revenues of the Board.

The Treasury may guarantee the payment of the interest and/or principal of any loan proposed to be raised by the Board, not exceeding thirty-three and a half million pounds. Such sums as may be required by the Treasury for fulfilling any guarantees given under this section will be charged on and issued out of the Consolidated Fund of the United Kingdom or the growing produce thereof. The repayment to the Treasury of any sums so issued, with interest thereon, will be a charge on the undertaking and all the revenues of the Board.

The Board is to prepare an annual statement of accounts, which is to be audited by auditors appointed by the Minister of Transport, and must be published.

Miscellaneous Provisions.

On a power company commencing to receive a supply of electricity from the Board, the Minister of Transport may revise the maximum prices authorised under the special Act of the company to be charged by the company for supplies, other than supplies in bulk to authorised undertakers, and may revise the standard prices fixed by such Act, and on such revision regard is to be had to the benefit to the company of any reduction in the cost of electricity due to this Act.

Where a special Act authorises such a company to make good any deficiency in previous dividends, the Commissioners may, after such inquiry as they think fit, by special order make provision for the repeal or limitation of any such authorisation.

Where any company, being an authorised undertaker and not being a power company, receives a supply of electricity from the Board, the Commissioners may by a special order make provision as to the relation between the charges to be made for electricity, and the dividends to be paid by the company. The provisions of this section are not to apply to any London company.

Where any tree interferes with the working of any electric line owned by authorised undertakers, the latter may give notice to the owner or occupier of the land on which the tree is growing, requiring the tree to be lopped. If objection is raised, the Minister of Transport, after giving the parties an opportunity of being heard, may make an order in that behalf, and determine whether compensation is to be paid.

Amendments of the Electricity Supply Acts.

Section 5 of the Electricity (Supply) Act, 1919, is replaced by a new Section regarding the constitution of electricity districts and the organisation of supply; and provision is made for the execution of works by joint electricity authorities, and for the delegation of powers to committees.

The power under section seven of the Electricity (Supply) Act, 1919, is to include power to constitute a joint electricity authority in any case where the original order did not do so.

Where, after the commencement of this Act, a special order is made authorising a company to supply electricity, and the area of supply includes the districts of two or more local authorities, the purchasing authority may after fifty years, or such shorter period as may be specified, and after every subsequent period of ten years or less, require the company to sell its undertaking upon the payment of the capital expended, less depreciation. The Minister of Transport will determine any questions which may arise in relation to such purchase.

The purchasing authority, where the area of supply is situate wholly or mainly within the district of a joint electricity authority, will be the joint electricity authority; or in any other case, the local authorities, acting through a joint committee or joint board.

The special order in any case to which this section applies may make provision as to the relation between the price charged for electricity and the dividends paid by the company.

Where a company, being an authorised undertaker, has ceased to generate electricity, and is taking a supply of electricity in bulk, and the undertaking is purchased by a local authority the purchase price is to include a sum representing the capital properly expended upon plant and other assets rendered unsuitable for use by reason of the taking of such bulk supply, less depreciation. Any question arising under this provision is to be determined by the Electricity Commissioners, whose decision will be final.

The charge made by authorised undertakers to any ordinary consumer, may, if duly authorised, consist of a periodical fixed or service charge, and a charge for the actual quantity of energy or electricity supplied to the consumer. The fixed charge may include rent in respect of any meter, lines, and appliances provided by the undertakers on the premises of the consumer, whether let on hire or hire-purchase terms or otherwise. A method of charge as aforesaid may be authorised by Special Order or by an approval under the Electric Lighting (Clauses) Act, 1899, or corresponding provision, and an option to ordinary consumers to be charged by an alternative method may be authorised.

The Schedule to the Electric Lighting (Clauses) Act, 1899, is to have effect subject to amendments specified in the Fifth Schedule to this Act. Minor amendments are specified in the Sixth Schedule to the provisions of the Electricity (Supply) Acts, 1882 to 1922.

For the purposes of this Act the expression "authorised undertakers" includes a joint electricity authority.

Schedules.

Seven Schedules are appended to the Bill. The first contains provisions as to the acquisition of generating stations and main transmission lines; matters in dispute are to be determined by an arbitrator appointed by the Minister of Transport.

The second Schedule gives rules for determining the cost of production of electricity at selected stations, and the third relates to authorised charges and allowances in respect of transmission lines used for giving bulk supplies to authorised undertakers.

The fourth Schedule adapts Section 16 of the Electricity (Supply) Act, 1919, as amended by Section 21 of the Electricity (Supply) Act, 1922, in respect of compensation to employés at generating stations closed or acquired by the Board.

The fifth Schedule amends the Schedule to the Electric Lighting (Clauses) Act, 1899, with regard to the disposal of the net surplus remaining in any year, and provides that the amount which may be carried to the credit of the local rate in any year shall not exceed one-and-a-half per cent. of the outstanding debt of the undertaking.

The sixth Schedule contains minor amendments of the Electricity (Supply) Acts, 1882-1922, and the seventh gives rules for determining the fixed charges component, and the running charges component.

The number of kilowatts of maximum demand is to be deemed to be twice the largest number of units of electricity supplied from the generating station during any consecutive thirty minutes in the year of account.

The West Midlands Electricity District.

The First Meeting of the Joint Electricity Authority.

The establishment of the West Midlands Electricity District has been accomplished by the Electricity Commission, which summoned the first meeting of the Joint Electricity Authority for the area at Wolverhampton on March 10th.

The constituent bodies are represented on the J.E.A. in the following order: The municipal corporations of Lichfield and Shrewsbury, one member each; Walsall, two members; West Bromwich, two members; Wolverhampton, four members; the urban district council of Cannock, one member; Midland Electric Corporation for Power Distribution, Ltd., five members; the L.M. & S. and Great Western Railway Companies, one each. Other company undertakers (Cannock Chase Colliery Co., Ltd.), one member; the workers in the industry and colliery owners in the district, one each, while three other corporations, 21 urban and 13 rural district councils, are represented by two members.

Speaking at the first meeting of the J.E.A., Sir Harry Haward, an Electricity Commissioner, was confident that the J.E.A. would be able to co-operate successfully with the Central Electricity Board that was proposed by the Government. The district with the electrical development of which it was charged extended from Birmingham to the Welsh border, with an average width of some twenty miles; its area of 930 sq. miles contained 860,000 people, or 924 to the sq. mile. The electricity sold in 1925 amounted to 119,000,000 kWh, or 138 kWh per head of population. Calculations of Lord Weir's Committee were based on an average output of 500 kWh per head for Great Britain in or about 1940.

Potentialities of electrical development in such a district as that were great. The curve of maximum demand took for granted expansion in the immediate future, the aggregate maximum demand in 1930 being estimated at upwards of 90,000 kilowatts, as compared with 60,750 kW last year, or a 50 per cent. increase in five years.

The Committee's report indicated the nature of the work that lay immediately before it, which comprised: Taking over the control and operation of the generating stations and main transmitting lines belonging to four municipalities (Wolverhampton, Shrewsbury, West Bromwich, and Walsall), and of the Midland Co., with consequential reorganisation and necessary extensions of those stations; the construction of linking-up transmission lines and preparation of detailed plans for a new large generating station at Ironbridge with main transmission lines connecting it with the centres of demand of the district.

The District Orders and Acts of Parliament under which the J.E.A. would function, armed it with all the necessary financial and executive powers, subject to the consent, or approval, of the Commissioners. Generally the Order followed the usual form.

Sir Harry proceeded to refer specially to section No. 12, providing for the transfer of generating stations and main transmission lines, and to the significance of the fact that the terms of transfer had already been agreed. That was, perhaps, the outstanding example of the spirit of co-operation and goodwill which had so clearly manifested itself throughout the course of events in that district.

Sections 16 and 17 were important in that they gave effect to an essential feature of the technical scheme—the exclusion from the district of the area of supply of the Shropshire, Worcestershire, and Staffordshire Electric Power Co. The Joint Authority was thus left with the sole responsibility for the supply of electricity throughout the whole district outside the areas of the authorised distributors. Financial clauses dealt with the borrowing of money up to a maximum amount of £5,000,000, but before putting in hand important works, the J.E.A. would naturally desire to be reasonably assured that such works would not conflict with, or be rendered unnecessary by, the Central Board's scheme when prepared and approved.

Sir Harry did not think it need have any hesitation on that score, and said the Commissioners would be prepared to assist it with advice from time to time as regarded each specific work; and the J.E.A. might take it that they, in giving their consent to any such works, would be guided by their knowledge of the probable working out of the general scheme.

Councillor J. Bell (West Bromwich) was elected the first chairman of the Joint Authority and Mr. G. R. J. Parkinson (chief engineer, Midland Electric Corporation for Power Distribution, Ltd.), vice-chairman, Mr. S. Topwith (Cannock Chase Colliery Co., Ltd.) having withdrawn from nomination. The Town Clerk of Wolverhampton (Mr. F. E. Warbreck Howell) was appointed temporary clerk to the Authority.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

Induced Current Cooking.

We witnessed recently a demonstration of cooking on new apparatus about to be introduced by the Falkirk Iron Co., Ltd., at its London showrooms, Craven House, Kingsway. The principle employed is that of the ordinary commercial transformer, the secondary winding actually being, in the case of boiling and frying operations, the cooking receptacle, which is constructed as a one-turn coil, carrying a very heavy current at a very low potential (1.25 V). For roasting, the joint forms part of the secondary circuit, special flexible contacts being provided for the inlet and outlet at the top and bottom of the joint. We reserve our comments on the constructional details of the apparatus until a later date, when we hope to be able to illustrate and describe the system. Some excellent cooking results were obtained; a quart of milk was brought to the boil from cold in 2 min. 10 sec., at a loading of 3,700 watts, at which load two quarts of water were boiled in 4 min.

A "Magnetic" Tee Square.

A new tee square, the Axene, introduced by Messrs. Axene, Ltd., Maxwell House, Arundel Street, London, W.C.2, should prove a valuable addition to the drawing office. This drawing instrument is similar to the ordinary tee square, except that in place of the usual ebony edge at the head it is provided with a special stainless steel magnetic edge. It is intended for use with a drawing board fitted with a steel edge at the appropriate side, so that the tee square is held in position by virtue of the magnetism. It is claimed that the instrument slides smoothly when desired, and yet permits the use of set squares without the necessity of holding the tee square.

A Small Generating Plant.

The accompanying illustration, fig. 1, is of a 120-W, 12-V generating set, a production of Messrs. Stuart Turner, Ltd., 43-47, Market Place, Henley-on-Thames, which was originally designed for the Post Office telephone service for use in automatic exchanges in which over 150 of the sets are already installed. It should prove a suitable set for cottage or bungalow and yacht-lighting installations, and also for charging batteries for wireless and automobiles. The dynamo is of standard make and runs at 1,300 r.p.m.; it is used as a motor, driven from the battery, for starting the engine. This is a ½-b.h.p. machine,

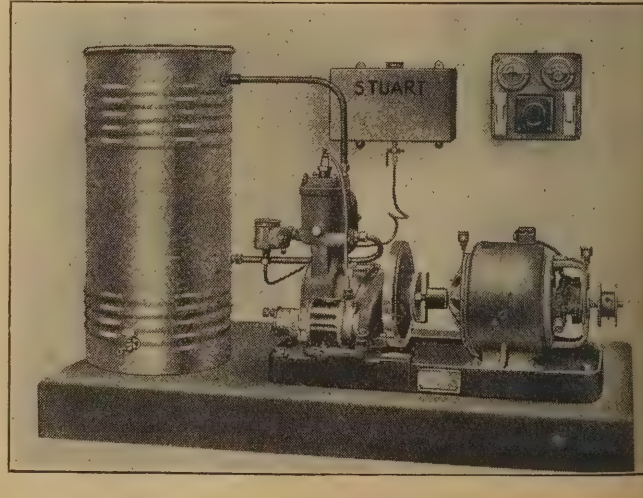

Fig. 1.—Small Generating Set.

designed for running on petrol, benzol or gas, and being completely enclosed, it is claimed to be gas-tight and clean; it is also claimed to be silent and very free from vibration, due to perfect balancing. The fuel consumption, petrol, is said to be a gallon for 10 to 12 hours' running. Starting is effected by means of a push-button on the switchboard, with the battery connected, a touch on the flywheel only being necessary to

help the engine over compression. Starting may also be done by means of a strap wound on the pulley at the end of the dynamo. The battery is of 50-Ah capacity; the cells are of glass with sealed lids and contained in a hardwood crate. The plant is provided complete with petrol and water tanks and the necessary pipes and foundation bolts.

An Improved Electric Cooker.

We have received from the Hotpoint Electric Appliance Co., Ltd., 24, Newman Street, W.1, particulars of a new "Hotpoint-Falco," fig. 2, cooker (No. 5279-A). This is suitable for a household of 4-6 persons, and the hobplate carries two of the new "quick-service" boiling plates. These plates, the former of which is square, have the elements laid in troughs of circular design, and the elements are held in position by small lugs. The plate is of the semi-enclosed pattern, and is supplied with a grid cover which has a circular hole in the centre, exposing the coils when on medium heat, thereby giving a greater efficiency when a small utensil is being used. The plate is there-

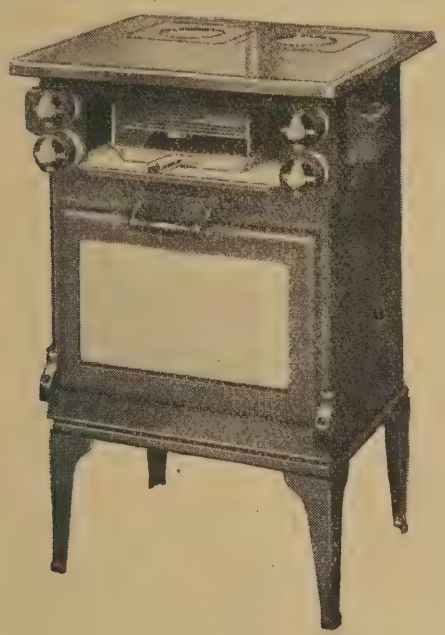

Fig. 2.—"Hotpoint-Falco" Cooker.

fore enamelled on the underside to prevent flaking and rusting at that part, and it is made to be interchangeable with the company's existing boiling rings, and is fitted with a 3-pin plug-in connection. The spirals are of circular pattern and the former is in one piece. Ample provision is made for carrying away spilt liquids, &c., which are carried right through on to the crown plate of the oven, and this is easily cleaned. The two boiling rings and the separate grill are all controlled by separate 3-heat pointer-type reciprocating switches. It is not necessary to lift the hobplate to remove the boiling plates; they can be lifted and withdrawn without disturbing the cooker in any way, and it is therefore easy to replace them. The cooker has been adopted by a number of supply authorities.

An Electrically-Heated Food Trolley.

Among the many devices which afford the use of electricity for novel purposes is an electrically-heated food trolley, fig. 3, designed for hospital use, which is marketed by the Dowsing Radiant Heat Co., Ltd., 91-93, Baker Street, London, W.1. It is a well made oak hot-cupboard with outside hinged doors on

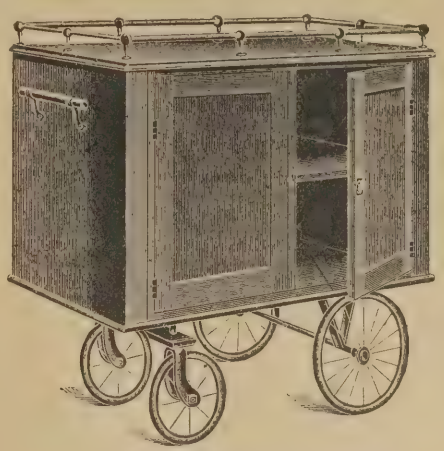

Fig. 3.—Electrically-Heated Food Trolley.

one side, and a brass rail round the top. The interior is lined with asbestos, and suitable heating elements, with 3-heat regulation, are contained in the base. The whole is mounted on rubber-tired cycle-pattern wheels, 12 in. and 7 in. in diameter. The overall dimensions are 3 ft. 9 in. long, 2 ft. 1 in. wide, and 3 ft. 6 in. high. The loading is 1,000 W.

An Improved Flexible Cord.

We have received from Messrs. Ward & Goldstone, Frederick Road, Pendleton, Manchester, two samples of their most recent production, Negrolac flexible cord. It is intended to replace the usual workshop flexible cord, on which the wax compound with which the braiding is treated tends, in warm atmospheres or immediately above the lampholder, to soften. "Negrolac" is treated, under a special process, several times with a flexible oil and acid-resisting varnish, which, it is claimed, will not soften under the conditions named. The result is a smooth and bright appearance. The new product is made in two grades, one for pendant use, 23/36, in which the twin conductors, prepared to the I.E.E. rules, are coated directly with the "Negrolac" finish; in the other type, anti-shock, the insulated conductors are embedded in a soft flexible rubber over which is the "Negrolac"-treated braid.

Electro-Farming.

The Applications of Electricity to Agriculture.

The meeting of the Institution of Electrical Engineers on March 4th, when a paper on the above subject (an abstract of which will be found in our issue of March 12th) was presented, was well attended.

Mr. R. Borlase Matthews, M.I.E.E., the author, taking his paper as read, showed a large number of lantern slides and two kinematograph films to illustrate methods of electric ploughing, the application of electric power and lighting on the farm, and agricultural processes. He also exhibited a selection of plants and bulbs in bloom and seedlings which demonstrated the influence which electric lighting had on their growth.

Discussion in London.

Sir A. Daniel Hall, F.R.S., opened the discussion by remarking that they would need all the author's enthusiasm before they would reap much fruit. It was necessary to distinguish between the use of electricity on farms in this country and in Europe; on the one hand, its application to domestic purposes and small power by means of portable motors was normal on the Continent, and would be here also if they could have similar facilities for distributing electricity; however, that would only mean a small load. On the other hand, what prospect was there of inducing the farmer to change his methods of ploughing and of performing his major operations? They must beware of taking too rosy a view of the economy that would result from the adoption of electrical methods in such cases as those. Every farmer must use horses for cartage and odd jobs; that was a big operation, and the horses had to be kept employed when they would otherwise be idle. Steam ploughs had been available for many years, but they had not displaced horses; in fact, their use was decreasing rather than increasing, which facts indicated the need for a practical type of tractor. Following a reference to costing on a well-organised farm, Sir Daniel said that they were not yet certain about the positive results that were declared to result from the stimulation of plant growth by means of ultra-violet light, mercury-vapour lamps, electric discharge over crops, &c., and that, therefore, they could not begin to calculate the economics of the subject until they were definitely positive. Farmers did not care how they got their power so long as it was cheap and enabled them to carry out their operations economically. They were continually gambling with the weather, and therefore must move slowly and necessarily be conservative because they had no spare cash for experiments. Farmers had enough to do already, and accordingly it was the engineer who must do the pioneering. The farmer would have to be dealt with simply and directly, for he could not afford to adopt new methods until he was sure of them.

Mr. Ll. B. Atkinson, pointing out that the engineer and farmer were largely ignorant of each other's point of view, said it was easy enough to get the farmer to use electricity when it was available. The real problem was how to take the supply into rural areas, and in that connection he agreed with the author's contention that statistics should be dealt with on a basis of route miles and not area supplied. For use in this country a smaller pattern of plough was more

suitable, but the plough was the wrong type of implement (except for horse haulage) and for high-speed work a lighter machine would be needed. The author had done a definite service in working out a concrete example of a transmission and distribution system. A large-scale experiment was needed now, but the farmer could not be expected to undertake it; he would have to be loaned the apparatus and equipment with an option to purchase it later. He agreed that if portable lamps, &c., were to be used, they must be properly specified in order to avoid accidents. He had found that, while the lighter kinds of poultry did continue to feed for longer periods under the influence of artificial light, the heavier breeds apparently took no notice of it, and went to sleep at the usual time soon after sunset; being heavier birds, they probably could eat more in less time. Although he did not question the stimulating effect of artificial light on plants, he pointed out the fact that all plants naturally grew more at night than in the day-time.

Mr. B. M. Jenkin explained that he used to be an engineer, but he commenced farming about 12 years ago. The author's conception of the total consumption of electricity if all farms in this country used it was too high, as his "57 million acres" included forests and other areas unfit for cultivation. He could not think that electric haulage was being used on any farm. The farmer's first object was to avoid useless expenditure. Were fixtures to be provided by the owner or the tenant? The farmer dare not put capital into fixtures when he might have to turn some of his land over to grass in a few years' time. The electric plough could not compete with the tractor, but rotary tillers involved a fundamental difference. More efficient means of driving the machines direct were required to take the place of the older horse-drawn implements which were provided with wheels that used the earth as a transmission belt.

Mr. W. Fennell said the reason why more extensive use of electricity was made on the Continent was that electrical engineers in Europe were allowed to take their mains to the farmers with less hindrance and less stringent regulations than those encountered in England. His experience was that country people wanted electric light and would use it if they could get it; a modified form of "fringe order" was wanted, and an area extension order should be obtainable by specifying the area to be supplied instead of the individual. Increased facilities for running overhead lines were needed, and he appealed to those who had influence to help engineers to obtain that sort of assistance.

Mr. R. B. Matthews, in reply to some of the points raised, pointed out that on his 640-acre farm he had two horses only, and they were not overworked, which fact showed that there were openings for mechanical operations. In America, where the artificial illumination of poultry houses was universal, it was found that the egg production from the heavier breeds of chickens was better than that of the lighter sort. Although ploughing was the traditional method of giving the farmer what he thought he needed, was it really the right operation that was wanted? In the past, farmers had been exploited somewhat by engineers, and they were consequently now diffident about the adoption of new methods.

The president, Mr. R. A. Chattock, then adjourned the meeting.

The discussion was resumed on March 11th, when Col. K. Edgcumbe presided.

Mr. Montague Fordham, who has nearly completed a tour of some of the rural districts of the country, giving a course of about 300 lectures on rural construction, said it was felt in the places which he had visited that the future progress of the country districts depended on the use of electricity. As a reply to Sir A. Daniel Hall's remarks, he recommended the reading of Lady Hall's book, which dealt with rural reconstruction with special reference to electricity. The tendency of the people of the rural districts to leave for the towns would destroy civilisation, and electricity was essential to reverse the process. He found the farmers keenly interested in the use of electricity for agricultural processes, particularly in connection with hay drying.

Mr. F. H. Clough said the difficulties in providing transmission lines were largely political. A serious item was the cost of switchgear for tapping the lines; at 3,000 V a cheap and simple equipment could be provided for loads up to 15 kVA. He recommended the laying of single-phase lines at first, to be followed when the load developed by 3-phase transmission, and suggested that it would be a drawback to include the capital charges of the lines with the consumption cost to the consumer; it would be better to charge the user an annual amount to cover the capital costs.

Mr. H. M. Sayers referred to the question of lighting the hen-runs; he had recently carried out some experiments in this direction and had obtained an average of 3.27 eggs per hen during a period in the winter months. It was important to continue the lighting; after a cessation of only three days the egg production dropped from 130 to 90. He suggested that the heat absorbed by the condensing water in the generating station should be used for warming the soil used for agriculture. To do this a network of pipes carrying the warm water could be laid at a given depth and pitch in the ground. He estimated that a 10 deg. F. rise in the temperature of an acre of land would be equivalent to a 1,000-kW load. Besides warming the land it would defeat the spring frosts. This scheme would enable the market gardener to grow crops the whole year round; to hasten the growth, if slow, intensive lighting could be used.

Mr. E. B. Wedmore criticised the method employed by Mr. Matthews of heating beehives. The proper method was to supply heat at the centre of the cluster. The bee itself, in its natural surroundings, consumed the honey from the centre of the hive and converted it into heat energy. His Association would welcome from Mr. Matthews any proposals for research on the question of the utilisation of electricity on the farm.

Col. R. E. Crompton referred to the proposed National Electricity Scheme; he thought the Prime Minister, when speaking of the saving to be brought about by the proposals, must have meant a saving as regarded agriculture. The industrial world was well served and not much could be saved by cheapening the supply. The young electrical engineer must address himself to the question of electricity supply to the rural areas and so reverse the process of the draining of the population into the towns. Only a large demand and even distribution could make a general rural supply possible. Electricity for lighting should be very cheap to encourage its use for power and other services, and this policy had been adopted in the districts around Milan, in the South of France, and recently in Germany. He would welcome any information as to the results of the production of nitrogen or nitrates in Germany. Some development of the hysteresis control referred to in the paper would probably result in a considerable advance in cultivation by means of electrical energy. He was afraid that the use of electricity on the farm would offer no advantage in diversity of load. He thought Mr. Sayers's scheme very attractive, but he did not see how it would be practicable when the generating station was 50 miles away from the land; if anything, the argument was in favour of the small station.

Major T. Rich paid a tribute to Col. Crompton; such energy and enthusiasm as were shown by the Colonel in the early days of electricity supply were wanted now to deal with the question of supplying the rural districts. In particular they wanted facilities for distribution. In France, where there were many thousands of miles of distribution lines, a committee of business men advised the Government on the question of transmission lines, and great facilities existed. The rural authorities had full powers to deal with the schemes, but they were not foolish enough to retard progress; they got something out of the schemes, as a small fee was paid to them. It was not the practice in France to employ 220 V on the farms; the general pressures used were from 90 to 110 V. In the north of that country 15,000 V was employed for general distribution and it was found that transmission at pressures above 3,000 V did not cost a great deal more. At Bethune 15,000 V was used on iron-wire lines. At the Grenoble exhibition last year a feature was double-stepping transformers for secondary pressures of 660 V and 110 V. He had noticed among the exhibits that the portable motors appeared to be no different to ordinary industrial motors. Developments were also shown in portable transformer stations. During the war the industries in Paris were encouraged by the electrical transmission schemes to move into the rural areas. It was regrettable that in this country they had to pay more for electric lamps than the people in any other country; they ought to be able to get lamps at 1s. or less each. A cheap lamp would do more to encourage the use of electricity than all Government stunts.

Mr. W. J. Minton, in referring to some of the suggested methods for electric ploughing, said it must be remembered that the object of ploughing was two-fold, to turn over the ground and also to bury the weeds. Snatch crops were very desirable to the farmer and in this direction electricity would be a great help. He asked if Mr. Matthews had had any experience in the laying of tramlines over the farm, and also if he advocated the use of single overhead conductors with earth returns. No mention, he said, was made in the paper of the comfort of the farm labourer. If the farm hand was given a few lights in his own dwelling, he would soon be as enthusiastic about the use of electricity as the farmer. He did not agree that the farm labourer was not capable of the ordinary management of machinery; he knew of cases where the labourer took down the tractors and decarbonised them when necessary.

Mr. W. A. Turnbull said that due to the influence of Mr. Matthews, the Aylesbury Council had just placed the necessary order for the electrification of the district. The scheme provided for overhead lines at 11,000 V and the cost was £600 per mile. At that pressure tapping off at any farm could be done with cheap apparatus; it would be difficult to do so at a pressure of 20,000 V. The main lines were to be of 0.075 sq. in. copper and the branch lines of steel wires. As the load developed the copper would be taken down and replaced by aluminium of double the capacity. The cost of the steel line was half that of the copper one. In order to overcome the injurious effects of the ammonia in the cow sheds to the wiring, he was advising the use of ordinary v.i.r. cables run on cleats.

Mr. R. H. White suggested that consideration should be given to the generation of electrical energy for the country districts by wind-driven generators, which were being used to some extent in Germany.

Mr. A. H. Allen emphasised the necessity of cheapening the cost of distribution and of providing facilities for obtaining wayleaves for running overhead lines. The present difficulties experienced in obtaining the necessary wayleaves were a great drawback to progress in electrical distribution in the country areas. Every endeavour should be made to simplify the construction of overhead transmission lines. He felt that the elaborate devices which resulted from the present regulations

were undesirable. Quite recently a case had been reported where the protecting cradle of an overhead wire had been blown about in a gale and had knocked down the live wire itself, resulting in the death of a schoolboy who handled the wire. That was much worse than no protection at all. Many miles of overhead trolley wire were in use in the towns and very little trouble indeed was experienced with them.

Mr. A. E. Jackson criticised the proposal to utilise the condensing water for warming the land on the ground that the heat would be required at night when the station load would be smallest. Referring to the cost of running out transmission lines, he quoted a case where the costs were only £180 per mile. This was effected by the use of a special reinforced concrete pole.

Mr. J. S. Francis said that in Bavaria the rural supply companies did not care to undertake the distribution work and this was taken on by farmers' associations.

Mr. F. Creedy asked for information as to what kind of electrical energy was used on the farm referred to in the paper. He had noticed that the frames of the motors shown on the slides were of the d.c. type. Although polyphase motors were preferable to motors of other types, single-phase transmission held many advantages over 3-phase.

In reply to a number of the points raised, Mr. Matthews said he welcomed the offer of Mr. Wedmore's association, and he would think it over. Referring to the question as to the production of nitrates he said that large quantities produced in Norway were sold to the farmers in this country. Electric ploughs should be considered as of two classes, the commercial type of to-day, worked on the same lines as the steam plough, and the prospective types embodying great improvements. The load and diversity factors of the farm were quite good, there being about 20 different branches in which the energy was used. Except for ploughing he was in favour of using no bigger motor than 5 h.p.; thrashing was a convenient odd-job load. In the Netherlands a steady load of 500 kW was taken by farms for thrashing. The ordinary industrial motor was used for agricultural purposes in France, but that country was farther behind than other countries in the production of agricultural types. As to the decrease in the number of steam ploughs in use in this country, that was due only to large areas of arable land having been turned to grass. The " powers that be " had an open mind on the question of overhead construction and would give careful consideration to any proposal that was put forward; many people were attempting to design lines in an amateur way. Continuity of supply in the rural areas was not of vital importance and the farmers generally were willing to put up with a greater voltage variation than the present regulations permitted. He thought it was a good practice to commence transmission schemes with steel wires and change over to copper lines when the load became profitable. By providing the farmer with the insulators and wires and letting him erect the lines, the capital outlay could be reduced to £25 per mile of line; there were more farmers capable of erecting lines than there were linesmen. It was not generally known that there were in existence two associations with official backing which would assist in schemes for rural construction. The Land Advance Corporation would advance loans for improvement schemes, including the introduction of electricity. The motors shown on the screen were a.c. motors with d.c.-type frames. Three-phase distribution seemed to be at present the most desirable method, but the transmission costs could be reduced considerably by redesigning apparatus for single-phase energy. A comparison between the night growths of two groups of plants in the same house with the same heat, but with different light, showed that the plants provided with intensified light made twice the progress of the others. The question of the price of electric lamps in this country had already been put before the Electric Lamp Manufacturers' Association. The Ministry of Agriculture and the School of Engineering at Oxford had recently completed some tests at Harpenden on windmills, and it was found that by using air-screw designed wings, as used for aeroplanes, the efficiency could be increased by 106 per cent. The use of the single wire with an earth return was receiving consideration in some quarters, and the system advocated by Mr. Seabrook would enable underground cables to be laid as cheaply as overhead lines at present. Electricity would prove a great help in inducing the people to get back to the land, but it must be remembered that electricity alone would not do it.

Legal.

Collins v. Southern Counties Electric Light and Power Supply, Ltd.

Mr. Justice Lawrence, in the Chancery Division on March 12th, had before him this action against the Southern Counties Electric Light & Power Supply, Ltd., of Bournemouth, for judgment in default of defence.

Mr. Hecksher, for the plaintiff, said that the action was for the rescission of a contract to take debentures on the ground of misrepresentation, but on that day a defence had been delivered. In the circumstances, therefore, he could not ask for judgment on this application.

His Lordship said that the defence could not be disregarded, and he made no order.

Loughborough Corporation Summoned.

Arising out of a recent fatality at the Empress Works, Loughborough, when a man named Arthur Hubbard was killed, the Loughborough Corporation was summoned at the local Police Court on March 11th. Two summonses, alleging that regulations had been neglected by leaving the terminal of a high-pressure cable insufficiently protected, were dismissed. A fine of £2 was imposed on a third summons, alleging that the Corporation had allowed an unauthorised person without proper supervision to undertake work where technical knowledge was necessary to avoid danger. On a fourth summons, for having failed to maintain in safe condition certain electrical appliances, a fine of £10 was imposed. Hubbard was engaged to repair the floor outside a cubicle, and being unaware of the danger, he put his head inside the cubicle and came into contact with a cable carrying energy at 6,400 V and was killed.

British Thomson-Houston Co., Ltd., v. The Novelty Co.

Mr. Justice Lawrence, in the Chancery Division on March 12th, granted an injunction on the *ex parte* application of the British Thomson-Houston Co., Ltd., restraining a company called the Novelty Company, of Grays Inn Road, W.C., from infringing the plaintiffs' patent for the gasfilled lamp.

Mr. Trevor Watson, for the plaintiff company, asked that the defendants should also be restrained from parting with the infringing articles.

His Lordship assented.

Leicester Corporation Fined.

The Leicester Corporation was fined £100 at the Leicester Police Court on March 11th, for negligence at the Freeman's Meadow power station as a result of which Andrew Wallace Minto was killed on January 27th. It was agreed that after deduction of the expenses of the prosecution, the balance should go to the relatives of the dead man. Minto was working a portable electric drill, which had no earthing wire attached to it, and he received a fatal electric shock. The Corporation accepted responsibility in law, and the chairman of the bench stated that someone had failed in his duty in not seeing that the regulations respecting the use of such tools were obeyed.

Theft of Motors.

At Old Street on Saturday, Francis Leo Mooney, Upton Park, was charged on remand with stealing and receiving two electric motors, value £6, the property of his employers, the Enterprise Machine Supplies Co., Ltd., Whitechapel. Defendant pleaded guilty, and it was stated that he had borne a good character hitherto and the prosecutors did not desire to press the charge. Mr. Snell bound over defendant for twelve months.

Matton v. Pressland Electric Supplies, Ltd.

This case came before Mr. Justice Russell in the Chancery Division on March 9th, upon a motion by the plaintiff, the sole debenture holder in the company, for judgment against the company in default of appearance. Counsel in support of the application said there had been an issue of £6,000 debentures and the interest was in arrear. Tne minutes were in the usual form. His Lordship granted an order.

B.M.A.S., Ltd.

A petition for the winding up of this company came before Mr. Courthope Wilson, Vice-Chancellor, of the Lancashire Chancery Court, at Liverpool on March 8th. The petition was presented by the Chloride Electrical Storage Co., Ltd., creditor for £759. The defendant company was not represented, and an order for winding up was made.

Galliers v. Milward.

At the Brighton County Court on March 11th, before Judge Cann, Mr. H. J. Galliers, electrical contractor, Worthing, sued Mr. A. Milward and his wife (trading as the Worthing Valet Service) for £56 19s. for work done and materials supplied. It was stated that £10 5s. had been paid into Court.

Mr. R. A. Bull, the plaintiff's Worthing manager, stated that Mr. Milward gave an order for an electrical installation at his shop in Warwick Street, Worthing. As the decoration had been completed and the work was required to be done quickly, witness suggested the use of lead-covered wiring and that was agreed to. The defendant saw the work in progress and made no complaint, and, later, gave instructions for the wiring of the upper part of the premises on the same system. Nor was any complaint received when the account was sent in.

Mr. A. J. Hedgcock (W. T. Henley's Telegraph Works Co., Ltd.), said that the system employed was safe, both electrically and mechanically.

Defendant, giving evidence, said that when he had had other premises wired, Mr. Bull had advised him that steel tubing was the only safe system. He had called attention to the use of lead-covered wiring on the installation in question, and Mr. Bull said that it had been used because it was less unsightly than steel conduit. When he found that lead-covered wiring had been used in the upper part of the premises he asked for it to be removed. Cross-examined, Mr. Milward said that he had had no cause to complain of the installation. He called a witness who, while stating that he considered

that the steel-tubing system was safer, admitted that he had had no experience with lead-covered wiring.

His Honour said that it was perfectly clear that the defendant wished to avoid paying a just debt. The plaintiff would be awarded £46 14s., in addition to the amount paid into Court, with costs on the High Court scale up to the date of remission and subsequently on Scale "C."

Explanation.—Messrs. Fernand Espir, of 68, Coleman Street, E.C.2, ask us to state, in order to avoid misconception among their trade friends, that they have no connection with the defendant in the law case "Bonnella *v.* Espir," reported on page 443 of our last issue.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Kent Coalfield. — On March 8th, Lord Henry Cavendish-Bentinck asked whether, when loans were made to those who were sinking the new coal pits in Kent, conditions were made for preserving as far as possible the amenities of the country side; whether smoke-abatement devices were insisted on at each pithead; and if conditions were laid down as to whether the pits were to be worked by steam or electricity.

Mr. McNeill, Financial Secretary to the Treasury, said that no conditions of the kind indicated were attached to the guarantee which the Treasury had agreed to give to Messrs. Pearson and Dorman, Long, Ltd., but a joint advisory town planning committee was watching the development of the area.

Severn Barrage Scheme.—On March 9th, Mr. Wardlaw-Milne asked the Minister of Transport whether the committee which was to consider the possibility of the Severn barrage scheme would also be instructed to go into the possibilities of smaller power stations by harnessing the stream of the Severn at various points nearer its source in preference to the possible heavy expenditure on a great barrage at the mouth of the river.

Colonel Ashley said that on the recommendation of the Severn Barrage Sub-Committee of the Committee of Civil Research, the Government had decided to carry out certain preliminary investigations. When those had been completed the whole subject, including the points raised in the question, would be further considered.

The Electricity Bill.—On March 10th, the Government's Electricity Bill was introduced by Lt.-Col. Ashley, the Minister of Transport, and read a first time.

Mr. Hardie asked the Prime Minister, in view of the interest manifested in the Electricity (Supply) Bill, whether he would see that ample time was given for discussion even if it should involve some curtailment of the holidays of the House.

Mr. Baldwin said that the Government hoped to secure a second reading of the Bill before Easter in order that the fullest possible time might be available for its discussion during subsequent stages.

Electric Traffic Signs. — On March 11th, Captain Bullock asked the Minister of Transport whether he would consider the advisability of using electric and other signs where there was one-way traffic.

Col. Ashley said that the question of the erection of direction signs, capable of illumination at night, at one-way traffic streets, had been under consideration for some time, and arrangements were now in hand for the erection of such signs in Parliament Square, Long Acre, and elsewhere.

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from the dates mentioned :—

Tonalite (lettering and design). No. 466,202. Class 1. Electrolyte for accumulators.—A. J. A. de la Porte, 80, Schenkkade, The Hague, Holland. (British representatives: J. S. Withers & Spooner, 51-52, Chancery Lane, W.C.2.).

Guarding the Pole (lettering and design). No. 461,834. Class 8. Electric dry cells.—T. H. Poulsson, 43, Dronningensgade, Stavanger, Norway. (British representatives: Phillips', 70, Chancery Lane, W.C.2.)

Vita. No. 460,612. Class 8. Valves for use in radio-telegraphy and telephony.—Peter Curtis, Ltd.

Radiostar. No. 463,899. Class 8. Instruments, apparatus and parts thereof for use in radio-telephony and telegraphy, but not including detector crystals.—Edison Swan Electric Co., Ltd.

Rafex. No. 465,721. Class 8. Electron discharge tubes for radio and wired telegraphy and telephony, X-ray tubes not for medical or surgical purpose, and rectifying tubes.—Mullard Radio Valve Co., Ltd.

Emeer. No. 465,713. All goods in Class 13.—Metropolitan-Vickers Electrical Co., Ltd.

Varlina (lettering and design). No. 463,155. Class 8. Electrical apparatus for display signs or advertisements by means of illuminated or light reflective surfaces.—Harrington & Co., 47, Litherland Road, Bootle.

Becol, No. 466,434, and Becolite, No. 466,434. Class 8. Instruments and apparatus manufactured wholly or partly from ebonite or vulcanite.—British Ebonite Co., Ltd., 25, Nightingale Lane, Hanwell, W.7.

Davon. No. 455,936. Class 11. Electrical appliances for medical and surgical purposes.—F. Davidson & Co., 29, Great Portland Street, W.1.

Stabe-Larc (lettering and design). No. 463,958. Class 18. Electric arc welding plant.—Allen-Liversidge, Ltd.

Maconite. No. 464,448. Class 40. Preparations composed chiefly of india-rubber for insulating electric cables.—The Macintosh Cable Co., Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

19,824. "Electrical amplifying apparatus." J. W. Kirkland. (Allgemeine Elektricitats-Ges.). August 21st, 1924. (247,612.)

24,360. "High-frequency electric discharge tubes and generators for medical purposes." E. V. Hayes-Gratze. October 14th, 1924. (247,623.)

24,704. "Electrical system employing space discharge devices." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). October 17th, 1924. (247,626.)

24,793. "Electric cables." Callender's Cable & Construction Co., Ltd., and S. J. Bryce. October 18th, 1924. (247,627.)

27,490. "Telephone systems." Automatic Electric Co., and C. E. Lomax. November 17th, 1924. (247,647.)

27,491. "Telephone systems." Automatic Electric Co. and J. Wicks. November 17th, 1924. (247,648.)

27,557. "Control of the effect of fluid currents on the stream-line surfaces of prime movers." Aero-Dynamos, Ltd. (Ventimotor Akt. Ges.). November 18th, 1294. (247,650.)

27,893. "Electrical measuring instruments." Crompton & Co., Ltd., W. F. Jones, and W. G. Smith. November 21st, 1924. (Addition to 233,808.) (247,663.)

27,918. "Electrical control systems." Metropolitan-Vickers Electrical Co., Ltd. November 28th, 1923. (225,542.)

27,931. "Laminated terminals for electric switches and the like." British Thomson-Houston Co., Ltd., H. Trencham, and L. Rigg-Story. November 21st, 1924. (247,665.)

27,936. "Electrical regulating apparatus for alternating current." E. H. Jones. November 21st, 1924. (247,666.)

The Electricity Supply Scheme.

ON Monday or Tuesday next week, if the Prime Minister's intentions are carried out, the Electricity (Supply) Bill will be debated and read the second time, after which it will go to a Standing Committee for that detailed examination which Mr. Baldwin anticipates, and for that drastic amendment which it will undoubtedly receive, processes which will probably occupy many weeks.

As the scheme stands, it will find few supporters amongst those who are conversant with the past and present of the electrical industry. That long-suffering industry has from the first laboured under a superfluity of Parliamentary and bureaucratic control in some respects, whilst in others it has lacked the helping hand which could have done so much to smooth its path and hasten the development of electricity supply. The consequence is that, whilst it still needs the latter as much as ever, it is compelled to invoke the former to repair the damage wrought by past legislation. But the salvation of the industry is not to be brought about either by the waving of weird "gridirons" or by the multiplication of authorities. There are already too many doctors for the health of the industry.

First, let us consider the question of the Central Electricity Board, the fundamental feature of the Bill. Already its constitution and status have been vigorously attacked by prominent representatives of the electrical industry. Col. R. K. Morcom, in his speech at the Beama luncheon on Thursday last week, pointed out that the Board would be in all respects—technically, administratively, and financially—under the control of the Electricity Commission; it would have no independent existence, and he could see no justification for its creation. It could not function effectively unless it were given real executive powers and became a strong industrial board of directors. Last week, too, Sir Philip Dawson, M.P., although he welcomed the Bill as a whole, declared that to make the Board subservient to the Commissioners was fundamentally wrong—it must be free and independent. The technical work should be carried out by the Electricity Commissioners, but the great commercial questions connected with the generation and supply of electricity should be in the decision of the Board, which should be directly responsible, through the Minister of Transport, to Parliament, and should be independent of any political party. Mr.

P. J. Hannon, M.P., whose remarks at the dinner of the Birmingham Electric Club were quoted in our last issue (p. 452), was interviewed by the *Financial News*; he again emphatically condemned the proposal to make the Board "an appendage to the Electricity Commissioners," and asked whether the Board was necessary at all. Why not enlarge the powers of the Electricity Commissioners, and make them "the supreme determinant factor in the development of electrical distribution?" Apart from occasional reference to the Minister of Transport, "the whole of the effective power remains in the hands of the Electricity Commissioners." In Mr. Hannon's opinion, whilst no one would object to the endowment of the present Commissioners with the powers embodied in the Bill, "Commissioners come and go, and Governments may change," and he regarded it as essential that such a body should be subject to Parliamentary control.

With the spirit of these criticisms we cordially agree. The new Board, Mr. Baldwin stated at Birmingham, was to consist of men of the highest industrial standing, fully conversant with the conditions obtaining. Such qualifications will undoubtedly be required—but is it to be supposed for a moment that men who possess them will accept office as underlings? Everything depends upon the working of the scheme, and therefore upon the men who direct its working—men who will not easily be found, and who certainly will demand freedom of judgment compatible with the responsibility of their duties and the importance of the affairs entrusted to them. To subordinate their office to the Electricity Commission is not only to impose double duties upon the latter, but also to shut out every man of character and ability adequate to fulfil the functions of the Board with efficiency and strength.

What, then, are the alternatives? Sir John Snell, in his popular address broadcast from the dinner of the E.D.A., asked for constructive criticism of the Bill, and we give it. There should be but one controlling authority—the Central Electricity Board—responsible to the Minister of Transport, who would answer for it in Parliament. The Electricity Commissioners, whose experience derived from their incessant labours during the past six years constitutes an invaluable asset to the State, should either become an advisory body to the Board, dealing with all technical questions, or should be incorporated with the Board. The latter course would appear to be the more rational and effective, and we hope to see it adopted by Parliament.

Sir Philip Dawson and Mr. Hannon have already tabled a motion instructing the Committee which will deal with the Bill to modify it in that direction, and there is a strong body of opinion in the House of Commons hostile to the Bill in its present form.

The Basis of the Electricity Supply Bill.

It is very much to be regretted that one of the most fundamental data with regard to the present position of electricity supply in this country is, we believe, no more than a shrewd guess. No doubt very many important matters have to be dealt with on no better foundation; no man can tell what the future may bring forth, and we have to do the best we can with estimates in the hope that the outcome will not be found materially in error—but at least we ought to be in possession of the facts as they actually exist. Unfortunately we do not know, and have no means of knowing, the present rate of consumption of electricity *per capita* in Great Britain. In the Report of the Weir Committee, dated May 14th, 1925, the energy sold per head of population by authorised undertakings is set down as 110 kWh; in the fifth annual report of the Electricity Commissioners for the year ending December 31st, 1924, p. 10, the figure is given as 117, on the basis of the Census Return of 1921. This figure, however, does not include the energy used for traction and generated at the power stations of railway and tramway authorities, nor does it include "the further large supplies generated privately at stations belonging to industrial and commercial organisations," of which no statistical returns are available. An approximate value could be obtained for the consumption of energy for traction (say 12 per cent. of the aggregate), but the enormous amount that is generated in private establishments can only be guessed at. In the Weir Report we read (p. 5): "It is estimated that if energy from every source, both public and private, were included, the consumption per head in this country would be raised from 110 units to about 200," but the former figure is adopted in the calculations tabulated by the Committee.

In his evidence before the Coal Commission, Sir John Snell put forward the figure of 117 kWh for 1924, and adding the estimated units generated by private plant, gave the probable total consumption as 220 kWh per head, while he suggested that a *sale* of 500 kWh per head would be reached in the course of the next 15 years, assuming that (para. 4,393) further facilities would be given to the Commissioners and to the electrical industry. Questioned with regard to the consumption at collieries, Sir John said the Electricity Commission had information at its disposal, but that it was given in confidence and could not be disclosed without consent (paras. 4,410 *et seqq.*); but Mr. Evan Williams said he could obtain the figures, and the matter was left at that.

It should, we think, be realised that this is a very important question; nearly half the electrical energy that is believed to be consumed in this country to-day is the subject of guesswork, at a time when that quantity is of fundamental importance to the deliberations of Parliament!

In the Annual Report of the Electricity Commissioners above-mentioned, it is shown (p. 10) that the rate of increase of energy *sold* from 1922 to 1923 was 19 per cent.; and from 1923 to 1924 it was 15 per cent. The figures given for energy *generated* for public supply and traction (p. 8) show annual increases from 1922 to 1925 of 17.5, 16.4, and 11.0 per cent. The Weir Committee said (p. 6) that "on the basis of the present increase of 19 per cent. per annum, the demand in Great Britain will have reached 500 units per head of population by about 1940," starting from 110. But if we increase the consumption annually by 19 per cent., from January, 1925, we arrive at 500 kWh per head in 1933, nine years from that date. Yet the Committee places that consummation at about 1940! This estimate of increase, it will be noted, is based solely upon energy *sold*, and takes no account of any possible increase in privately-generated energy, or in the consumption for traction; and it is based on progress that is being made under the existing conditions. If, then, we shall presumably reach the 500-unit mark in eight years from to-day, why did Sir John Snell suggest, in the evidence which he gave on November 11th, 1925, that the consumption of electricity per head would be trebled in 15 years only on the assumption that "further facilities" or "further powers" were given?

These figures are irreconcilable, and it would be very helpful if a coherent statement were issued by the Electricity Commissioners as to what they mean by the rate of increase, and what steps have been or are being taken to ascertain what the actual consumption of electricity (not merely the energy sold) in this country is to-day. The Census of Production, which is in course of compilation, ought to furnish ample data for the purpose—provided that the authorities consider it expedient to disclose the facts.

Another statement of which much has been made is that the amount of spare plant installed in the generating stations of authorised undertakings in this country is 68 per cent. At first sight this appears to mean two-thirds of the plant installed; it is, however, only 40 per cent. of the plant installed. The Weir Committee states (p. 4) that the plant installed is 3,096,535 kW, and the maximum load is 1,844,000 kW (May, 1925), the spare plant therefore being 68 per cent. of the *maximum load*. This is a very different matter. Speakers on this subject who have stated that 68 per cent. of the plant was

spare should have said 40 per cent., which, if admittedly excessive, is by no means so startling a figure.

The last column of the table on p. 25 of the Weir report is similarly misleading, an increase from 110 to 500, for example, being described as a growth of 455 per cent. instead of 355.

Colonel Morcom's Speech.

The annual speech of Col. R. K. Morcom, the chairman of the British Electrical and Allied Manufacturers' Association, which is printed in full on a later page, was one of the most compact and businesslike reviews of the electrical industry to which it has been our privilege to listen. In the main we may leave it to speak for itself, but there are one or two points to which special attention should be directed. The figures of our electrical export trade reflect a very satisfactory state of things. The Colonies and Dominions are enjoying such a measure of prosperity as to permit them to proceed with schemes for the development of their resources, and British electrical and allied industries have been profiting from that state of things. Happily there is in the Colonies and Dominions a spirit of patriotism which inclines them to avoid the temptation to place their contracts outside the Empire family circle. It is unfortunate that the same state of things is too frequently less noticeable at Home. If there had not been a lag upon our great industries these would have been able to proceed with greater developments of our internal resources which would have brought bigger business to our electrical and allied trades from the Home market. The Home trade would then have compared far more favourably with the export business. But apart from the delays in our internal industrial progress, due to a variety of circumstances—among them threatened industrial disputes and anticipated electrical legislation, both occasioning doubt and uncertainty—there has been the placing of orders abroad by Home authorities and buyers. The total of the electrical import trade of the United Kingdom was too high, and Colonel Morcom indicated that if there had been everywhere present amongst buyers in the Home country that same patriotic spirit which possesses our kith and kin beyond the seas, we should have retained sufficient additional orders to secure the filling of our works to their utmost capacity with benefit to our manufacturing concerns and more employment in the nation. It is calculated that the volume of the import electrical business recorded in the statistics quoted would have sufficed to give employment to 15,000 more workpeople in the electrical industry alone, and a further similar number in other trades, if the orders had been kept at home. Another point, stressed now as it was a year ago, is the menace of future German and American competition. The assistance rendered to Germany in the shape of financial aid for industrial and electrical developments is, as we have frequently stated, expected to be followed by a competition keener than ever before experienced. Those who have influence in directing the course of British orders for electrical products can hardly be blind to their duty to assist activity in the Home factories if they appreciate the necessity for securing prosperous national industries with increased employment. Driven by the sheer necessity of their financial responsibilities, the German people are expected to carry on a price-cutting competition the effects of which may be serious if our buyers—whether municipalities, industrial concerns, or private traders—allow themselves to pay regard to cheapness alone, disregarding the well-being of those who are engaged in, or waiting to be employed in, British industry. Purchasers of plant, advisory engineers, directors and committee-men alike, should seriously regard the responsibility that rests upon them to assist British electrical manufacturing to maintain a very strong position among the great national industries. We can understand the difficulty in which some engineers are placed when such questions arise, but wherever they can in reason do so they will serve the national interest better by fighting their difficulties and resisting the voice of the charmer who, by quoting figures alone and omitting references to the needs of our people, makes it appear a foregone conclusion that a foreign tender should be accepted. To quote the words of Col. Morcom, we appeal to our readers to do their utmost to resist "the lure of foreign dumping."

Hiring Electrical Apparatus.

The particulars given elsewhere in this issue by Mr. A. H. Shaw, M.I.E.E., engineer and manager to the Urban District Council of Ilford, with regard to the apparatus hired out to consumers by the Council are worthy of careful study. It will be observed that the hiring system is applied to both large and small apparatus—from costly washers, of which 13 are on hire, to toasters; it is somewhat remarkable that electric irons do not occupy a higher place in the list, as they are generally believed to be the most popular household appliance, but in this case the radiators take the lead, numbering more than one-third of the total.

As we have often pointed out in these columns, there can be no doubt that the hiring-out of electrical apparatus is a most effective method of increasing the use of electricity in the home, and every progressive undertaking should adopt it. In fact, we have no hesitation in declaring that any undertaking which does not adopt it has no right to be called progressive. Development is the great need of the moment, and every obstacle to it ought to be swept away with a firm hand, for the good of the nation, of the consumer, and of every section of the industry without exception.

The Electrical Development Association.

The Electrical Development Association, which held its annual meeting and dinner on Friday last, is to be congratulated not only on the success of the latter, but what is of vastly greater importance, on the great strides that it has made during the past year. Not only has its membership been notably extended—its revenue has increased by no less than 200 per cent.; this excellent result is due, as the new president, Mr. R. P. Sloan, pointed out, to the able guidance of the director, Mr. J. W. Beauchamp, and the work of his staff. We believe with Mr. Sloan that those who have subscribed to the funds of E.D.A. will receive a very good return on their outlay, and we are confident that the greater efficiency of the Association's propaganda resulting from the enlargement of its financial resources will continue to attract additional contributions, snowball fashion.

That there is enormous scope for development was indicated by Lord Burnham, whilst Mr. R. B. Mitchell and Mr. R. P. Sloan, both at the head of very large electrical undertakings, bore witness to the influence of E.D.A.'s work in promoting the use of electricity. Throughout the supply industry there is a firm conviction that the rapid advance in the domestic consumption of electricity which has been recorded during recent years will be not only maintained but accelerated, and the Association will play an important part in keeping the ball rolling in the right direction. As we have previously suggested, the distribution end of the chain of electricity supply is not less important than the generation end; if by Government action the supply of electricity is to be greatly increased whilst distribution is left to take care of itself, the industry must make good the deficiency, and in this work the Electrical Development Association will be a most effective agent.

Incidentally, we wish to enter a protest against the very unfair practice, adopted by the Weir Committee and by speakers at the E.D.A. dinner, of comparing the average consumption per head for the whole of Great Britain—and that only for public supply—with that of the most highly-developed portions of foreign States, such as Chicago and California. Why is no mention made, on such occasions, of *our* best areas, some of which are already at the 500-kWh stage of development?

Notes on the Leipzig Fair: Their Bearing on our 1927 Effort.

The British Industries Fair, 1927.

The announcement that was made last week regarding the British Industries Fair for 1927 has laid all uncertainty to rest, and it will now be possible for the responsible authorities to proceed full steam ahead with arrangements which shall ensure a larger collection of exhibits than at any previous Fair and a record gathering of buyers from abroad.

It is generally held that this year's Fair both in London and in Birmingham was a conspicuous success amply justifying the additional publicity backing that it received from the Government, and the President of the Board of Trade has now announced that a similar grant (£25,000) for publicity and propaganda purposes throughout the world will be made in respect of the Fair which will take place at about the same time next year. As before, the London arrangements will be under the care of the Department of Overseas Trade, and those at Birmingham will be organised by the Birmingham Chamber of Commerce.

This prompt decision is indicative of the Government's belief in the Fair as a means for continuing the stimulus already given to trade, and it enables all concerned to begin their preparations at an earlier date than on any previous occasion. There are already signs that the number of exhibitors and the space occupied will be considerably increased. Space is cheap, and British manufacturers and traders are urged to make their requirements known without delay.

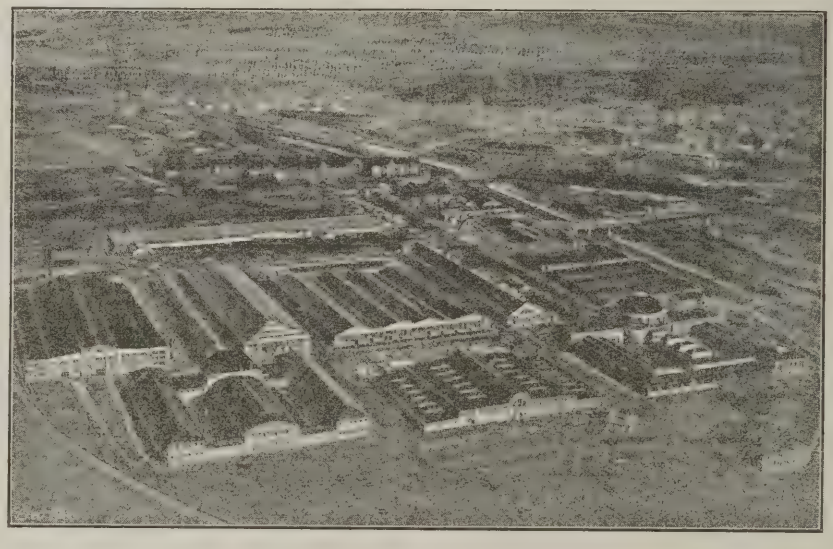

Fig. 1.—Bird's-Eye View of the Leipzig Technical Fair.

The decision to hold the Fair in two places still seems to us to be a wrong one, and we believe that ultimately a change will be made in favour of one big event at one centre, but the decision having been reached we will not now waste time discussing it further, as there are other points upon which we wish to offer constructive criticisms and suggestions designed to increase the efficiency of operations from now onwards until February and March, 1927.

Our readers do not need to be reminded that the Electrical Review used its influence, in co-operation with others, to secure that the British electrical industry should take a prominent part at Castle Bromwich. The story of the success of the Electrical Trade Section last month is familiar to all, and we believe that, while there was room for criticism, as there always is and will be, the general consensus of opinion was favourable toward the continuance and substantial enlargement of that Section next year. The electrical movement only began three months before the Fair opened this time, but that period proved amply long enough for exhibitors to bring together most creditable and businesslike displays. It was not long enough for special electrical efforts to bring overseas visitors to bear all the fruit that we desired. This year we have nearly eleven months in which to make our preparations, and if electrical exhibitors will make their plans early the world invitation to overseas electrical buyers should meet with a more general response because the publicity that the electrical arrangements have received in the Press during the past six weeks will have acquainted those buyers with the fact that the Fair at Birmingham is an Electrical Event of World Importance where they can see everything good that is going in British electrical products of most classes.

It has been observed by some that the Hall devoted to the electrical exhibits at Castle Bromwich was badly placed. Whether that be so or not, it must be remembered that it was the only one available when the movement for an Electrical Section seriously began. Other sections of industry had made up their minds regarding what they wanted, at an early date. The suggestion that such might give place to the electrical trade because it anticipates much larger requirements for 1927 is one for the general committee at Birmingham. No doubt if the demand is substantial enough, and is made in good time, new and special accommodation can be afforded. The point that we must stress most strongly in this connection, as in others, is the imperative need for prompt action by a strong electrical committee which shall be responsible for ascertaining the aggregate space requirements and working in close co-operation with the Department of Overseas Trade in compiling the fullest possible useful lists of buyers who ought to receive personal invitations to attend the Fair.

We believe that, considering the time and space at disposal, the eighty firms who exhibited at Castle Bromwich adapted themselves remarkably well to the shop, or market type, of stand, but in all probability, if things are now organised on a larger scale, this idea can be carried out still more effectively, as we have more time to devote to consideration of what is the best plan to work to.

The Leipzig Fair.

During the progress of the Birmingham Fair it was suggested to us that in view of the practical interest that the Review had taken in the scheme, we might assist the industry still further by proceeding to Leipzig during its great week (commencing on Sunday, February 28th) and studying the organisation and plan for that time-honoured event in the expectation that ideas might be gathered which would assist in perfecting the arrangements for London and Birmingham next year. The suggestion was also advanced to the Technical Press as a whole at one of the functions. We availed ourselves of the suggestion, and the present moment seems to be the appropriate time at which to publish some of the observations which our Special Commissioner has to offer.

It is with the London and Birmingham Fair in mind that one ventures to make a comparison between that combined event and the great German Fair at Leipzig, where the electrical industry was very strongly represented.

Leipzig is a fine, well-laid-out town of some 630,000 inhabitants—that is to say, approximately two-thirds of the size of Birmingham. The journey may be accomplished in comfort from London in 23 hours. While our own Fairs were only commercial in 1915, the year following the outbreak of war, that at Leipzig has taken place for centuries past and has been held in a variety of large

halls situated in different parts of the centre of the town. These halls are still used for many of the Fair purposes, but some 20 years ago it became necessary to find a much larger site on which to house the engineering and other technical exhibits. The so-called Technical Fair is therefore now situated some two miles south of the main railway station; it is fed by a good tramway service, and special 'buses are also provided to meet the various trains. About 100 special trains were run from all parts of Germany during the week.

The Technical Fair comprises 15 separate halls, of which the largest would compare favourably with the

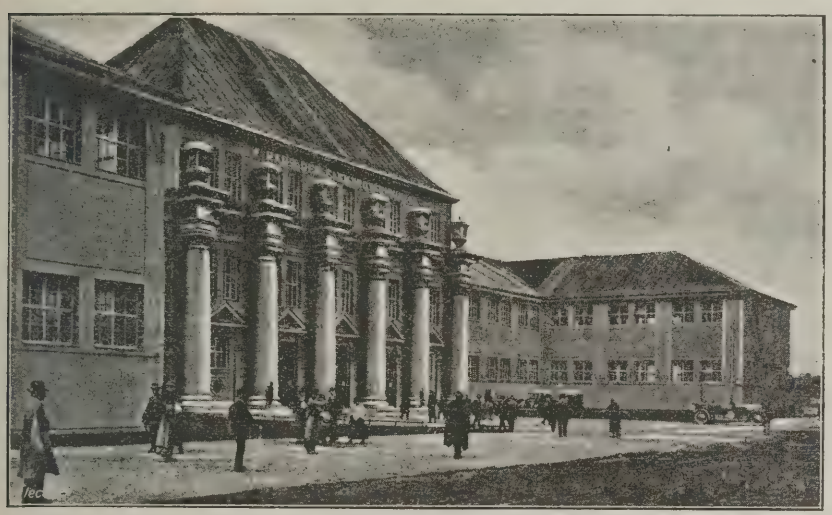

Fig. 2.—Haus der Elektrotechnik, Leipzig.

Palace of Engineering at Wembley; nearly all of these halls are fine permanent buildings.

International Character.

It should be clearly understood that the Leipzig Fair is international in character; that is to say, it is in no sense restricted to German goods, although, of course, the great majority are German. Any country can, if it so desires, take a hall in Leipzig and exhibit any of its productions that it chooses; for example, at this year's Fair, Italy, Czecho-Slovakia, Austria, and the Russian Republic all had separate buildings of their own. The Motor Car Hall contained more American than German cars, and French exhibitors were also to be found.

Organisation.

Centuries of experience, aided by the traditional German capacity for organisation, have built up a really wonderful machine. The Fair has permanent offices all over the world, from Iceland to the southernmost portions of South America, and the intending visitor from any of them will be given the fullest possible information. For example, in London (at 1, Gower Street) there is a Leipzig Fair office which is open all the year round, and the visitor can be advised as to trains, can secure vouchers for badges and catalogues, and can be assisted as to accommodation in Leipzig. A special office at the Leipzig railway station deals with all inquirers and provides accommodation when desired. When it is said that 150,000 people of all nationalities may descend upon the town in one week, it is clear that the usual hotel accommodation becomes totally inadequate, and it is necessary to secure the co-operation of the population, as is done here on a smaller scale when 2,000 members of the British Association attend annual congresses. The majority of private houses are pressed into service, and a complete card index of every available room is kept at the Leipzig station, and within a few minutes the incoming traveller can be fixed up with bed and breakfast at prices varying between 8s. and 10s. per night. Every visitor to the Fair must have a badge, and to obtain one it is necessary to furnish particulars of one's name, home address, and occupation. All badges are obtainable from the central headquarters in Leipzig, but vouchers for them can be purchased in the visitor's own country, and by so doing considerable saving is effected; that is to say, a badge voucher can be obtained in London at 2s. 6d., where 5s. would be payable if it were purchased on arrival in Leipzig. The same thing applies to vouchers for catalogues, the price being higher in Leipzig than if a voucher is obtained first in the visitor's own country. This small concession is obviously designed partly to lessen the amount of work at the Leipzig headquarters, and partly to induce the visitor to attend the Fair office in his own country, and so enable the representatives to become acquainted with him before he leaves.

This badge system is obviously of great value to the organisers, since it gives them a permanent record of all persons who attend the Leipzig Fair, and makes it possible for them to be communicated with at any future date. Every year, of course, this record of possible buyers grows, so that before the Fair opens the central or local organisations can be placed in touch with an immense number of what our American cousins call "prospects." The office or bureau inside the railway station at Leipzig provides the incoming visitor with practically any information he may desire, including accommodation, and he may also obtain the services of a first-class interpreter for any length of time. No one need hesitate for a moment to visit Leipzig on account of language difficulties; it is the business of the Leipzig people to see that this does not stand in the way, and it is done most thoroughly. We quote these particulars in detail because we believe that they have an important bearing upon the British Industries Fair. There is great room for us to profit from this particular piece of organisation work, for it has much to teach both the Department of Overseas Trade and the Birmingham Electrical Committee. The criticism that the visitor to Birmingham—the stranger—needs better assistance on arrival than he had this year was quite justified.

Fig. 3.—The Machinery Hall (No. 9) at Leipzig.

The Haus Der Elektrotechnik.

This is a very fine entirely permanent building with a large, lofty, and well-lighted central hall, which is surrounded by lower buildings also available for exhibitors on two floors. Meals can be had within the building, and on the top floor of the main hall is a large lecture room fully equipped for any desired demonstrations.

The arrangement of stands is very similar to that

adopted at the Birmingham British Industries Fair, each stand being the equivalent of a lidless box with one side removed. There is no competition as regards appearance of the actual stands themselves; all are of the same height, have the same form of lettering, and are of the same colouring; the only thing which differentiates between the sizes of the competing organisations is the amount of space taken. The A.E.G., Siemens and Halske and Siemens-Schuckert organisations had between them a floor space which was nearly as large as that occupied by the whole of the exhibitors at Birmingham. The Bergmann and Brown-Boveri companies also occupied a very large area. Some 340 exhibitors were housed in the main building, but there was a considerable overflow into a temporary hall (No. 5), where there were probably a further 80 exhibitors. These figures will give some idea of the magnitude of the electrical section of the Fair at Leipzig, as contrasted with that at Birmingham and London. Hall No. 5 was in part occupied by very small manufacturers, whose exhibits were simply staged on a counter running along one side of the building. There were not even partitions between these exhibitors, and in some cases they only showed a single novelty on a strip of counter about 3 ft. wide by 3 ft. deep. The exhibitor was provided with a single chair (if he was fortunate), and he covered his exhibit up with a piece of paper at night time. Some system of this kind might, with great advantage, be considered for future fairs in this country, as it should enable the small man to exhibit his goods at very little cost.

The Exhibits.

Speaking of the exhibits generally, even the largest makers did not stage very large pieces of apparatus. There were a number of big mercury-arc rectifiers, some heavy oil switches, and a few transformers of fairly high capacity. Rotary converters, large motors, and turbine plant were conspicuous by their absence. The Siemens group showed direct-current motors having a very wide speed range, *i.e.*, from 750 r.p.m. to 2,250 r.p.m. Particularly noticeable were the very large number of different stands exhibiting lighting fittings of every conceivable character, from the most elaborate electroliers down to single candles. Similarly, the makers of porcelain insulators of every description were very well represented, and the same can be said of the makers of small accessories such as lampholders, switches, ceiling roses, adaptors, &c. Electric irons were very strongly shown and a considerable number of bowl fires, but the ordinary household radiator, with which we are well acquainted here, did not seem much in favour. This may be due to the fact that it is much colder in Germany than in this country, and that the amount of electricity required to heat adequately a fair-sized room would be prohibitive to the average German. The ordinary middle-class house in Leipzig is fitted with double windows throughout, and each room contains an enormous stove which is heated with some form of compressed fuel. There were on one or two of the stands electric radiators which were made up to represent, to some extent, these stoves.

Wireless apparatus was not very prominently shown, except by a few of the bigger firms like the A.E.G., Siemens & Halske, &c. One noticed a fair proportion of "Amplion" loud-speakers.

English was not spoken on the majority of the stands, but all the bigger firms had available at least one man who knew our language.

Back to Birmingham.

Returning now to consideration of the Birmingham Electrical Fair for 1927 we are compelled to stress the importance of the Chamber of Commerce Council calling into co-operation a strong and larger representative committee which shall immediately take the electrical arrangements in hand. In the report of the B.E.A.M.A. Executive mention is made of the fact that the British Industries Fair is an event in which the individual manufacturer is not asked to refrain from exhibiting. Possibly the Council will feel that it can go further and point out to its members the desirability of their taking a share in this brief and inexpensive but very promising Market Event. A definite official approval would convey more definite guidance than the mere word "permitted." Possibly, too, the Chamber of Commerce in setting up an Electrical Committee may see the wisdom of inviting the various electrical industrial organisations to appoint representatives to sit thereon. We are confident that if all take a part in the arrangements a most impressive and effective electrical trade event will be assured, bringing only good to both our Home and our export trade.

Radio Receiving Aerials.

The Importance of Efficient Erection.

By PAUL D. TYERS.

The writer has recently examined a number of aerial systems installed by various electrical traders and, in his opinion, they were utterly deplorable. They nearly all seemed to show an absolute ignorance of what is really required, and one can only surmise that they must be representative of a vast proportion of the aerial systems which are installed throughout the country. Bad aerial systems have a far more deleterious effect upon the wireless trade than might at first be imagined. In fact, it is somewhat surprising that manufacturers of wireless sets are so utterly unconcerned with the manner in which their apparatus is used. The writer knows a case in which a well-known set of good design and manufacture was the subject of a very unfavourable criticism, due entirely to the fact that a local trader had installed it with the most appalling aerial system it is possible to imagine. Obviously, however efficient a receiver may be, it is no use expecting it to give excellent results unless the aerial system is equally efficient. It is believed that a short time ago some of the writers in the popular Press, in order to emphasise the efficiency of the modern receiver, pointed out how well it would function on quite a poor aerial. While this may be true to a certain extent, a statement of this nature is liable to prove very confusing, and tends to give traders a wrong impression. If by "poor aerial" is meant one which is not very high, and one which is possibly rather badly screened, then the writer agrees with this statement, but the best set cannot function efficiently with an aerial which is entirely wrong from several very much more important points of view.

Let us consider very briefly the chief requirements for a really efficient aerial. There should be no need to point out that it is desirable to make the aerial as high as possible, and place it where it is in the position of minimum screening. If circumstances are such that this cannot conveniently be done, it means that more care must be taken with other points in its installation.

Probably the most important point to remember is that the aerial down-lead should be as far from the wall as possible. Even if this means sacrificing some six or seven feet of the horizontal portion, this is of no importance, as increased efficiency will be obtained by keeping the down-lead well away from earthed bodies, that is, the wall of the house. The actual lead-in itself is important; the insulation should be as high as possible, and a good lead-in insulator should preferably be employed. A mistake which is frequently made is that of carrying the lead-in, when it has passed through the window, several yards round the room before it reaches

the aerial terminal on the set. Nothing can be worse than running the lead-in parallel with the wall or mixing it up with curtain rods and blinds. It is even not infrequent to find a lead-in actually fixed to a picture rail with bare staples before it reaches the aerial terminal on the set some nine or ten yards away. In the writer's opinion the best method of bringing the aerial into the room is to run the aerial wire itself straight through a lead-in tube, making the connection to it inside the house. Many prefer to connect the end of the down-lead to the lead-in insulator simply by connecting the wire to a terminal. If this is done care should be taken to protect it from the weather, as the wire is quite likely to become corroded, and a very poor contact is obtained. If the connection is made other than by means of a terminal at the end of a lead-in insulator, the joint should certainly be soldered, and again well protected from the atmosphere.

The actual aerial itself for ordinary broadcast reception need only be a single wire, and should be supported by really good insulators of ebonite, porcelain, or "Pyrex." From tests made on composition insulators, the writer would not recommend their use. Moreover, the insulator chosen should preferably be as long as possible, as this tends to reduce surface leakage. One of the best types of aerial is simply an ordinary copper wire, enamelled probably being preferable. A type of aerial which seems to have become very popular recently consists of covered stranded steel wires arranged round a single copper core. The tensile strength of this, of course, is greater than that of copper wire, but from an electrical point of view it would appear to have little to recommend it over the normal type. The covering on this type of wire, however, is insufficient for insulation purposes, and if used it should be regarded as bare wire.

Insulation for Low-Pressure Switchgear.

The Characteristics of the Materials Employed.

By J. O. KNOWLES, M.A.

The problems of insulation for high-pressure switchgear and cables sometimes overshadow the problems of low-pressure insulation, but whereas high-pressure gear is installed, attended, and maintained by experts, low-pressure gear is often at the mercy of men with little or no electrical knowledge. It is the fate of some low-voltage starters to be dumped in unlined packing cases into an open yard, left lying about in a half completed building and finally handed over to an electrical contractor in a state that would make the control gear manufacturer ashamed of his product. Again, after the gear is installed and connected up and given an initial cleaning up, the enemies of insulation—dirt, damp and chemical action—begin a prolonged attack, carried on from year to year, in November fogs and in summer heat, in air laden with dry dust and with wet dust, in clean workshops and in other places.

Consider then the usual forms of low-pressure insulation and their weaknesses, so as to know what margin of safety there is in commercial practice and in reasonably adverse conditions.

Slate.—This is at once the most common and the least used form of insulation. This paradox is obvious when it is remembered that when slate panels are used, one pole (in d.c., or two poles in a.c.) is commonly insulated from the slate by mica or other bushes, so that the insulation between poles (and also to earth) is not really the slate itself, but the insulating bushes. Why is this so? Slate is a good insulator, and especially if the front of the slate is enamelled and the back shellacked, the leakage across the surface is not found to be great in test cases. Metallic veins are not common, and even if slate is used from a quarry where metallic veins are known to be present, such imperfections are almost invariably discovered in a high-voltage test at the control gear maker's works.

The strength of the case for insulating slate with mica is that electrolytic action so often occurs between studs of opposite polarity on the same slate panel in damp conditions. The slate contains traces of chemical impurities which form with moisture a conducting path between the studs, which then become cathodes and anodes in an electrolytic bath. A whitish deposit appears round the studs of one polarity, which are slowly eaten away, and the studs of opposite polarity are marked with characteristic black patches. Except for the white deposit, which appears round the nuts on the studs through the slate, the action takes place within the holes in the slate, and a stud may be so eaten away as to break in two with the slightest vibration and yet show no external sign of breakage.

Some slate is more liable to this electrolytic action than other varieties. A rough test is to pour strong acid on slate in a powdered form. The greater the ebullition when the acid meets the chemical salts in the slate, the greater the likelihood of electrolytic action. The writer does not know of any slate that is free from this fault in conditions where studs of opposite polarity are fitted close together on the same slate and exposed to dampness. Insulation of one pole from the other with mica is the only safe cure or precaution. The back of the panel should, of course, be coated with shellac varnish *before* the connections are made, and all connections, on at least the pole that is insulated from the slate with mica, should be kept clear of the slate or electrolytic action will be set up where these connections touch the back of the panel.

Usually, in addition to the switchgear in positive and negative lines, there will be coil circuits across the lines, and where there is a drop in potential from the uninsulated pole, even if only of 50 or 60 volts across a coil or resistance, the studs should be bushed, at least if the coil or resistance is continuously in circuit or alive. It is usually possible to keep most of the switchgear parts on one pole or the other so that only a few studs require bushing with mica, and possibly a cheaper alternative to mica bushes would be satisfactory under all but very damp conditions.

Mica.—Steel bars and framework with mica insulation form an excellent if somewhat expensive construction. For switchgear which can be held in position by a few clamps only, this construction is much favoured. It is obvious that parts with heavy momentum, such as contactor armatures and quickly moving parts such as quick-make and break switches, should be clamped on the mica in such a way that the clamps cannot work loose and damage the insulation. Lock-nuts, washers, or patent nuts should be used and made absolutely secure on moving bars, and the size of bar should be such as to present a large surface normal to the direction of greatest shock.

Where a number of small contacts have to be used, steel and mica construction presents a little difficulty. It is not satisfactory to bush stud holes drilled so close to each other that separate washers cannot be used for each stud, for if one micanite plate covers a number of bushes, it is impossible to remove any faulty bush without dismantling the whole plate. For this reason a slate or Bakelite plate is to be preferred to steel and mica construction for starters and regulators of small sizes or of circular faceplate pattern.

Mica bushings should always be fitted so as to break joint, the same construction applying to coil spools of brass and mica construction. In this type of bushing, two micanite tubes are used, one inside the other, and two washers are used at each end, one of each pair of washers fitting over the inner tube and the other over

the outer. In this way the leakage path between tube and washers is much increased, and is diverted from the straight path, thus reducing the likelihood of breakdown.

Mica is perhaps the best of all insulators in its pure form, and not difficult to buy in a good quality. It is more difficult to keep it intact until it is bolted up in the job. Apart from wastage in storing and splitting, it is difficult to keep the mica washers or plates from being crushed, either by careless handling or by being tightened up without proper support underneath the nuts and washers that are being tightened. Micanite tubes, round and square, should be moulded on so that there is no looseness between the steel rod and the tube. Such looseness causes the clamp to distort the tube, opening the layers and crushing the mica.

Bakelite.—There is now a number of firms undertaking the manufacture or part of the manufacture of the synthetic insulation called by the name of "Bakelite" or a similar name, and the output of some firms is already measured in tons per week. It is necessary to say that the quality of such insulation varies according to certain factors, some of which are explained below. Slate and mica are substances formed by Nature, but bakelite is artificial, and depends on processes which may not be carried far enough. The user will be wise if he deals with a firm of standing, and further if he draws up a specification covering a grade of bakelite suitable for the conditions of his work. For ordinary low-pressure work up to 500 volts d.c. or 600 volts a.c., the following points will probably distinguish sufficiently the good from the bad.

Samples should be cut from sheets of the thickness to be used (in the case of sheets, not tubes), and two studs fastened through the sheet, say, one inch apart. Tests may then be made on such pieces as follows:—

(1) Pass through the studs such a current as will slowly raise the temperature of the bakelite to 300 deg. F. This test may be made in air, or the piece may be immersed in oil, according to the use to which the bakelite is to be put. *While still hot*, the insulation resistance between the studs should be measured. On many grades this will be found to be only a fraction of a megohm while hot, though as the bakelite cools, the insulation resistance increases rapidly to its original value of fifty or a hundred megohms. However, bakelite can be obtained which does not drop below 50 megohms even when hot, and this is preferable, since a loose connection or a hot contact would otherwise heat up the bakelite, start a leakage current through its low insulation resistance, and the leakage current will then add to the heat and eventually the bakelite will either char or break down both electrically and mechanically. With bakelite which does not lose its resistance when hot, such troubles cannot occur except in the worse cases of loose and chattering connections. This test will also show the presence of any free phenol in the bakelite. Under heat, any phenol present will bubble out between the layers of bakelite, and the opened layers are then exposed to the ingress of moisture. Good bakelite should not blister under heat.

(2) After soaking a piece of bakelite in water for 24 hours or more, the insulation resistance should not be less than 10 megohms between studs one inch apart (for low-pressure work). Bakelite sheets are made with impregnated paper, and if the paper is not thoroughly impregnated, moisture can creep in. Edges should be polished after cutting to seal them, and the holes should be drilled in a jig, which clamps the layers together. The heat of drilling (dry) will also seal the edges of the holes.

(3) A high-pressure test of 2,000 volts will show whether in polishing the surface of the bakelite any metallic dust has been pressed into the surface. Other tests can be made for specific purposes, but the above will eliminate many grades of bakelite now manufactured. Bakelite tubes can be tested in a similar way, but as the difference of potential is across the layers instead of along them, the tube will resist more successfully. The proportion of paper in the bakelite varies according to the grade, and should be specified and known, the price varying according to the amount of "dilution" with paper. The smaller the proportion of paper, the harder and more brittle will be the sheet or tube, though the effects of moisture will be less. Instead of using sheets of paper, other forms of dilution may be used, and thus permit of moulding, or the pure resin may be moulded without admixture.

Porcelain, &c.—For fuses and small switches, porcelain gives a cheap if fragile insulation. Much depends on the design, and while the porcelain should not be strained by any clamp or bolt, it should not be so loose as to break in the rough jolts of transit to site. With good design, porcelain would be more popular than it is.

There are many other insulating materials on the market, from imitation slate to milk (casein) products, and it is not fair to deal with them in general terms, as much depends on the conditions of damp and heat expected. Some heat-resisting insulators have an asbestos base, and care should be taken with these, as metallic particles occur in asbestos, and for insulation these must be thoroughly eliminated. The casein and other moulded insulators are made in many grades, and where moulded insulators are required, they offer a stronger but more expensive alternative to porcelain, though under certain conditions of heat (depending on the grade) they may distort through softening, and under moderate blows breakage may take place.

Electricity in Bulk.

With Special Reference to the Attitude of Small Local Authorities.

By A STATION ENGINEER.

One notices fairly frequently in the electric lighting notes of various trade journals announcements running somewhat as follows:—"The Slow-coach-in-the-Mud Urban District Council has at last decided to introduce a public supply of electricity. Messrs. Blank & Co., the Council's consulting engineers, have submitted a complete scheme estimated to cost £17,000, &c., &c." After a lapse of many months we again see an announcement somewhat along these lines: —

"The Electricity Commissioners have submitted to the Ministry of Transport for confirmation a Special Order authorising the Slow-coach-in-the-Mud Urban District Council to supply electricity in the Urban District of Slow-coach. At the same time the Commissioners do not approve of the erection of a small local generating station, but suggest that the Go-ahead Power Co. be approached regarding bulk supply terms."

Now Slow-coach although in this year of grace, 1926, not possessing a public electricity supply (incidentally it owns a Corporation gas works or, alternatively, the local gas company is strongly represented on the Council) considers itself a very important little community, with a result that indignation runs high at the thought that a supply of electricity be purchased from an outside source. Of course, Messrs. Blank & Co. also get the wind up, as a bulk supply means lower capital expenditure, hence less fees.

Now let us try and examine the causes of local opposition to a bulk supply. In the first place the idea of purchasing current from an outside source does not find

favour in a small country town which no doubt likes to feel independent. The consultants having put forward a complete scheme wish to see it go through and, therefore, harp on the unreliability of overhead transmission lines.

The Council owning the gas works is afraid of affecting its revenue and hopes possibly to run the electricity department, thus satisfying those residents who will have an electricity supply at all costs, but probably doing nothing to really popularise the supply. If power be taken from a power company it fears (in its small-minded way) that the company in its own interests will advertise the advantages of electricity in the district and thus force the Council's hand. It is an undoubted fact that local generation in a small way can at first show a saving in cost per unit sold, but if the potential demand is really to be met and electricity popularised, the small station needs considerable extensions and the original small generating sets become obsolete long before they have been written down very much. Large capital expenditure on plant and buildings has to be faced, the original small staff has to be augmented, and the very favourable costs per unit put forward by our friends Messrs. Blank & Co. are dwarfed. More plant means more repairs and maintenance, and many incidental costs not before taken into account.

Now contrast the foregoing with the conditions that would obtain under a bulk supply scheme. The power company would erect a transmission line that would serve the district for many years; the mechanical strength of the line alone would probably ensure this. Local extensions would be confined to a few more switch cubicles and transformers over and above the necessary distributor and feeder extensions.

What is the remedy? First, let the country town councillor be educated to regard electricity supply in terms of national development rather than local development, let him be told the truth regarding the reliability of overhead lines, and given a list of really important districts that are relying on bulk supplies. Let the economics of electricity supply be simply explained to him together with a brief outline of the Commissioners' general scheme of cutting out small generating stations and developing electricity supply in rural areas. Finally, let him be told that *bona-fide* consulting engineers will not approach him, but that his Council must approach them, and the only safe method is to apply to the President of the Institution of Electrical Engineers for a list of consulting engineers.

The method of education appears to be a job for the Electricity Commissioners. The preparation of a brochure for circulation to all local authorities should be a simple and comparatively inexpensive matter. Many small towns and rural areas await electrification, and many of these are doing nothing to get on with the job. A number are undoubtedly in receipt of ill-advice. In the meantime probably tens of thousands of prospective consumers are awaiting a supply of electricity, whilst their councils dilly-dally with the subject.

The Position and Prospects of the Electrical Industry.

Col. Morcom's Review and the B.E.A.M.A. Council's Report.

The annual meeting of the British Electrical and Allied Manufacturers' Association was held on Thursday, March 18th. We print below a summary of the report of the Executive Council for the year 1925, and an account of the speeches delivered at the annual luncheon held at the Connaught Rooms on the same day.

Three new members were elected during the year and three retired, so that the membership remains at 180.

The multifarious activities of the Association and its members necessitated the holding of 749 meetings and, in addition, members of the B.E.A.M.A. staff attended 300 meetings and conferences, *e.g.*, with the Board of Trade, Chambers of Commerce, and with other Associations.

The speakers at the annual luncheon were Dr. S. Z. de Ferranti, who proposed the toast of "The Electrical Manufacturing Industry," and Colonel R. K. Morcom, the chairman of the Council, who presided. The proceedings were brief and businesslike. From the report given below it will be observed that, after a few reminiscent remarks concerning the origin of the present Beama movement, Dr. Ferranti volunteered some straight words of counsel to members' representatives regarding the harm that they could do to everybody's interests by speaking disparagingly of the work of others. Colonel Morcom gave an excellent review of most of the outstanding matters which have a bearing upon the position and prospects of the industry. This we print in its complete form.

Colonel Morcom has been elected as Chairman of Council for a second year of office.

The Annual Luncheon.

The only toast beside the loyal toast was that of the "Electrical Manufacturing Industry." This was proposed by Dr. S. Z. de Ferranti, who said that the effect of the work of "Beama" had been to transform electrical manufacturing concerns from a state bordering on bankruptcy to moderately successful undertakings which showed a fair return and gave excellent service. It was most important that the industries of the country should be successful and prosperous, for they must have a fairly substantial margin by which to develop new markets, new processes, and generally to promote the advancement of such industries. In this way they could bring in revenue from abroad and give the people of the country very much better service in developing new commodities and things of usefulness which helped to make life go more easily. The essence of "Beama" was true co-operation, and true co-operation amongst members involved true loyalty. He was sorry to say that he knew of quite a good many cases where agents of members of "Beama" were not as loyal as they should be. By their misguided action they were responsible for injuring their country and their country's trade. It was due perhaps to over-anxiety to get business, but he was sure in some cases people went too far in decrying the goods of a competitor with a view to selling their own. It was when that occurred overseas that its effects were of a very mischievous nature, and could not but assist foreign competitors in getting business which would otherwise have come to this country. He appealed to members of "Beama" to do nothing to injure the general business of the manufacturers of this country.

The Chairman's Review.

Col. Morcom, in responding, first referred to the great assistance that had been given to the electrical industry by the increased publicity that the Press had given to electrical matters during the past year. Continuing, he delivered an important speech on the Electrical Industry in 1925. He said that electricity had become such an essential element of social prosperity that in attempting any survey of the performances of the electrical industry during the year it was necessary to consider the general conditions prevailing. The sooth-sayers hailed 1925 with a chorus of optimism. All the prophets—political, financial, and industrial—promised a picture of rosy colouring. Now that it was finished the rose was a very washy pink, and drab predominated. Yet the optimism was not without foundation. Important settlements leading to international stability were either in being or in making. The Ruhr incident was terminated, the Dawes plan agreed, debt-funding well begun, and currency stabilisation effected in many countries. A healthy growing demand for Empire products, largely due to the 1924 Exhibition at Wembley, augured well for Imperial trade. India was enjoying a period of unusual political tranquillity. At home the labour situation seemed on the mend, and the general spirit of confidence suggested that capital would now be freely spent on renovation and extension of plant.

Actually the year did show very great financial activity, as indicated by the increase in advances and clearings of the banks, and by the fact that 130 millions of new capital was subscribed for purposes other than those of the Govern-

ment and public authorities. This compared with 86 millions in the previous year. The satisfactory balance sheets of banks and finance companies reflected this activity in a marked degree. But industrially the year was one of disappointment, for in spite of free spending by the public and considerable prosperity in many trades, stagnation and decline were manifested in our basic industries, unemployment increased, and the volume of exports fell by 2.4 per cent. to 989 millions.

The Home Demand.

The electrical industry had been called one of the bright spots in a dark picture, but it did not escape from the general depression of heavy industry. British factories reported a serious falling off of orders after the first quarter of the year, especially in orders from collieries, iron and steel works, and textile factories. A slight improvement set in towards the end of the year, but the net result was a fall in home orders to 15 per cent. below the 1924 level. A particularly regrettable feature was the fact that nearly £5,500,000 worth of plant and apparatus for electrical purposes was imported. This was about 7½ per cent. of our turnover. The unemployment in the industry was about 6½ per cent. Had the patriotism of those who bought abroad been enough to resist the lure of foreign dumping, the industry would have been fully employed. This would have absorbed at least 15,000 men in the electrical industry and as many more in other industries. The fall in our home turnover was not all due to the general stagnation, but partly to uncertainty caused by the imminence of new electrical legislation, which caused the demands for heavy plant to fall below expectations. Including replacements, the plant sanctioned by the Electricity Commissioners was 480,000 kW. In relation to the increased consumption of electricity, this figure should have been 30 per cent. higher, while to make any appreciable approach to the standard of electrification in competing nations, it should have been doubled. The consumption of electricity increased from 1923 to 1924 by 15 per cent., chiefly through greater industrial electrification. In the face of severe competition and depression, one of the chief hopes of salvation to industry was to make more and more use of electricity. Of the total output of our supply companies, industry took 70 per cent. This high percentage suggested that the time was ripe for extension of the benefits of cheap electricity to greater use in domestic applications, in agriculture and in transportation. They hoped that railway directors would observe that of all our British main lines, the most prosperous was the one with the greatest electrified mileage.

International Comparisons.

The need for a fuller use of electricity by this country was shown by a comparison with other great industrial countries. Our output went up from 5,739 million kWh in 1922-23 to 7,415 million kWh in 1924-25, and so stood at 177 kWh per head of population. This figure in 1924-25 was 975 kWh for Canada, 800 for Switzerland, 560 for the U.S.A., 238 for France, 182 for Germany (542 taking the Ruhr alone), and 180 for Italy. The most ominous feature, however, was that while from 1922-23 we had increased our consumption by 27 per cent., Germany had increased by 52 per cent., and Italy by 75 per cent. In the calendar year 1925 the increase in the output of electricity in this country was only 7 per cent. over that of 1924, judging from the returns of undertakings supplying over 60 per cent. of the total output. This meant stagnation in electrical development, and unless they could make a great effort, they would be left badly behind.

Progress Overseas.

There was one result of 1925, however, of which the electrical industry might be justly proud. The depression of the home market was counteracted by great overseas activity. Our total exports at £17,351,000 were a record for the industry both in tonnage and in value. They showed an increase of 127 per cent. over 1913 figures. Taking the total exports of the five main exporters in 1913, the German share was 48.5 per cent., the British 23.4 per cent., and the U.S.A. 17.7 per cent. In 1925 the U.S.A. share was 31.5 per cent., the British 30.4 per cent., and the German 27.3 per cent. In the face of tremendous difficulties we had improved our world position. No small share of this success might, Col. Morcom thought, be laid to the credit of the B.E.A.M.A. through its research work, propaganda work, and other co-operative activities. To realise the magnitude of our achievement we needed to look at the capacity of our great competitors. The figures in his possession bearing on this point were for 1923, and these showed that the total electrical turnover of the U.S.A. was £284,000,000, of which 5.5 per cent. was exported; of Germany, £90,000,000, of which 15.7 per cent. was exported; of Great Britain, £70,000,000, of which 25 per cent. was exported.

The Gold Standard.

No *résumé* of 1925 could be complete without some reference to the effects of the return to the gold standard. The Prince of Wales, at the Industries Fair, called the export trade the life breath of the nation. The re-establishment of the currency rather winded us. Many traders in export business felt that the step was taken prematurely, and that it would have been better to wait till trade recovery had progressed further before taking it. Its effect, in making us a great buying country, was manifest in our remarkable import figure of 1,375 millions. It also explained the financial activity already mentioned. But the expected adjustments in the world's markets lagged sadly behind expectation, and he thought it was beyond dispute that through this lag the return to the gold standard was the last straw that broke the back of the coal industry, emphasised the crisis in steel and textiles, and, in fact, largely accounted for the disappointments of 1925.

On the other hand, if the advantages promised by the advocates of this important financial operation had been slow to materialise, the difficulties prophesied by its opponents had certainly fallen short of their gloomy prognostications. The financial prophet was notorious for missing the mark. He attributed this to the fact that he was an arithmetician, and therefore thought 2 and 2 made 4, whereas most of his units being vectors this simple summation was the exception rather than the rule. But prophecy apart, he thought they must all believe in the ultimate triumph of financial certitude and honesty. "We who are prepared to face the inevitable initial difficulties of standardising frequency are not the ones to cavil at the efforts of our financial leaders to standardise their own units."

Prospects in 1926.

The new year started with many of the best factors of 1925 still in being. The Dominions were undoubtedly flourishing, and had all embarked on progressive electrical developments. India, owing to the careful policy of Sir Basil Blackett, was in the strongest financial position she had achieved since the war. Good prices for Colonial produce had increased the buying capacity of the Colonies. Outside the Empire prospects were brightening. Japan had made good most of the damage from earthquakes and had established a favourable balance of trade. The Near East, the Northern and Balkan States, as well as Russia, were becoming increasingly potential buyers. In South America, Brazil had settled down, and the other Republics had had very good times. On the debit side, the chaos in China made trade with that great market very hopeless.

Over-speculation might cause a set-back in rubber-producing countries, the persistent fall in copper might be a source of depression in copper-producing areas, and a meat war was disturbing the Argentine. Further, the very unfavourable weather throughout Europe in the fall of 1925 had retarded the growth of wealth in many important agricultural countries. There were also financial grounds for apprehension; the French crisis, the weakness of the Polish zloty and the industrial crisis in Austria might be mentioned, while a hitch seemed to have occurred in the hopeful Belgian programme.

The Dawes Scheme and German Competition.

A more obscure but quite appreciable menace lay in the fact that the Dawes scheme would call on Germany to provide this year £61,000,000 from her internal resources. This was likely to reduce prices to an intensely competitive level. An analysis of German borrowing would show how serious this menace might be to the electrical industry in particular. In the 13 months ended January, 1926, Germany borrowed £79,000,000 from abroad, mostly from the U.S.A. Of this, 8¼ millions was for the account of electrical manufacturing, 20 millions for electrical supply, and 13¾ millions for iron and steel industry. That meant a subsidy of £42,000,000 to an already formidable competitor. The future was thus clouded by the competitive threat of the huge and wealthy American manufacturers and the subsidised strength of the German industrialists. And in these two countries there was a fine home market to help the export position, and their home markets were their own—no foreigner could enter them. The eagerness of the American investor to take advantage of the situation created by the Dawes scheme was already affecting adversely financial conditions in this country. We should need all our industrial resourcefulness to meet this competition, and we should do it if wise counsel prevailed in the settlement of the dilemma that might arise between the demands of labour and the necessities of the employers. As an example of the dangers of unrest, the uncertain future of the coal trade was undoubtedly holding up much work on which our factories could be profitably employed. The very able Report of the Coal Commission was receiving close attention from the Government and industry. It was to be hoped that a settlement would be reached which would give a measure of confidence and a possibility of continuity, and that soon. The result would be beneficial all round and a great stimulus to the electrical industry in particular.

The Electricity Bill.

Touching on the Electricity Bill, arising from the Weir Report, Col. Morcom said that it had long been realised that our position as an electricity consuming nation was unworthy of us. After careful deliberation a scheme had been put before the House of Commons to the end that we might no longer be open to this criticism. As electrical manufacturers, they were vitally interested, and would watch the progress of the Bill with keenness, for on its adequacy would depend, not only their own future prosperity, but the industrial prosperity of the whole country.

As bearing on national industrial efficiency the almost simultaneous publication of the report of the Coal Commission, the Weir Report, and the Electricity Bill was of overwhelming importance. The two subjects of coal and electricity in a country with but little water-power were almost one. On the Coal Report, the Prime Minister advised careful thought

and no premature judgment. In considering this group of three publications, the advice was of triple force.

Some critics had rushed into print with detraction or even condemnation of the Bill, largely ignoring its greater meaning and attacking it from the narrow viewpoint of self-interest. This was a pity, for if this measure was emasculated as was that of 1919, a very definite and perhaps fatal delay might be given to electrical progress. The figures that he had given showed that we had delayed enough. Among electrical manufacturers he found very general approval of the main financial and technical provisions of the Bill.

The arguments in the Report in favour of the pooling of supply, interconnection of stations, creation of joint authorities, and standardisation of frequency were convincing. The report went further and suggested action in the direction of standardising voltages of supply. There was no doubt that the cheapening of plant and apparatus by standardisation would be even greater through standardisation of voltages than through standardisation of frequency, and here closer adherence to the Report would benefit the Bill.

Consideration of the Samuel and Weir Reports together showed that both suggested the formation of a new controlling body. In the one case a National Fuel and Power Committee; in the other a Central Electricity Board. Great care would have to be taken to prevent interference and overlapping of these two bodies—unless, indeed, a Central Board could be so devised as to fulfil both functions.

Both the Reports noted the importance of utilising power from waste heat, and the Bill embodied this idea. The Bill went further, and in referring to waste power must refer to power available from industries in which heat from the exhaust of generating plant was utilisable. To make the cycle complete, the supply of industrial and domestic heat should be within the powers of the Board. The sites of the large steam power stations might well become sites for wholesale production of agricultural products in exhaust-heated glass houses. The keynote of the Bill being the formation of the Central Electricity Board, it was natural that the constitution, functions, and powers of that Board should have called forth most criticism. As the Bill moved towards its final form, these would probably be the grounds for most contention. Under the Bill, the Central Electricity Board, technically, administratively, and financially, was under the control of the Electricity Commission and had, therefore, no independent existence and, as far as could be seen, no real justification. The machinery contemplated for the selection of power stations, for dealing with supply undertakings, for the right of appeal against the Board to the Electricity Commission first and then to the Railway and Canal Commission, was not calculated to quicken up electrical development. Unless the Central Board received real executive powers and assumed the character of a strong industrial Board of directors with all the attributes of such an executive, it was difficult to see how it was to function effectively.

The Weir Report gave a true picture of what was needed to stimulate the electrical development of this country. He had tried to show how much more stimulus was needed.

The Bill, as at present published, contained much of the gist of the Report's recommendations. A clear view of the national importance of an adequate measure, and goodwill during its progress into law, should enable Parliament to produce a satisfactory Act and, if satisfactory, its effect on our welfare would be incalculably great.

The Report of the Council.

The year 1925, begun with a certain measure of optimism, was disappointing, even in comparison with 1924. The financial chaos in France, the restriction of credit in Germany, the tariff war in Central Europe, all retarded the general European recovery; while the final liquidation of the Ruhr adventure meant intensive competition from Germany in the supply of coal. In Britain, three events of importance stood out: the restoration of the gold standard with its consequences in the enhanced value of sterling abroad, the embargo on foreign loans, and the coal crisis. There is little doubt that the first caused a temporary depression in the great exporting industries and a severe restriction in international credit.

There was, however an upward tendency, and it is expected that the year 1926 will represent a time of real improvement.

The Association was consulted regarding the Government's Electricity Bill, and found itself in agreement with it on general grounds. A memorandum bearing on waste heat, power production, the constitution of the Central Board, standardisation of frequency, distribution voltages, and the capacity of the electrical manufacturing industry to meet national requirements, was submitted by the Association, and the Minister of Transport promised to give it his careful consideration. A first essential to meet international competition is an abundant supply of power at economic rates, and, with it, the electrification of industrial processes, so that production can be carried on at a maximum efficiency. Carried out on sound lines the work of reorganisation should raise the status of Britain as a great manufacturing country and improve the economic position of its basic industries, including the electrical industry.

The "Transactions of the First World Power-Conference" have been published in four volumes (6,500 pages), embodying the entire proceedings of the Conference. A meeting of the International Executive Council, of which the Director of the Association is chairman, was held in London last July, 20 countries being represented at it. The chief question discussed was the form of constitution to be adopted by the organisation, and a draft was agreed which has since been submitted for consideration by the National Committees in all participating countries. The International Executive Council further suggested that the Second Conference should be held in 1930, and that, between plenary meetings, sectional meetings might be held. A sectional meeting, organised by the Swiss National Committee, will be held at Bâle from August 31st to September 12th next. An enlarged British National Committee has recently been formed, and in it will vest the responsibility for the participation of Great Britain in the future activities of the Conference.

The Export Committee pointed out to the Australian Customs authorities in what way and to what extent the *ad valorem* basis of duty discriminates (notwithstanding the "preference") against British manufactures, and proposing such alternative methods of assessment as would remove the hardship without diminishing the Australian Customs' revenue. The same proposals have been or will be made to the Canadian Customs authorities, whose tariff is also under revision. The new Greek tariff has also been the subject of discussion with a view to proposals for modification. The South African Customs have recently increased the preference on British electrical and allied manufactures from 3 to 5 per cent. Careful attention has been given, at the request of the India Overseas Committee, to the conditions of contract of the India Store Department, and negotiations are in progress. The South Africa Committee has suggested that its work would be more effective if membership included agents as well as direct representatives of members; the matter is under consideration. The Argentine Committee has been disbanded, and the Association has become a member of the Buenos Aires British Chamber of Commerce.

During the year the Director and the Secretary gave evidence before the Board of Trade Committee on Industry and Trade.

Reference is made to the fifth annual report of the Electrical Research Association, which was reviewed in our issue of February 19th (p. 315), and it is recorded that the chairman of the Research Committee was unanimously elected Chairman of the Council of the E.R.A. for the session 1926-27.

The Council granted six scholarships during the year, four in electrical, one in mechanical, and one in mechanical and electrical engineering. The standard of knowledge and ability of the candidates was again satisfactory. Renewals of their previous scholarships were given to seven scholars. The Education Committee has had under consideration a new and enlarged scheme of scholarship which would lay the awards open to competition by students of any approved university or technical college throughout the Empire. The annual value of the scholarships would be largely increased; and the Committee considers that a B.E.A.M.A. scholarship might be made one of the most coveted distinctions of the engineering world. The relation of technical to other branches of education and to industry is being dealt with by a committee set up by the Association of Teachers in Technical Institutions, and the Association is represented on that committee by the chairman of the Education Committee. The number of overseas students in members' works at the close of the year was 184, an increase of 48 on last year's return, indicating the general trend towards improved industrial conditions. The countries sending the largest numbers were, in order of numbers: India (including Burma), Africa, Australia, South America, New Zealand, Egypt, British Guiana and West Indies, China, Japan, Canada, Tasmania, and the United States. A pamphlet entitled "Training in Electrical Engineering: Information for Overseas Students and Technical Centres in the British Dominions," was sent to 48 universities and technical colleges throughout the Dominions.

The issue in August, 1925, of the fifth edition of the Association's *Standardisation Rules* marks an important stage in British national standardisation. The first edition, issued in May, 1913, formulated for the first time, recognised British practice, and set up standards which have since formed the ground structure of British national specifications. During the past year three additional machinery specifications have been issued, *viz.*, No. 169, Large Generators and Motors (rating permitting overloads); No. 226, Large Generators and Motors (continuous maximum rating); and No. 225, Alternators of the Steam Turbine-driven Type. These four specifications have been adopted by the Association as superseding the original B.E.A.M.A. rules for electrical machinery. The latter rules are therefore omitted from the fifth edition and the B.E.S.A. has withdrawn No. 72/1917, which was not accepted as representative of British practice for industrial motors and generators for the home market.

The rules for the marking and colouring of bus-bars and connections have also been omitted from B.E.A.M.A. rules, together with all other subject matters for which British standard specifications have provided. As the result of a questionnaire, the Association suggested that for three-wire d.c. the voltages should be 230/460, and for three-phase a.c. 230/400. These standards were adopted by the B.E.S.A. and included in the revised standard specification No. 77, and have since been recommended for international adoption by the I.E.C. as alternatives to 220/440 volts d.c. and 220/380 volts a.c. Special panels have been set up by the B.E.S.A., under the Colliery Sectional Committee, for the standardisation of mining motors, transformers, switchgear, cable sockets, and boxes, &c. The appropriate sections of the Association

are represented on all these panels. The Technical Committee of the Switchgear Section has had discussions with H.M. Electrical Inspector of Mines on the subject of earthing conductors in mines. According to the regulations, the exposed metal cases or framework of electrical apparatus which may accidentally become "alive" must be earthed with a conductor having not less than half the conductivity of the "largest conductor used solely to supply the apparatus, a part of which it is desired to earth." The earthing conductor must be carried from the apparatus to an earth plate above ground. This, it is thought, is not absolutely necessary in every case, and conversations are still proceeding with a view to simplifying the conditions.

The extension of electricity by overhead mains into rural areas for agricultural and other purposes has involved the development of a special type of weather-proof switchgear and apparatus. The Standardisation Committee has requested the B.E.S.A. to prepare rules to cover the performance of this class of gear, and the Technical Committee of the Switchgear Section has drafted recommendations to serve as a basis for discussion.

The Association was well represented at the conference of the International Electrotechnical Commission held at the Hague in April last. Definite progress was made towards international agreement on the temperature limits of electrical machinery and the methods of temperature measurement. Final agreement was reached on the temperature of reference for statements of efficiency. Among other subjects considered were nomenclature, symbols, traction motors, overhead transmission lines and voltages, transformer oils, steam turbines, and hydraulic turbines. The discussions will be resumed at the Conference to be held in New York in April next, when, among other items, the questions of tolerances and methods of stating the efficiency of machines will be considered. The discussion on steam turbines and water turbines will be of considerable importance.

The Committee on terminal markings has reviewed the American and Continental proposals with a view to finding some common ground of agreement, and the chairman has recently attended a conference of international delegates in Paris to discuss the whole situation. Internationally there is a wide difference of opinion, and it is hoped that the British system, when complete, will commend itself to other countries as worthy of careful consideration. The technical committees of various sections, *e.g.*, Instrument, Instrument Transformer, Insulations, Meter, and Switchgear, have all been busily engaged during the year in reviewing and revising the standard specifications for apparatus made by them and in preparing draft recommendations for new specifications where none exists. Among the more important subjects under consideration is oil-immersed circuit breakers, which play an increasingly important part in the protection of electrical machinery and distributing and transmission systems. A list is given of specifications of interest to members, published during the year by the B.E.S.A.

The Association's solicitor reports that several municipalities which had hitherto resisted suggestions for the amendment of their own sets of conditions of contract to bring them into line with the I.E.E. text, are now content to accept that text as the basis for discussion. Clause 37 of the text was amended by the I.E.E. Committee during the year so as to define more clearly the nature of the "Regulations and Bye-laws of Local Authorities" with which the contractor is obliged to make himself acquainted before contracting. After discussion with the Engineering Employers' Federation, members were recommended to tender three fair wages clauses, of which the first, governing work in the factory, is the well-known Parliamentary clause, and the other two, governing labour sent from the factory for erection and labour taken on at site, are new.

The I.E.E. Council passed for publication the two new complete texts governing respectively f.o.b. and c.i.f. contracts, but these were found to be susceptible of improvement and were sent back to the I.E.E. Committee for review. Their re-issue is expected during the present session. The Council invited the views of all sections during the year as to the desirability of introducing into the payment clauses of the conditions of sale provisions for deferred payments or hire purchase, but the answers showed any change to be unnecessary.

During the year the Traffic Committee has been mainly occupied with the proceedings of the Railway Rates Tribunal, and it records its disappointment at the slow rate of progress, which, however, appears to be inevitable in view of the magnitude of the task. When the Railway Act, 1921, was passed, it was expected that the Revised Classification of Merchandise and the Schedule of Standard Charges associated with it would be put into operation on January 1st, 1923. Three anniversaries of that date have passed, and "the appointed day" is not yet in sight. The opinion has been steadily gaining ground that, admirable as the Railways Act of 1921 may be in theory, the practical advantages which it was intended to confer are largely illusory. Such progress as has been made has been largely due to discussions out of Court between the representatives of the traders and of the railway companies, who have arrived at agreements which the Tribunal has subsequently ratified. These discussions have served to bring the two parties into a closer realisation of each other's difficulties and to a fuller appreciation of their common interests.

During the latter part of 1924 the Council instituted a new department to take charge of the economic and statistical sides of the Association's activities. During the year the department prepared evidence which was submitted to the Board of Trade Committee on Industry and Trade on the economic position and prospects of the electrical manufacturing industry; prepared a survey of the present state of electrical development in Britain, published under the title, "Electrical Power and National Progress"; issued a number of special publications, among which "The Swiss Electrical Industry" and "The Electrical Industry in France" may be mentioned; and was responsible, directly through its own contribution or indirectly by means of information which it published or otherwise rendered available, for the appearance of over 60 articles in the Press dealing with electrical power. It also collaborated in the preparation of a special electricity supplement to the *Financial Times*.

In setting up a publicity service the Council had primarily in mind the creation of an atmosphere favourable to greater electrical development in Britain and to associate with such development the achievements of members. In view of the fact that new electrical legislation was contemplated by the Government, it was considered advisable to concentrate on the daily Press, thus creating a strong background of public interest in the subject; and, during the last three months of the year display advertisements were inserted at regular intervals in the leading newspapers and the technical Press.

The publicity department also circulated literature dealing with electricity. Special booklets were prepared which might be used in the examination and discussion of the Government's electricity proposals.

The Electrical Development Association reports a further expansion during the year, 64 new members from the supply side of the industry having been added to its roll. In addition, an augmentation of its income, amounting practically to treble that of the preceding year, took place. The Electric Vehicle Committee now forms the Electric Vehicle Committee of the Association.

It is hoped to issue shortly a publication under the title of "Standard System of Cost Accounting in the Electrical Industry."

The Council affirmed, during the year, a previous decision, that all British Industries Fairs, wherever held in Great Britain, are permitted exhibitions.

During the year a Motor Control Gear Section was formed, which absorbed the Controller Section. The Industrial Instrument Section and the Scientific and Telegraph Instrument Section became amalgamated under the title of the "Instrument Section."

The series of booklets, under the general title of "Standard Schedules of Guarantee and Performance" was added to during the year by the publication of one on "Rotary Converters." "Information for Members" was, at its annual re-issue, greatly enlarged so as to afford full information as to the *personnel* of the Committees and Sections of the Association, and to include a diagram from which the working of the whole organisation can be seen at a glance.

The Council acknowledges the assistance which it received during the year from allied or kindred institutions, particularly from the Cable Makers' Association, the Accumulator Makers' Association, the Engineering and National Employers' Federation, the Federation of British Industries, the Institution of Electrical Engineers, and the Incorporated Municipal Electrical Association.

The Rating of Generating Plant.—The Electricity Commissioners inform us that in dealing with applications for their consent to the establishment of new or the extension of existing generating stations, they have noted a growing tendency to provide for the installation of steam-turbo-alternators designed for a continuous maximum rating and a service rating (most economical output) as defined in Specification No. 225-1925, published by the British Engineering Standards Association. The practice hitherto followed in submitting such applications has revealed a lack of uniformity, the capacity of the generating plant proposed to be installed being defined in some cases in terms of the most economical output, and in other cases in terms of the continuous maximum rating.

With the view of obviating inconsistencies and of facilitating direct comparison of the plant capacities of different undertakings, the Commissioners have decided to adopt the continuous maximum rating when giving consent, under Section 11 of the Electricity (Supply) Act, 1919, to the installation of steam-turbo-alternators of the kind in question. With regard to the statistical returns already issued by the Commissioners, the necessary adjustments will also be made in so far as any figures for plant capacity contained therein are included in future returns.

Mines Department Publication.—The Secretary for Mines announces that the 1925 edition of the Annual Volume of Regulations and Orders under the Coal Mines Act, 1911, has now been published, and may be obtained through any bookseller or direct from H.M. Stationery Office, price 1s. net; by post 1s. 3d. In this edition, which contains the Statutory Rules and Orders relating to mines in force on December 31st, 1925, the amending orders have been consolidated with the relative principal orders and a general subject index has been added.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

Perak Hydro-Electric Scheme.—On March 15th, Mr. Forrest asked the Secretary of State for the Colonies when it was proposed to commence work on the Perak hydro-electric scheme; and from what source and under what conditions was it proposed to recruit the necessary labour for the purpose.

Mr. Amery said that the Company which was to carry out this scheme had not yet been formed, and he was therefore not at present able to answer the question.

The Broadcasting Committee.—On March 16th, Sir Wm. Mitchell-Thomson, the Postmaster-General, replying to questions, said that in view of the expense involved, it was not proposed to publish the evidence given before the Broadcasting Committee. The report of the Committee had not yet been considered by the Cabinet.

Railway Electrification.—On March 16th, Mr. Barclay-Harvey asked the Minister of Transport, if, having in view the admitted success of the Southern Railway electrification scheme, he would press other railway companies to proceed with electrification schemes in other areas where conditions were reasonably similar, and where in consequence similar successful results might be obtained.

Colonel Moore-Brabazon said that as the railway companies were aware, the Minister would be very glad to see an extension of electric traction on railways where this could be done with advantage to the public and the results would be likely to justify the expenditure involved. It must, however, necessarily rest with the companies to satisfy themselves before embarking on any such scheme that it was likely to be satisfactory from every point of view.

On March 16th, Mr. Scurr asked the Minister of Transport whether he was aware that under Section 21 of the Act of 1912, whereby the Midland Railway Company acquired the London, Tilbury and Southend Railway, the company was under an obligation to prepare forthwith a scheme for working traffic by electrical power by the direct route between Fenchurch Street and Southend; whether a scheme had been prepared; and, if not, whether he would take steps to cause the railway company to fulfil its statutory obligation.

Colonel Ashley said he was aware of the provisions of the section referred to, but he did not think that it would be proper for him to express any opinion as to whether the railway company was, or was not, complying with them. He had no knowledge of any present intention on the part of the company to electrify the line.

The Electricity Bill.—On March 18th, Mr. Baldwin stated that he hoped to take the second reading of the Electricity Bill on March 29th or 30th.

Asked whether, owing to the complexity and technicality of the measure, its second reading could be postponed until after Easter, Mr. Baldwin said he felt that a knowledge of the technicalities would be far more useful in Committee than on the second reading, as he thought the Committee stage was the one to which members should devote their time. His object was to get the Bill into Committee, where it would require a great deal of examination, at the earliest possible date.

Mr. Dennis Herbert, a Unionist member, has given notice that on the second reading of the Electricity Bill, he will move: "That this House, while recognising the need for legislation to facilitate generation and supply of electricity, regards it as unnecessary and inexpedient to proceed with a measure which is calculated to bring about the nationalisation of the industry and which places the industry under the control of, and delegates powers of Parliament to, a body, or bodies, of persons who are assisted by, and dependent upon State guarantees and are not directly responsible to Parliament."

Mr. Hannon and Sir Philip Dawson, also Unionists, have given notice that after the second reading of the Bill, they will move: "That it be an instruction to the Committee that they have power to substitute 'the Ministry of Transport' for 'the Electricity Commissioners,' in Clause 4, sections (1) and (3); Clause 5, sections (1) and (3); Clause 6, sections (2) and (3); Clause 7, section (5); Clause 9, section (1); Clause 11, section (1), sub-section (b), and section (2); Clause 18, section (2), sub-section (b); and Clause 24, sub-section (1)."

No Broadcasting of Speeches.—On March 22nd, Mr. Baldwin informed Mr. Campbell that he had consulted with the leaders of the other parties and had obtained information through the usual channels. He had come to the conclusion that there was a greatly preponderating body of opinion against the broadcasting of the proceedings of Parliament.

Cash-on-Delivery Service.—On March 18th, Sir Alfred Knox asked the Prime Minister whether any conclusion had yet been arrived at as to the institution of an inland cash-on-delivery service.

Mr. Baldwin said that the Government, after careful consideration of the whole subject, had decided that those facilities ought to be afforded to the public. Arrangements had accordingly been made for the institution of an inland cash-on-delivery service as from March 29th.

Municipal Electrical Service.—Under this heading we report elsewhere in this issue part of the proceedings before the House of Lords Committee which dealt with the Colwyn Bay and Colwyn U.D.C. Bill.

On March 22nd and subsequent days a Select Committee of the House of Commons considered similar clauses in the Doncaster Corporation Bill. The proceedings will be reported in our next issue.

Wireless Apparatus Imported.—On March 19th, Mr. A. M. Samuel informed Mr. Day that the following statement showed the imports and exports in the year 1925 of radio instruments, apparatus and valves. The figures were provisional, and subject to possible amendment on final verification of the returns:—

	Radio Instruments and Apparatus.	Wireless Valves.
	£	£
Total imports	654,433	134,048
From United States	110,760	6,567
,, Germany	348,366	7,402
,, France	55,525	32,908
,, Netherlands	14,309	55,678
,, Switzerland	72,043	37
Total exports of United Kingdom manufacture ..	£1,106,311	£183,304

The particulars excluded the imports and exports of batteries and accumulators, and other material, the ultimate use of which could not be ascertained at the time of importation or exportation.

Reviews.

Atomicity and Quanta. By J. H. Jeans, D.Sc., LL.D., F.R.S. Pp. 64. London: Cambridge University Press. Price 2s. 6d. net.

This book consists of some 10,000 words delivered as an address on May 11th, 1925, being the Rouse Ball lecture. The matter it treats of is exactly described by the title, but the object of the writer, clearly to be discerned in a perusal of the book, is to deal with the contradictions which at once appear when an attempt is made to reconcile phenomena of quanta with the mechanical laws which govern the behaviour of natural forces. He points out that phenomena arising from the emission of radiation seem to indicate that energy, once freed of matter, may radiate according to the laws laid down in Maxwell's equation; while phenomena which arise from absorption of radiation, indicate that radiant energy must conform with a corpuscular theory.

The difficulty is to find any theory which accounts for a quantum of monochromatic radiation being specially concentrated upon a single absorbing atom. The book concludes with a sigh, as clearly as print can convey it: "Not much meditation is needed to convince us that we are still very far from understanding the working of the atom or the true meaning of atomicity and quanta."

Electrical Engineers' Data Books. By E. B. Wedmore and D. V. Onslow. Vol. I. Lighting, Traction and Power Distribution. Pp. xxi+714; figs. 203. Vol. II. Manufacture, Design and Laboratory Work. Pp. xvi+471; figs. 151. London: Ernest Benn, Ltd. Price 15s. net each volume.

Though there are many "pocket books" on the market, the average engineer is always interested in the appearance of a new one, for he feels—and rightly so—that no book can fill every requirement and one can never have too much information at one's disposal, provided that it is easily accessible and up to date. In these respects the Data Books now before us attain an unusually high standard. They are entirely new productions in the compilation of which the Editors have drawn upon the latest available research work, test data, standardisation work, professional papers, and manufacturers' publications. That a number of important B.E.S.A. specifications have been issued since the Data Books appeared, is merely an instance of the difficulty which faces every writer on electrical subjects. From the great stress laid by the publishers themselves upon the importance of keeping pace with research workers, we infer that new editions of these Data Books will be issued at frequent intervals. Indeed, so rapid is the advance of knowledge in the electrical field that even an annual publication becomes appreciably out of date during the interval between successive issues. If subjected to frequent revision, however, the Data Books will continue to fulfil their avowed purpose as usefully as they do now.

The general scope of the volumes is well indicated by their titles. Thus Vol. I includes sections on illumination, batteries, power distribution, switchgear, traction, motor control, and electrical machinery; whilst Vol. II deals with insulation, electrical phenomena, properties of metals, &c., bridge measurements, and pyrometers. In *both* volumes there are the same appendices, *viz.*, mathematical, electrical, mechanical, physical and miscellaneous tables, standard data on electricity and magnetism, and abridgments of wiring rules and regulations. This brings us to our first criticism of the Data Books, for it seems a pity to have duplicated 194 pages in each volume. With the two-volume arrangement of the work this could not be avoided, for there is much indispensable matter in the appendices, but the majority of those interested in this class of refer-

ence book will purchase both volumes and, to our mind, it would have been better to have combined Vols. I and II, making a work of 990 pages, instead of the 1,185 pages now existing. The whole of the data would then have been within one pair of covers and there would have been one index instead of the two which must now be consulted. The present arrangement of the indexes, each *in front* of the 194-page appendices, is definitely inconvenient, especially as there is neither tinted paper nor thumb-hole to help one to find them. Also, the pagination of the appendices in Roman numerals will not commend itself to engineers in a hurry; for instance, it is harder to interpret and locate cxlix than 149. This particular inconvenience is due to the duplication of the appendices and the separate page-numbering thereby involved.

So much for the general arrangement of the books; their production is of the highest excellence and, with the exception of the appendices, there appears to be no avoidable repetition, so that the purchaser of the two volumes has close upon 1,000 pages of carefully selected information for the modest sum of thirty shillings.

It being impracticable to read the whole of a work of this nature for the purpose of review, we have adopted the more rational test of referring to the Data Books as frequently as possible for assistance on knotty points during a period of two months. In many instances the desired assistance was forthcoming but, on the other hand, there appear to be some surprising omissions. From a comparatively short acquaintance with a work of this magnitude it would be rash to say that any particular item of information is not given somewhere, but so far we have been unable to find in the Data Books particulars of the electrical properties of phosphor-bronze and telephone wire. Also, we can find nothing concerning rotary boosters and balancers, though there is a useful section on booster transformers. Similarly, we have drawn blank as regards induction regulators and rotary converters, but obtained some useful data regarding power-factor correction and mercury rectifiers. A bare four lines concerning neon lamps helped us not at all, but we found all that we wanted to know concerning storage batteries. The only data on heating and cooking appliances appear to be the I.E.E. rules on the subject; and the chapter on switchgear consists mainly of B.E.S.A. definitions and specifications. Protective systems are described at considerable length, but there is little in the way of actual data concerning their adjustment and operation. We are unable to find anything on the subject of intermittent arcing earth faults. There are some figures relating to lifting magnets, but none for magnetic chucks and clutches.

Admittedly electrochemical and electrometallurgical work does not come within the scope covered by the titles of these volumes, but in our opinion these branches of the industry should have received attention; possibly they are to be dealt with in a later volume. Harmonics and harmonic analysis come distinctly within the province of these books but, so far, we have located nothing on the subject.

In setting out this list of apparent deficiencies we would not have it thought that we are decrying the books. An immense amount of care and labour has been devoted to their preparation and they are correspondingly useful to the purchaser. They are distinctly books which every electrical engineer should examine to see whether they would be of material assistance to him in his work. As already stated, they are extraordinarily inexpensive and, to a great number of engineers, money expended on them would be an excellent investment. Our main criticism—or perhaps it would be fairer to say our general impression—after using the Data Books for some time, is that the contents include more extracts from official and semi-official rules, regulations, and specifications, than one would expect from the title of the work. To many this will be an added merit, especially as it is a feature not elsewhere to be found. Our own preference, however, is to consult the original text of all regulations and specifications, these being procurable at nominal expense directly they are published. At the same time, if we had not these Data Books already on our shelf, we should purchase them.

Re-winding Small Motors. By D. H. Braymer and A. C. Roe. Pp. xiv + 247; figs. 210. London: McGraw-Hill Publishing Co., Ltd. Price, 12s. 6d. net.

It sometimes happens that after a motor has been repaired, its performance is totally different from what it was before. The suspicion then arises that the windings are not identical with the original ones, but it is a difficult matter to find out the discrepancy.

The authors of this book have evidently had practical experience of this trouble. When a motor is received for repair, the first thing to be done is to make a detailed record of the windings before beginning to strip them. The authors devote a considerable space to explaining the best methods of making these records. Forms are suggested for recording all the details of the windings, including the insulation, the winding pitches and the commutator lead, the last of which is so often overlooked.

The book is divided into two parts, one for d.c. and the other for a.c. A great variety of windings is dealt with and full information is given as to how to make the coils, how to place them in the armature or stator, and how to connect them up. Methods of testing are also described and it is pointed out how much cheaper it is if the test shows that the machine is correct than if it has to be re-wound owing to faults.

The scope of the book covers motors for portable drills, fans, sewing machines, automobile starters and lighting dynamos and the like. It is full of information clearly put and certainly should be in the hands of everyone engaged in this class of work.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Australian Plant for Sydney.—The Sydney (N.S.W.) correspondent of the *Daily Telegraph* reports that the Municipal Council has accepted the tender of the Commonwealth Shipping Board to supply turbo-alternators for the Council's new power station at Botany Bay, at a price of £666,000. The board will undertake the work at the Cockatoo Dockyard in collaboration with the Metropolitan-Vickers Electrical Co., Ltd., which has granted a licence to the board to make the machines. The accepted price is £38,000 above the lowest tender, and in addition there is Customs duty of £126,000. The acting manager recommended the lowest tender, but the Council desired to secure that the largest possible proportion of work should be undertaken in Australia. A deputation of electrical manufacturers asked Mr. Bruce to prevent the Commonwealth Shipping Board competing with private enterprise, but the Prime Minister said that Cockatoo Island was primarily required as a naval dockyard, but the overhead expenses would be tremendous if the board were not allowed to undertake other work.

The Cash-on-Delivery System.—It was announced last week that a postal cash-on-delivery system would be instituted by the G.P.O. on March 29th. An explanatory leaflet which has been issued shows that the fee for the service varies from 4d. on parcels valued at not more than 10s., to 2s. for parcels valued at £40, which is the maximum permitted. The system is already in successful vogue in a number of countries, including the United States, Germany, France, several British Dominions, and other important States.

Organisation.—A lecture on this subject was delivered on March 17th by Mr. P. J. Sims, of the General Electric Co., Ltd. (Glasgow), before the Edinburgh Electrical Society. The author dealt with the matter from the standpoints of the supply company, the consulting engineer, the manufacturers, the factors and distributors, and the contractors. There was a large attendance of members of all branches of the electrical industry of Edinburgh and district. An interesting discussion followed.

Proposed Ecuadorean Tariff Increase.—It is stated in the *Board of Trade Journal* that the Government of Ecuador has under consideration of a new Customs tariff which will impose an all-round increase of from 5 to 10 per cent., and if adopted will be put into force within the next three months.

Employment During February.—The March *Ministry of Labour Gazette* reports that employment in the engineering industry during February continued bad on the whole, although it remained fair in the electrical section. The overall proportion of unemployed was 11.3 per cent., while in the electrical section it was only 6.6 per cent. The detailed statistics show that the number of unemployed in the electrical engineering industry at February 22nd was 5,075 out of a total of 76,720 (July, 1925). This represents an increase of 0.1 per cent. as compared with January, and one of 1.1 per cent. in comparison with February, 1925. The percentage of unemployed in the electrical wiring and contracting industry is shown as 8.6, a decrease of 0.9 per cent. as compared with January, but an increase of 0.8 per cent. in comparison with February, 1925. In the electrical cable, wire and electric lamp manufacturing group the proportion of unemployed rose by 0.3 per cent. to 7.8 per cent.

The Industrial Alliance.—As the result of a ballot, the Boilermakers' Society has decided not to join the projected "Industrial Alliance." Only a very small proportion of the members voted, but the ballot showed figures of two to one against the proposal.

Social Event.—The annual concert given by the management of the Union Cable Co., Ltd., Dagenham Dock, Essex, was held at St. Margaret's Hall, Barking, on Saturday, March 13th. Mr. J. Snow Huddleston, the general manager, was prevented at the last moment from attending, but the management was represented by Mr. F. W. Johns, secretary, and Mr. Howitt Smith, works manager. About 700 employés and friends were present. The entertainment was presented by Mr. Charles Hayes and his company.

Unemployment.—The number of unemployed persons decreased further during the week ended March 8th, the total at that date being 1,094,100. This was 13,038 less than on March 1st and 126,633 less than on March 9th, 1925.

Wages in the Engineering Industry.—Although contrary to their declared principles, the trade unions in the engineering industry decided at a meeting on March 16th to approve of local applications for increases in wages.

One of the first sections to take advantage of this decision is the Lancashire and Cheshire district. A conference was held in Manchester on Saturday last to consider the course of action to be followed, and it was decided to ask the employers of the district to meet the men in conference upon the subject. It is anticipated that an increase of 20s. per week will be asked for. The *Daily Dispatch*, in reporting this matter, states that the wages of skilled men in the area are 56s. or 57s. per week and those of labourers range from 37s. to 39s.

The Engineering Joint Trades Committee of the London area arranged a conference on Wednesday last to consider the Unions' application for an increase of 20s. per week in their members' wages.

Threatened Strike at Birmingham.—A week's notice of their intention to cease work was handed in on March 16th by electrical fitters employed in the Birmingham Corporation Gas, Tramway, and Omnibus Departments. They asked that their wages should be brought up to the level of those paid to fitters in the Electric Supply Department, but this was refused by the Salaries, Wages, and Labour Committee, which stated that conditions in the Electric Supply Department were governed by a special agreement which did not apply to men employed elsewhere. The Tramway Committee is said to be in favour of granting an increase, and has asked the Salaries, &c., Committee to reconsider its decision.

Trade Announcements.—The ALTON BATTERY CO., LTD., of Alton, Hants., has appointed Messrs. Campbell, Gardner and Co., of 79, King Street, Belfast, as its agents for the whole of Ireland.

Factory premises have been leased at North Acton for the manufacture of INVENTUM electrical appliances, including their electric cistern. Mr. A. Wright, Sentinel House, Southampton Row, London, W.C.1, is the sales organiser.

MESSRS. HOUGHTON-BUTCHER (GREAT BRITAIN), LTD., have opened a new trade counter and demonstration room for radio apparatus at their premises, Ensign House, 88-89, High Holborn, W.C.1.

The STANDARD INSULATOR CO., LTD., has just removed to Winsley House, Wells Street, Oxford Street, London, W.1.

Catalogues and Lists.—MESSRS. FERRANTI, LTD., Hollinwood, Lancs.—An illustrated leaflet advertising transformers for big power schemes.

MESSRS. BAXTER & CAUNTER, LTD., 219, Tottenham Court Road, W.1.—A well-illustrated catalogue dealing with Newton d.c. motors and dynamos, and special transformers for use in charging radio and automobile batteries.

METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester.—Publication No. 7,747/6, a brochure containing very complete and illustrated particulars of electric winding plant. Also Descriptive Leaflet No. 750/1-1, dealing with the company's coal-cutter protection system.

HIGGS MOTORS, Witton, Birmingham.—A stock list of a.c. motors and d.c. motors and dynamos.

THE SILUMINITE INSULATOR CO., LTD., The Green, Southall, Middlesex.—A leaflet advertising the safety of the company's covers for live rails.

Bankruptcy Proceedings.—A. SANDGROUND, 32a, Allerton Road, Lordship Park, radio factor.—The receiving order in this matter was made on a creditor's petition. The statement of affairs showed liabilities of £214, and there are no assets. Debtor attributes his failure to lack of capital, keen competition, and depression in trade. After being in a different business, he commenced as a radio factor, in March, 1925, when he had a deficiency of about £60. He obtained goods on credit, but the business was not a success, largely by reason of the heavy expenses, and in October, 1925, the petitioning creditors obtained judgment against him for £121. The following are creditors:—

	£		£
Cleartron Radio, Ltd.	70	Hayward & Co.	130

A. E. BURROW and A. G. L. PRAHM, trading as World's Fair Supplies, Bushy Lodge, Totterdown, Bristol, makers of electrical and mechanical games.—The first meeting of creditors was held on March 17th, at the Official Receiver's Offices, Bristol. The statement of affairs showed liabilities of £815, against net assets of £212, leaving a deficiency of £603. The case, being a summary one, was left with the Official Receiver as trustee. The following are creditors:—

	£		£
Bankers	69	Lundberg, A. P., & Sons ...	44
Belbin & Bowden, Ltd.	29	Mawdsleys, Ltd.	20
Burrow, A. H.	321	Strong, H. O., & Sons, Ltd. ...	30
General Electric Co., Ltd. ...	46	Siemens & English Electric Lamp	
Golding, Howell & Co., Ltd. ...	30	Co., Ltd	33

F. WILLIAMS, Gradua Works, Porthcawe Road, Sydenham, trading as Lowther & Co., engineer.—The application for discharge of this debtor was heard recently at the Court House, Greenwich. The Assistant Official Receiver said that the receiving order was made in 1922, and proofs lodged totalled £23,521. The assets were estimated to realise £35 965, being principally made up of certain foreign patent rights. The estate, however, produced comparatively little, and no dividend had been or could be paid to the unsecured creditors. On behalf of the debtor it was stated that debtor's position had been brought about by anticipating the sale of certain patent rights and arranging his finances as if those sales had actually taken place. The judge commented on the fact that debtor had traded for three years after he was aware of his position, and the discharge was granted subject to a suspension of five years.

H. HALL, 26, Egerton Street, late 6, Market Place, and Albert Chambers, Blackburn Street, all Radcliffe, Lancs., radio dealer.—The public examination of this debtor was held recently at the Court House, Bolton. It appeared that in February, 1924, he started business in Radcliffe as a radio dealer, trading as the Central Wireless Co., but this was not a success. In 1921 he was appointed an agent by a firm of moneylenders and clothing club proprietors. His present deficiency amounted to £1,127. The examination was closed

B. G. THOMPKINS, radio engineer, Armstrong's Buildings, Stanley, Co. Durham.—Receiving order made March 13th, on debtor's own petition.

C. BINNS (United Electric Co.), electrical engineer, 55, Low Briggate, Shipley, Yorks.—Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford, released, March 15th.

G. W. RIDLEY, electrical engineer and contractor, 1, Alfred's Court, Chorley.—First and final dividend of 1s. 6½d. in the £, payable at the Official Receiver's offices, 11, Winckley Square, Preston.

W. S. MILES, radio engineer, Roslyn, Worston Road, Burnham-on-Sea.—Receiving order made March 12th, on debtor's own petition.

W. N. SMART, electrician, late of 17, 19, and 19a, Cross Street, Oldham.—First meeting, March 30th, at the Official Receiver's offices, 11, Winckley Square, Preston; public examination, April 14th, at the County Court House, Blackburn.

G. YOULL and A. FRASER (Youll, Fraser & Co.), electric lamp and wireless factors, 6, Hunter Street, Liverpool.—First meeting, March 26th, at the Official Receiver's offices, 11, Dale Street, Liverpool; public examination, April 27th, at the Court House, Liverpool.

H. TIDSWELL (H. Tidswell & Co.), electrical engineer, 11, Bazaar Street, Pendleton.—First meeting, March 26th, at the Official Receiver's offices, Byrom Street, Manchester; public examination, April 15th, at the Court House, Salford.

G. R. SPARROW, electrical engineer, 11, Cloudesdale Road, Balham.—First meeting, March 30th, at 29, Russell Square, W.C.; public examination, April 8th, at the Court House, Wandsworth, S.W.

E. O. HENSTOCK, electrical engineer, 21, Old Road, Brampton, Chesterfield.—Last day for proofs for dividend, March 31st. Trustee, Mr. L. A. West, Official Receiver, 4, Castle Place, Nottingham.

W. R. GRIGSBY (Wenham Lighting Corporation), electrical factor, late of 184, Gray's Inn Road, W.C.—First and final dividend of 4s. 6d. in the £, payable at the offices of Messrs. Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C.1.

Company Liquidations.—FOSTER CONSTRUCTION CO., LTD., constructional, electrical and general engineers, 60, High Street, Plaistow, E.—The statutory first meetings of the creditors and shareholders of this company (in compulsory liquidation) were held last week at Carey Street, W.C. The Official Receiver said that the company was incorporated in December, 1914, with a nominal capital of £5,000, in shares of £1 each, afterwards increased to £40,000, and it was formed for the purpose of acquiring from Walter and Arthur Foster the business of constructional and electrical engineers and general contractors, which they had conducted under the style of W. Foster & Son at Stratford, E. The issued capital amounted to £17,697, of which £14,197 had been allotted for cash, and £3,500, as fully paid in part satisfaction of the purchase consideration. The statement of affairs filed disclosed liabilities of £16,943, of which £4,896 was expected to rank, and assets of £4,100. The latter were, however, subject to deductions of £630 for preferential payments and £2,316 in respect of loans on debentures, and a deficiency of £3,742 was accordingly disclosed with regard to the creditors. In relation to the shareholders a total deficiency of £21,189 was shown. The liquidation was left in the Official Receiver's hands.

DUTTONS (SOUTHPORT), LTD., car and electrical engineers, 6, Wright Street, Southport.—A meeting of creditors was held recently, at the offices of Messrs. Davies & Crane, C.A., Southport. A statement was presented showing the financial position of the company at the date of the liquidation, as far as it had been possible for the liquidator to ascertain it. The statement disclosed liabilities of £1,973, and net assets of £753, leaving a deficiency of £1,220. The shareholders passed resolutions for voluntary liquidation on February 11th last. The matter was discussed, and it was decided to confirm the voluntary liquidation of the company with Mr. J. A. Bond, C.A., of Hoghton Chambers, Southport, as liquidator.

COAL, GAS & ELECTRIC INVESTMENT, LTD.—Winding up voluntarily. Liquidator, Mr. P. B. Gilroy, College House, Little College Street, E.C.4. Meeting of creditors at College House on March 26th. Particulars of claims to the liquidator by April 30th.

PRICE'S BATTERY & RADIO CO., LTD.—A meeting of creditors was called for March 23rd, at Charing Cross Hotel, W.C.

Private Arrangements.—W. H. Agar, 19, Whitecross Place, E.C., electrical and radio dealer.—A meeting of creditors was held recently, when a statement of affairs was presented which showed liabilities of £968, all due to unsecured creditors. The assets totalled £202. The debtor commenced business in 1922 with very little capital, but he traded successfully until October last, when he met with an accident. The present position was attributed to that accident and loss on the manufacture and sale of radio boxes and advertising expenses. It was stated that two of the principal creditors had obtained judgment, and as there was no offer of composition forthcoming it was resolved that the debtor be requested to execute a deed of assignment in favour of Mr. Charles Latham, 78, New Oxford Street, as trustee, with a view to immediate realisation. The following are creditors:—

	£		£
Gregory, A. E.	29	Siemens & English Electric Lamp Co., Ltd.	95
Liverpool Electric Cable Co., Ltd.	60	Standard Electric Co.	230
Harris, G. F. & G.	42	Grafton, Walter, & Sons	33
Hart Accumulator Co., Ltd. ...	36		
Siemens Bros. & Co., Ltd. ...	85		

Dissolutions of Partnership.—Cinema & Electrical Equipment Co., suppliers of kinematograph outfits and electrical engineers, 5, Great Newport Street, W.C.2.—Mr. E. H. Hamilton and Mr. R. P. Eddy have dissolved partnership. Mr. Hamilton will attend to debts.

A. R. Camidge & Co., electricians, 11, Church Street, Stoke Newington, N.16.—Mr. A. R. Camidge, Mr. B. Winters, and Mr. W. A. Dallender, have dissolved partnership. Messrs. Camidge and Winters will attend to debts and continue the business under the same style.

The Threatened Engineering Lock-out.—By the eleventh-hour decision of the employés of Messrs. R. Hoe & Co., Ltd., to return to work, the threatened lock-out in the engineering industry was averted towards the end of last week. Upon the unions giving an undertaking that the men would resume on Monday last, the employers cancelled the notice which was to have taken effect on Friday, March 19th. It is understood that the question of wages will now be dealt with in connection with the application of the London executives of the unions concerned for an all-round increase in the rates paid in the London area.

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. report, March 23rd:—Copper (electrolytic) bars, £66 5s., 5s. inc.; ditto ditto sheets, no change; ditto ditto wire rods, £76 5s., 5s. inc.; ditto ditto h.c. wire, no change.

Messrs. James & Shakespeare report, March 23rd:—No change in the prices of copper bars (best selected), sheet and rod; English pig lead, £33, 5s. inc.

Messrs. Edward Till & Co. report, March 23rd:—India-rubber, Para fine, 2s. 5d., 2½d. inc.

Col. Willey on Industrial Needs.—The speech delivered by Col. F. V. Willey at the annual general meeting of the Federation of British Industries last week, upon his relinquishing the presidency of the Federation, contained constructive suggestions upon a variety of matters connected with industry. He said that there appeared to be a tendency for Great Britain to change over from being an exporting nation to one in which the internal trade was more important. The transition period was likely to be a very critical one. There was scope for an "economic general staff" co-ordinating the needs of industry, the capacity of finance and the aims of diplomacy. The highest incentive should be given to effort and that postulated an extension of the principle of payment by results. The F.B.I. had appointed an influential committee to explore the possibilities of increased industrial efficiency. Industrialised countries were progressing to greater collective organisation, and this country would have to keep in step with that world-wide tendency. Col. Willey's suggestions for the elimination of waste (including waste of effort) covered standardisation and the direct distribution of goods from producer to consumer. Action by both employers and employed was necessary, and the speaker said that there was a greater need for young men in industry, who would work freed from misleading tradition. Prosperity would be hastened by keeping in the forefront the ideal of service to the consumer.

For Sale.—Messrs. Girlings, Ltd., of Maldon, Essex, have for disposal one 50-h.p. and one 40-h.p. Crossley suction gas engine, several 105-V dynamos, battery-charging booster, switchboard, &c. Messrs. H. Butcher & Co. will sell by auction on April 15th, at the Strode Engineering Works, Herne, Kent, miscellaneous electrical stores, lighting sets, batteries, cables, &c. Plymouth Corporation Electricity Department invites offers for surplus generating plant. Eccles Corporation Electricity Department has for disposal one 40-kW steam-driven generating set. (See our advertisement pages to-day.)

The Functions of the Commercial Diplomatic Officer.—In a recent address before the British Empire Chamber of Commerce in the United States, Capt. A. J. Pack, Commercial Secretary in New York, answered the often-asked question: "Of what use is a commercial diplomatic officer?" He outlined the duties of commercial counsellors and secretaries attached to embassies, and pointed out that their work in no way overlapped that of the consular officials. While the duties of the latter were local and detailed, the commercial diplomatic officer's were central and general. It was his business to investigate and report in detail upon special subjects or to compile general reports upon the financial, industrial or commercial conditions of the country to which he was accredited. In this work he was assisted by the consular officers with their more detailed knowledge. In conclusion, Capt. Pack said that a British trader in a foreign country could best answer the question for himself by putting his problems before the commercial diplomatic officer at the embassy, when all possible assistance would be rendered.

French Electrical Imports and Exports.—The following table shows the French imports and exports of electrical machinery and apparatus during the past two years, the franc having been taken at 133 to the £:—

	Imports.		Exports.	
	1925.	1924.	1925.	1924.
	£	£	£	£
Insulators, porcelain, parts, &c.	22,320	60,830	66,160	76,300
Incandescent lamps ...	388,300	339,000	260,000	224,630
Dynamo electric machines and parts ...	367,640	367,740	550,300	453,290
Electric and electro-technical apparatus ...	422,600	411,060	1,400,000	1,522,200
Insulated wires and cables	58,800	26,820	170,000	395,460
Arc lamps and parts ...	1,000	235	—	—
Armatures and other parts	142,850	134,850	227,160	184,150
Accumulators and parts	45,300	27,650	75,030	48,980
Dry batteries	950	910	19,900	19,880
Total ...	£1,449,760	1,369,095	2,768,550	2,924,890

Electrical Trades Commercial Travellers' Association.—This Association held the last of its social functions of the season at the Manchester Hotel, Aldersgate Street, on March 20th. The function took the form of a carnival dance and was well attended. During the interval refreshments were served, and Mr. E. A. Joyce, the chairman of the Association, in a witty speech suggested that an outing on the Thames might possibly be organised during the coming summer. Fantastic hats and streamers were distributed in profusion during the evening, and Tom Daly's orchestra was equal to all demands. The thanks of all who were present are due to the entertainment secretaries, Mr. L. Moir and Mr. J. M. Woolnough, for organising a thoroughly enjoyable evening.

Book Notices.—"The Divine Mechanism: The Christian Creed Reconsidered in Terms of a Theory of Mechanistic Universal Mind," by the late J. M. M. Munro, F.R.S.E., M.I.E.E. Pp. 73. Edinburgh: Macniven & Wallace. Price 2s. 6d.

"Specifications *Do* Count." Pp. 21; 10 figs. London: Delco-Remy & Hyatt, Ltd.—This excellently-printed booklet is in no way an instruction book; as is pointed out in the foreword, it is descriptive of a coil-ignition system as supplied to date for more than 7½ million motor vehicles, and its issue has been prompted by the makers' desire to show that this method of ignition "is every bit as reliable as other forms." With reference to the prevalent idea that coil ignition is a drain on the battery, the information on battery performance is given, and the advantages claimed for the Delco-Remy system are fully set out.

"The Port of Southampton: Its Past, Present and Future." By Brig.-Gen. the Hon. Everard Baring (pp. 14, ill.). Reprinted from *Brassey's Naval and Shipping Annual*, 1926, and published by the Southern Railway Co. (Docks and Marine Departments).

"The Secret of High Wages." By Bertram Austin, M.B.E., M.A., and W. Francis Lloyd, M.A., A.M.I.E.E. Pp. iii. London: T. Fisher Unwin, Ltd. Price 3s. 6d. net.

"*Journal* of the Institution of Electrical Engineers." Vol. LXIV. March, 1926. No. 351. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

New Italian Companies.—Among the new electric lighting and power supply undertakings recently formed in Italy are the Società Impresa di Elettricità U. Sampietro, of Trento, capital 1,500,000 lire; La Società Pinerolese di Elettricita, of Pinerolo, capital 2,000,000 lire; La Società Idroelettrica Sile, of Treviso, capital 100,000 lire; and La Società Idroelettrica Dolomiti, of Rome, capital 1,000,000 lire.

Among the new electric traction undertakings recently organised is the Società Ferrovie Elettriche Abruzzesi, of Rome, capital 100,000 lire.

Electrical Contracting Notes.—We learn that as the result of an Electrical Contractors' Association meeting held in Leeds recently, ten applications for registration were received. In current E.C.A. provincial reports several references are made to the need to relieve indentured apprentices from the fruitless burden of unemployment insurance. We understand that friendly discussion is taking place in Liverpool between the Corporation electrical engineer and the local E.C.A. Branch, concerning the price paid by the Corporation for "cooker wiring." The E.C.A. Liverpool Branch reports that the Birkenhead Corporation is acting as consulting engineers and charging 5 per cent. on the amount of the contract. The Newcastle E.C.A. Branch has prepared a battery-charging price list suitable for overprinting for private use. It is stated that the Dublin E.C.A. Branch is disturbed at the drastic regulations issued by the Dublin Corporation prohibiting the erection and use of any flashing or moving sign. We learn that it is hoped to establish a new E.C.A. Branch at Halifax embodying the membership of the Halifax Electrical Employers' Federation. The E.C.A. Bournemouth Branch notes with satisfaction the proposal to co-operate with finance corporations in dealing with goods on hire or hire-purchase.

Lead.—Messrs. James Forster & Co. reported on March 20th that supplies of lead in this country were plentiful enough, and as, according to Metal Exchange figures, shipments during February from Burma and Australia showed an increase of about 6,000 tons over the shipments in January, there appeared to be little likelihood of a shortage, at all events during April. The Board of Trade returns for February were :—Imports, 22,632 tons; exports, 1,329 tons; leaving for Home consumption 21,303 tons.

Patents in Paraguay.—The Government of Paraguay has passed a Patent Law—the first to be applied in the country. Patents are to be granted for a term of fifteen years, and an annual fee of 5 gold pesos is to be paid in respect of them. The law provides that inventions known in Paraguay prior to the passing of the law shall not be patentable.

Belgian Exhibition of Electrical Plant.—An exhibition organised by the Association of Belgian Manufacturers of Electrical Plant was opened on March 11th at the Colonial Office, Brussels.—*Reuter* (Brussels).

Conditions in China.—The F.B.I. correspondent in China says that the disturbed state of the country naturally precluded any considerable development of electric power during 1925. The principal extensions reported were at Chungking and Pootung, while an important order was placed in connection with the Harbin Tramways. These contracts were all secured by Continental manufacturers, but an order for a small plant for a town near Changsha in Hunan Province was placed with a British firm. A number of orders for small oil engines and suction gas plants for lighting small towns and villages formed a feature of the trade as usual. The formation of a lamp combine is directed towards eliminating the price-cutting which has been a marked feature in this line for some time; the combine succeeded during the year in raising the price for lamps from $10 to $30 per 100. As regards other electrical accessories, considerable competition from locally-manufactured goods has been encountered by importers of fans, and American makers have reduced their prices. A brisk demand for electric conduit has been supplied chiefly by British firms. Great Britain has provided the higher grades of cable, Germany and Japan the cheaper; while bells, switches, current limiters, &c., have come chiefly from Germany. America enjoys a good trade in fittings, heating appliances, dry cells, flashlights, &c.

Canadian Electrical Industries.—A survey of Canadian industries shows that the production of electricity was seventh in importance in 1923, the output being valued at over $91,000,000. The manufacture of electrical apparatus was thirteenth in the list, with a production valued at $51,360,000. Pulp and paper production was the Dominion's leading industry, and this is a large producer and user of electric power. It is noteworthy that gas lighting and heating was the least important of the 40 leading industries, with a production valued at $19,605,000.

Calendar.—We have received from the University Engineering College, Westgate-on-Sea, a neat self-opening pocket diary and notebook for 1926, containing particulars of the U.E.C. courses of correspondence tuition.

The Contractors' Register.—The annual meeting of the National Register of Electrical Installation Contractors was held on Monday last. Pressure upon our space compels us to defer an extended report until our next issue.

New Offices and Showrooms.—MESSRS. PHILIPS LAMPS, LTD., have recently opened new headquarters at 145, Charing Cross Road, W.C.2 (the Oxford Street end). The premises consist of four floors, the first three of which are mainly devoted to storage, each having an area of about 8,000 sq. ft. On the ground floor a showroom has been arranged. Here there is shown a full range of Philips products as well as "Metalix" X-ray equipment. The trade counter is on this floor and at the rear is a large garage. The company now has ten branch offices and distributing depôts in this country.

Danish Industrial Fair.—*Reuter* reports that the Danish Industrial Fair was opened at Copenhagen by the Prime Minister of Denmark on March 13th. The fair is housed in what is said to be one of the largest buildings in Northern Europe, and it is reported that every available inch of space was booked well in advance.

Australian Import Duties.—At a recent inquiry by the Australian Tariff Board into an application by Australian manufacturers for the imposition of an increased duty on imported telephone apparatus, Mr. L. P. R. Bean refuted a statement by an official of the G.P.O. that Australian telephone apparatus was inferior to imported appliances. He also denied that Australian manufacturers were incapable of carrying out certain work as had been stated by a representative of Messrs. Siemens Bros. & Co., Ltd.

Among the recent decisions of the Commissioners is the following :—Insulators, composed of resin and mineral or other fillers (as a substitute for porcelain insulators) : 25 per cent. under the British preference tariff; 30 per cent. under the intermediate tariff; and 50 per cent. under the general tariff.

Cement Works Electrification.—Speaking at the recent annual meeting of the British Portland Cement Manufacturers, Ltd., the chairman (Mr. P. M. Stewart) said that during the current year they hoped to scrap the steam plant at their Martin Earle works and replace it with electrical plant.

New French Company.—A company has lately been formed at Rodez in the Department of Aveyron with a capital of 664,700 fr. and the title La Société d'Electricité Rurale Lescure-Jaoul, to establish a plant to utilise the water power of the Jaoul Falls.

Municipal Trading in Australia.—In our issue of March 12th (p. 419) we quoted a manifesto issued by the Electrical Employers' Association (Sydney) against the proposal of the Sydney City Council to open showrooms for the exhibition and sale of electrical appliances. The Sydney *Daily Telegraph* reports a statement by the Lord Mayor, in reply to this manifesto, in the course of which he said :—"It is my intention that the business of the City Council's Electricity Department shall be increased by placing within the reach of every one of the Council's customers high-class domestic electricity-consuming apparatus, by selling it at the minimum of profit. I propose that this apparatus shall be installed and set to work at the minimum of cost to the customer and that minor repairs shall be carried out free of cost by the crews of demonstration trucks engaged in the sale of electrical appliances. Under the present scheme of purchasing electrical apparatus from private firms, the interest of the seller ceases with the sale. In the case of the sale of apparatus by the Council, interest in the welfare of the apparatus would never cease, because it is to the Council's advantage to keep electricity-consuming apparatus always in usable condition, so as to increase the sales of electrical energy."

Boiler Contracts.—MESSRS. YARROW & CO. (1922), LTD., state that they have recently received a further order for boilers of the latest Yarrow patent water-tube land type, for the County of London Electric Supply Co.'s station at Barking. In addition to this the company has now on order, and going through its boiler shop, Yarrow boilers for Portsmouth Dockyard, Messrs. Michael Nairn, the City of London Electric Light Co. (Bankside), and the London Electric Supply Corporation, Ltd. (Deptford), as well as two high-pressure marine boilers of 550 lb. pressure.

New Chilean Company.—Silva y Taulis, Ltda, is the name of a new concern which has lately been formed in Santiago with a capital of $30,000 to manufacture accumulators.

Lighting and Power Notes.

Ashton-under-Lyne.—NEW PLANT.—The Town Council has applied to the Electricity Commissioners for sanction to a loan of £77,126 for the installation of an additional 6,000-kW turbo-alternator with the necessary boilers, cooling towers, and other accessories.

Australia.—LITHGOW.—According to the Sydney *Daily Telegraph*, it is expected that the work of building a power house for the Railway Commissioners near the State coal mine at Lithgow will be commenced shortly. It is planned that the initial plant shall comprise two sets of 2,500 kW each. The Commissioners hope to have the first unit ready in from 12 to 15 months' time. The main purpose of the scheme will be to supply power to the State coal mine, but electricity will be supplied also to local bodies for the Lithgow district and elsewhere on the mountains. The initial stage, it is stated, will cost less than £100,000. Development of the power house will be limited by local conditions, but eventually power may be supplied for an electrified mountain train service.

Basingstoke.—LOAN.—The Town Council has applied to the Electricity Commissioners for sanction to a loan of £11,350 for the installation of an additional 410-kW Diesel generating set.

Bedford.—LOANS.—The Electricity Committee is to apply for sanction to further loans of £7,000 for meters and £5,000 for electrical apparatus.

EXTENSION OF SUPPLY.—The Committee has recommended the laying of underground cables for the supply of electricity to Sandy and Polton at an estimated cost of £18,000.

Chelmsford.—ELECTRICITY AGREEMENT REJECTED.—At a meeting of the Town Council on March 11th, the question of an agreement with the Electric Supply Corporation, Ltd., to take over the electricity supply in the borough was considered. The Committee reported that the draft agreement submitted by the company provided for a supply of electricity in the borough for 42 years, at the end of which period special terms were outlined for the taking over of the undertaking by the Council. It was decided to inform the company that the Council did not intend to support its application for a new Order extending its powers as undertaker for an additional 42 years.

Continental.—BELGIUM.—At the recent annual meeting of the Société d'Electricité des Ardennes, it was reported that in the northern section the distribution mains have been linked up with a number of quarries, while in the southern section the provincial authorities of Luxembourg are extending the distribution mains a distance of about 30 miles, which will enable a supply to be given to additional villages in the Bastogne district.

Italy.—The Società Elettrici Trevigiana is erecting a 10,000-V transmission line between Treviso (province of Carita) and Paderno. A 150,000-V line is also being established to connect the Silani hydro-electric station at present in course of construction with the towns of Bari and Taranti by the Società Forze Idrauliche della Sila. The line will pass through six provinces.

Jugo-Slavia.—The Municipality of Belgrade has accepted in principle the offer of a Swiss group of a loan of 5,500,000 Swiss francs for the construction of a power station in Belgrade.—*Reuter* (Belgrade).

Germany.—According to *Commerce Reports*, a hydro-electric scheme is proposed by utilising the water of the rivers Our and Irsen on the frontier between Luxemburg and Germany. This scheme calls for the erection of a dam 348 ft. high, which would create a lake about 13 miles long and one mile wide between Stolzembourg and Ouren. The enterprise would be on a larger scale than any now existing in Europe. It is proposed that the capital shall be raised jointly by the district of Bitburg, the Allgemeine Elektricitäts Gesellschaft, and the German Reich.

Austria.—Plans have been prepared for the installation of a new 30,000-h.p. steam turbine and 25,000-kVA generator at the Vienna municipal central electricity station at Semmering. The necessary steam will be provided by four new boilers utilising pulverised fuel, which are also to be installed. When the new plant is installed the old plant will be kept as a reserve for use in periods of excessive demand or temporary stoppage of the main set.

Elgin.—Purchase of Shares.—The Town Council has purchased the 3,543 £1 shares held by Messrs. Edmundsons Electricity Corporation, Ltd., in the Elgin Electric Supply Co., Ltd., with a view to taking over the electricity undertaking.

Gainsborough.—Electricity Supply.—At a meeting of the Urban District Council, on March 15th, the Electricity Committee recommended that application be made for sanction to borrow £32,000 required in connection with the electricity scheme for the district. It was suggested that as the Council was to supply electricity to tradesmen and others along the line of cable, it should extend the scheme to supply others and that sanction should be sought to borrow an additional £20,000 for this purpose. It was also proposed that householders should be supplied on the hire-purchase system. It is understood that the Council will be able to supply at 10d. per kWh, and that electricity can be installed at a cost of £5 per house. The Electricity Committee's recommendation was adopted.

Glasgow.—Progress During February.—The Corporation electricity manager reports that 150 houses were wired during February, bringing the total to date to 1,963, while the number of applications for the hire of appliances during the month was 198, bringing the total to 10,017.

High Wycombe. — Price Reduction. — The Wycombe (Borough) Electric Light & Power Co., Ltd., has reduced the charge for electricity for lighting to quarterly consumers from 9½d. per kWh for the first 100 kWh per quarter and 9d. beyond, to 9d. and 8d. respectively.

Hull.—New Electricity Charge.—The electrical engineer, in a report on the domestic tariff, recommends a uniform primary charge of 15 per cent. on the current assessments, with a minimum of £2 5s. per annum for houses rated at £15 or under, and a secondary charge as at present of ¾d. per kWh, the primary rates in added areas being amended correspondingly, namely, Hessle and Sutton 17½ per cent., and Ferriby 20 per cent., with minima of £2 12s. 6d. and £3 respectively.

Irish Free State.—Dublin.—The Dublin City Commissioners have announced a further reduction in the charges for electricity. As from April 1st the charge for lighting in private dwellings will be reduced from 7d. to 6d. per kWh. There will be an all-round reduction of 20 per cent. in the charges for meter rents, and also a reduction of 25 per cent. for electricity registered by slot meters. These reductions are equivalent to a revenue of £60,000 a year.

Bray (Co. Wicklow).—At the instance of the Ministry of Industry and Commerce, a local inquiry was held recently by Messrs. Fred. J. Allan and Michael O'Ryan, B.E., in the Town Hall, into the application recently lodged by the Urban District Council for sanction to raise a loan of £13,000 to meet additional expenditure on the electricity undertaking.

Lichfield.—Electricity Charges.—In connection with the electricity supply for the town the Town Council has adopted the following charges for electricity:—Lighting, 6d. per kWh, prepayment meters, 7d. Power, heating, and cooking, 2d. per kWh. Industrial power, first 150 kWh per quarter per kW of maximum demand, 2d. per kWh, next 150 kWh, 1¾d., beyond, 1½d. Combined rate for lighting, heating and small power, private houses, a fixed quarterly charge equal to 5 per cent., of the net rateable value for the first £30, plus 2½ per cent. of the rateable value over £30, and a flat rate of 1d. per kWh for all electricity used.

London.—Price Reductions.—The County of London Electric Supply Co. announces that from the March meter readings, a further reduction of 10 per cent. will be made from the percentage increases at present in force on the Company's rates for supply.

Mid-Cheshire.—Electrical Development.—Pending the completion of the works necessary to receive the larger bulk supply from the Mersey Power Co. through the North Wales Power Co.'s recently completed line, the Mid-Cheshire Electricity Supply Co., Ltd., is obtaining electricity from the Salt Union's Winsford plant. The erection of new h.p. mains for the Mid-Cheshire Company, to connect Northwich to Knutsford, Middlewich and Winsford, and the sub-stations for these towns, will be completed within the next few weeks. Distributing mains have been laid in the three towns. A central showroom is being opened at Knutsford. The annual report of the Mid-Cheshire Electricity Supply Co. states that a large number of new buildings are being erected throughout Mid-Cheshire, and almost without exception these are being equipped for electricity. There is a general movement to close down private plants and to change over to the company's supply. The year's net profit is £8,036.

Mid-Lancashire. — Electrical Development. — Municipal electrical engineers of local authorities in the area covered by the Mid-Lancashire Electricity Board met at Blackpool recently. An application was received from Fleetwood for sanction to the erection of a new turbine. It was decided to recommend that the application be granted owing to the isolated and peninsular position of the Fleetwood generating station in relation to Preston. The electrical development of the southern portion of Fleetwood area, however, is to be met by a bulk supply.

Minehead.—Extension of Supply.—The Minehead Electric Supply Company proposes to apply for an Order to supply electricity throughout a large part of West Somerset, extending as far as Williton and Watchet, some eight miles distant from Minehead. The Williton Rural District Council is supporting the scheme, and facilities will probably also be granted by the Watchet Urban District Council.

New Zealand.—Hydro-Electric Development.—According to the Sydney *Daily Telegraph*, an announcement has been gazetted that licences have been granted to Gerald Fitzgerald and others to use for electrical power production purposes water from the falls, or streams, discharging into Deep Cove, or any other part of Smith Sound and Lake Manapouri. The Smith Sound scheme is expected to yield 50,000 h.p., and the lake 250,000 h.p. The principal object of the scheme is to manufacture nitrates. A proposal to establish such works at Milford Sound two years ago aroused public opposition, on the score that it would destroy the scenic beauties. The present scheme replaces the previous scheme.

Nelson.—According to the *Electrical Engineer of Australia and New Zealand*, the growing demand for electrical energy in the city and environs of Nelson necessitates the provision of further generating plant in the near future, and steps are being taken, on the advice of the chief electrical engineer of the Public Works Department, to form a power board to deal with the matter. The board will consist of representatives of the Nelson City Council, the boroughs of Waimea, Richmond and Motueka, and the town of Tahunanui. One proposal is the development of hydro-electric power from Lake Rotorua some 60 miles from the city. The maximum power available from this source is 45,000 kW. If the necessary steps are taken to proceed with the scheme, electricity will be available in 1928.

Perth.—Loan.—The Town Council is applying for sanction to the borrowing of £20,888 for electricity purposes.

Preston.—Loans.—The Town Council has received sanction to the borrowing of £50,257 for the installation of additional generating plant at the Ribble power station, and £7,108 for additional converting plant.

Application is to be made for powers to borrow £13,970 for a 6,600-V overhead cable from the Ribble Station to Longton, Walmer Bridge, New Longton, &c., together with the necessary distributors.

Salford.—Gas *v.* Electricity.—According to the *Manchester Guardian*, with a view to dealing with the smoke evil, the Health Committee is making provision for the consumption of gas or electricity in the dwellings that are now being erected on the Littleton Road Estate. The Committee is to visit a block of completed flats and houses in which gas and electricity have been installed for lighting, heating, and cooking purposes. After tests have been carried out a decision will be made as to whether gas or electricity is to be installed in the 64 flats and 62 houses which comprise the last building scheme.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following:—The West Gloucestershire Power Co., Ltd., for the supply of electricity to certain parishes in the rural districts of Tetbury, Cirencester, Chipping Sodbury, Thornbury, and Warmley; the Clayton Urban District Council, for the supply in the urban district; the North Metropolitan Electric Power Supply Co., in the urban district of Epping, and certain parishes in the rural district of Epping; the Horley and District Electricity Supply Co., Ltd., in certain parishes in the rural districts of Burstow and Godstone; the West Ham Corporation, for the supply of electricity in bulk to the East Ham Corporation, and the Ilford Urban District Council; the Great Yarmouth Corporation, for the supply of electricity in the rural districts of East and West Flegg, and Mutford and Lothingland, and certain parts of the rural districts of Blofield, Loddon and Clavering, Smallburgh, and Wangford.

Sunderland.—MAINS EXTENSIONS.—The Corporation is to extend the mains in the Ettrick Grove district at an estimated cost of £1,842.

Swansea.—MAINS EXTENSIONS.—The Corporation Electricity Committee has decided to carry out mains extensions at a cost of £11,000.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—*Power* reports that the first unit of the Bartlett's Ferry hydro-electric plant of the Columbus Electric & Power Co. has been put in operation, and the second unit will follow it shortly. The first unit is furnishing 20,000 h.p. and three other units are to be installed, bringing the total capacity of the plant up to 80,000 h.p. The total cost of the project, when completed, will be $7,000,000.

The Federal Power Commission has issued the licence covering the development of Conowingo Falls on the Susquehanna River. Under the terms of this licence the construction of this project, expected to cost $52,000,000, can be begun at once. The scheme provides for the development of 300,000 h.p.

Walton-on-Thames.—ELECTRICITY IN BULK.—The Urban District Council has received from the Metropolitan Electric Supply Co., Ltd., an offer of a bulk supply of electricity at not over £4 10s. per kW, plus 0.5d. per kWh.

Wirral.—LOAN SANCTION REFUSED.—The Rural District Council, which had applied to the Electricity Commissioners for sanction to borrow £180,000 for an electricity scheme, has now been informed by the Electricity Commissioners that they cannot give consent. The Council proposed to obtain bulk supplies from the Wallasey Corporation and the Mersey Power Co. and distribute in all parts of the Wirral Peninsula. The Commissioners pointed out that the proposed scheme did not appear to be an economical method of developing the district on account of the loss of the anticipated bulk supply to the Hoylake Urban District Council and the closing down of the Wirral colliery. The estimates of revenue were unlikely to be realised for some years to come. Furthermore it was unlikely that the scheme would rank for financial assistance from the Unemployment Grants Committee. The Commissioners suggest that the Council should reconsider the matter with a view to formulating and submitting modified proposals. At a recent meeting the Council appointed a deputation to interview the Commissioners.

Tramway and Railway Notes.

Accrington.—NEW CARS.—The Tramways Committee has decided to purchase two top-covered double-deck tramcars for use mainly on the Oswaldtwistle section of the system.

Australia.—RAILWAY ELECTRIFICATION.—According to the *Electrical Engineer of Australia and New Zealand*, the Victorian Railways Standing Committee has approved of the extension of electrified service from Eltham to Hurstbridge. The work will involve the conversion of 6¾ miles of main track and nearly a mile of sidings, and the erection of a 1,000-kW automatic sub-station at Diamond Creek. The total cost is estimated at £51,303.

MELBOURNE.—The work of converting the Melbourne cable tramway system to electrical operation is making good progress, and the first electric cars were run on one section recently.

Continental.—FRANCE.—Rapid progress is being made with the electrification of the Culoz-Modane section of the Paris, Lyons and Mediterranean railway. It has been arranged that the necessary energy for the operation of the line shall be taken from the power station of the Société d'Electrochimie et Electrométallurgie d'Ugine.

FRANCE.—It is reported that the Paris municipal authorities have entered into negotiations with the Nord-Sud underground railway concern with reference to the purchase of the line in the near future instead of in 1931, as provided for in the concession.

SWEDEN.—The first train on the newly-electrified Stockholm-Gothenburg railway was recently run between Hallsberg and Katrine, the distance of 40 miles being covered in 34 minutes.

Dundee.—TRACK RENEWALS.—The Tramways Committee has recommended to the Town Council that the tramway track on the Downfield route be renewed at an estimated cost of £10,000.

London.—MORDEN TUBE PROGRESS.—Of the 14½ miles of permanent-way which is being laid between Clapham and Morden about a half has now been completed. Some 87 new cars will be required for operating the services, and the majority of these have already been delivered from the makers. The majority of these cars will be housed at the new depôt which lies beyond the terminus at Morden, and is now practically completed. It comprises five bays and 20 inspection pits and will accommodate 140 cars. The opening of the Morden extension will necessitate the employment of 400 additional men for the operation of the trains, staffing of stations, the maintenance of the rolling stock, &c.

BREAKDOWN.—Owing to an electrical defect on the local down line of the Southern Railway between Charing Cross and London Bridge on March 22nd, the electric train services from Charing Cross were transferred *en bloc* to London Bridge. The defect occurred shortly after 7 p.m., and was remedied later, and before midnight normal services were in operation.

Middlesbrough.—LOAN SANCTIONED.—The Town Council has received the sanction of the Ministry of Transport to a loan of £26,000 for tramway track renewals.

Nottingham.—RAILLESS CARS.—Good progress is being made with the Corporation's scheme for the introduction of railless cars, and it is anticipated that services will be commenced in July.

Preston.—LOAN.—The Tramways Committee is seeking powers to borrow £1,250 for laying down an inter-lacing tramway line in Fishergate.

Telegraph and Telephone Notes.

Continental Telephony.—POLAND.—Direct telephone communication has recently been established between Prague and Warsaw and between Vienna and Warsaw.

BELGIUM.—Direct telephonic communication has also been established between Antwerp, Brussels, and Strasburg. The Belgian Post and Telegraph Authorities have also announced that a direct connection between Brussels and Basle will be established so soon as there is a sufficient demand for the service.

France.—RADIO-TELEGRAPH SERVICE.—A direct wireless-telegraph service has lately been established between France (Paris, Sainte Assise) and Buenos Aires.

Hawaii. — RADIO-TELEPHONY. — Recent experiments with radio-telephone communication indicate that it will do much towards breaking down natural inter-island isolation and will make easier the development of the small island areas. Pine-apple plantation managers on the island of Lanai are now in daily communication with their company's headquarters at Honolulu.

New Cable Ship.—THE "DOMINIA."—The *Dominia*, over 500 ft. long, and having a displacement of 18,000 tons on her summer load draught, the largest cable-laying ship yet constructed, was launched on March 16th, at the Neptune Yard, Walker, of Messrs. Swan, Hunter & Wigham Richardson, Ltd., for the Telegraph Construction & Maintenance Co., Ltd., London. The christening ceremony was performed by Lady Angela Campbell. The *Dominia* will be propelled by twin screws to give a speed of 13½ knots, her four cable tanks will carry over 9,000 tons, or more than 4,000 miles of cable. The cable equipment, made by the owners, is of the most improved type. The vessel's first undertaking will be the laying of a new Pacific cable, says *The Times*.

New Indian Ocean Cable.—SUCCESSFULLY LAID.—A new cable between Cocos, in the Indian Ocean, and Fremantle, Australia, a distance of 1,800 nautical miles, has been successfully laid. The operation was completed on March 15th, says the *Financial Times*, and the cable is the first of the new "loaded" type to be put down by the Eastern Associated group of cable companies, the owning concern being the Eastern Extension, Australasia & China Telegraph Co., Ltd. It was manufactured at Greenwich. The new cable is in duplication of the existing facilities, and will provide another route connecting Europe and Australia.

New Zealand.—NAVIGATORS AND WIRELESS.—New Zealand is a stormy coast, but the loss of life occasioned by wrecks, and the number of wrecks themselves to a certain extent, will in future be reduced, for all coast-wise ships must now be fitted with wireless sets, and all navigators who secure their master's or mate's certificates on these vessels will in future need to comply with the New Zealand enactment, which makes it a part of that examination to qualify as a "wireless signaller." On and after January, 1926, every candidate for a home trade certificate will be required to produce a certificate in the form of an examiner's authority, issued by the Minister of Telegraphs, to the effect that the candidate has passed some satisfactory examination as a wireless signaller. The examination provided by the Minister is not of a technical nature, but consists of a test of the candidate's practical knowledge and manipulation of transmitting and receiving apparatus, similar to that now required to be installed on all ships. The candidate is required to send and receive, for a period of five minutes each, at a speed of not less than ten words per minute, and will be required also to know something of the usual procedure between sea and land stations, and have a practical working knowledge of the regulations governing wireless signalling.

Turkey.—AUTOMATIC TELEPHONY.—The Turkish Government has lately placed a contract with an American company for the installation of an automatic telephone system in the city of Angora.

Venezuela.—TELEPHONE CONTRACTS.—The Government of Venezuela has signed contracts for the installation of two separate systems of automatic telephony. The first, to run for twelve years, will connect Caracas with a number of distant States and territories, and calls for the preliminary installation of 15,000 latest-type telephone instruments. The second contract, for fifteen years, covers a radius of 45 kilo-

metres and will link up the various towns in the State of Lara, with a total population of over 230,000. The Government will receive 10 per cent. of the gross receipts of the first and 5 per cent. of those of the second concessions.—*Reuter's Trade Service* (Caracas).

Radio Notes.

Australia.—High-Power Station.—The farmers' broadcasting station (2FC) at Sydney was to have its power (5 kW) doubled when it was moved from Willoughby to Pennant Hill, in February last.

Egypt.—Station Established.—A radio broadcasting station has recently been established in Cairo by a French company. It has a capacity of 2 kilowatts and works on a wave-length of 325 metres. So far as is known, this is the first station of its kind in Egypt.

S.B. Relays.—New Sub-station.—In connection with the system of relaying programmes to northern B.B.C. stations for which 2LS (Leeds) is the relaying headquarters for the North of England, Scotland and Ireland, a sub-relay station, to which all northern stations have been connected, was put into operation last week-end. New land lines have been laid recently, together with several new lines between Leeds and 2LO (London).

United States.—Libel Problem.—The Illinois State Attorney, Mr. Crowe, who has announced that he is filing a libel action against the wireless announcer at a Chicago cabaret for broadcasting an incorrect statement, has failed to find any statute in the American legal records defining radio libel. There is, however, says the *Daily Telegraph*, a law pending before the United States Congress enabling a libel action to be started for radio mis-statements and defamation of character.

Radio on American Farms.—There are nearly 1,000,000 radio sets on farms in the United States, according to estimates made by the Department of Agriculture, in a report on the increase in the use of radio in agricultural districts during the past five years. In some States, the Department says, there are radio sets on 25 to 40 per cent. of the farms. Estimates made by the Department showed 145,000 sets in use on farms in 1923, 365,000 sets in 1924, and 553,000 sets early in 1925. One station alone, in a period of three months' broadcasting of market and weather reports, received more than 3,000 letters of commendation from farmers, country banks, shippers of livestock, and small merchants in the towns of twelve agricultural States surrounding the station. The Department has made co-operative arrangements with more than 100 stations for broadcasting official market news gathered by the Department representatives in leading shipping and consuming areas. Since the beginning of the year the Department has made arrangements with about 60 stations to broadcast on a regular schedule four additional services dealing with general agricultural information.—*Reuter's Trade Service* (Washington).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Argentina.—Buenos Aires.—April 12th. Public Works Department. Rock-drilling installation, including steam shovel, aerial transporters, 170-h.p. electric generating plant, &c.*

May 3rd. Electric travelling crane, capacity 1½ metric tons.*

Department of Sanitary Works. May 26th. Two 1,000-kW Diesel-engine generating sets.*

May 27th. Electrically-driven centrifugal sewage pumps.*

Atherton.—March 31st. Electricity Department. 650 yd. .1 sq. in. l.p. cable. (See this issue.)

Australia.—Brisbane.—August 27th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator and two water-tube boilers, with economisers, draught plant, &c. Specifications (£5 5s.) from the offices of the company. Boundary Street, Brisbane.

Melbourne.—May 11th. P.M.G.'s Department. Telephone jacks.*

March 29th. State Electricity Commission of Victoria. 590 miles of aluminium steel-reinforced cable, various sizes, sufficient aluminium jointing sleeves for each size of cable, 2,000 lb. flat aluminium armour wire. (See this issue.)

June 16th. City Council. Turbo-alternator, exciter, and condensing plant.*

Barking.—April 20th. County of London Electric Supply Co., Ltd. Circulating-water pumps and pump-house equipment, circulating-water screening plant, and boiler-house and coal-handling plant. (March 19th.)

May 11th. Switchgear and accessories, transformers and piping equipment. (See this issue.)

Barnes.—Electricity Department. E.h.p. and l.p. cables. (March 19th.)

Basingstoke.—April 6th. Electricity Department. One 600-b.h.p. heavy-oil engine and direct-coupled dynamo. (March 19th.)

Belfast.—April 3rd. Electricity Department. One 1,000-kW rotary converter, with transformer, l.p., a.c. switchgear, &c. (March 12th.)

Belfast.—April 17th. Electricity Department. Automatic rotary converters with transformers, h.p. and l.p. switchgear and automatic control gear. (See this issue.)

Belgium.—Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels. March 31st. 80 tons of bronze wire in two lots. Particulars (Cahier des Charges Special No. 3-186) for one franc.

April 14th. Supply and laying of telephone-telegraph cables between Brussels and Liedekirke, and between Ruysselede and Aeltre-Sainte Marie. Particulars (Cahier des Charges Special No. 3-175) for 3 francs.

Brazil.—Rio Grande do Sul.—April 15th. Port and Bar Management. 10 electrically-operated portal cranes, capacity 2,500 kilos; 2 ditto, 5,000 kilos capacity; and 7 electric winches or capstans.*

Brentford.—March 30th. Board of Guardians. Wiring, &c., at the Institution, Warkworth House, Isleworth. (March 19th.)

Colwyn Bay and Colwyn.—April 8th. Electricity Department. Stores for 12 months, including cables, joint boxes, cut-outs, house-service meters, &c. (March 19th.)

Dover.—April 14th. Electricity Department. 6,250 yd. e.h.p. cable. (See this issue.)

Dundee.—April 20th. Education Authority. Electric lighting at new Central Advanced School at Blackness Road. Schedules from Messrs. Maclaren, Soutar & Salmond, architects, 16, South Tay Street, Dundee.

Edinburgh.—April 12th. Electricity Department. Four water-tube boilers, economisers, and mechanical stokers or alternatively, boilers, economisers, air heaters, and mechanical stokers, or boilers, economisers and powdered fuel plant. (March 12th.)

Egypt.—Cairo.—April 27th. Egyptian Government. 1,100 desk telephones. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, Westminster, S.W.1.

Erith.—March 27th. Electricity Department. 1,000 yd. (approx.) h.p. 3-core cable. (March 19th.)

Grimsby.—March 29th. Electricity Department. One 2,000-kW converter, one 1,000-kW ditto, l.p. switchgear, cable work, &c. (March 5th.)

Hallaton, Market Harborough.—Wiring and installation of electric lighting plant at Village Hall. (March 19th.)

Hazel Grove, near Stockport.—April 13th. Hazel Grove and Bramhall U.D.C. 2,300 yd. armoured cable. (March 19th.)

Halifax.—April 12th. Town Council. Wiring for electric lighting of 80 houses, Booth Lane and Nursery Lane. Particulars from Mr. P. Saunders, town clerk, Town Hall.

Horwich.—March 27th. Urban District Council. Wiring for electric lighting 206 houses, Hilton estate. Surveyor to Urban District Council, Public Hall, Horwich.

Huddersfield.—March 30th. Town Council. Electrician's work required in connection with the erection of workmen's dwellings, Woodhouse Hill, Fartown Green. Form of tender, &c., from Borough Architect, 26, Ramsden Street.

India.—April 19th. India Store Department. Goods lift for the Imperial Record Offices at Raisina, Delhi. (A.X. 2,904.)*

April 2nd. Cable. (March 5th.)

April 23rd. Electrical equipment for 15 motor coaches and 42 trailer coaches. (March 5th.)

May 7th. 15 motor-coach underframes and bodies, 30 motor bogie trucks. (March 12th.)

Leyton.—April 9th. Education Committee. Installation of electric lighting and central heating at the Sybourn Street new school. (March 12th.)

London.—Islington.—March 29th. Borough Council. Two 3½-ton electric refuse-collecting vehicles fitted with steel tipping bodies. (March 12th.)

Manchester. — April 6th. Electricity Department. 3-phase, 6,600-V sub-station switchgear. (March 12th.)

3-phase, 33,000-V switchgear, 3-phase, 6,600-V switchgear, neutral earthing resistances, and trip circuit batteries. (See this issue.)

Middlesbrough.—April 16th. Electricity Department. Six or 12 months' supply of cables and 12 months' supply of meters. (See this issue.)

Newcastle-on-Tyne.—March 31st. Tyne Improvement Commissioners. One 2-ton overhead electric travelling crane. Mr. A. Blacklock, Commission Offices, Bewick Street, Newcastle-on-Tyne.

New Zealand.—June 21st. Auckland Electric Power Board. L.p. insulators, &c.*

Otley.—March 30th. Wharfedale Isolation Hospital Committee. Electrical installation at the Isolation Hospital, Menston. (March 5th.)

Rosslynlee.—Midlothian and Peebles District Asylum. Stores, including electrical fittings, for six months. Forms from Mr. Chilton L. Addison Smith, clerk and treasurer, 19, Heriot Row, Edinburgh.

Sheffield.—March 31st. Education Committee. Electric wiring and fittings, Firth Park Secondary School. Form of tender, &c., from City Architect, Town Hall.

South Africa.—JOHANNESBURG.—May 6th. S.A. Railways and Harbours. Two electric goods lifts.*

Stoke-on-Trent.—April 13th. Electricity Department. 12 months' supply of mains and cables, a.c. and d.c. meters, sub-station switchgear, and static transformers. (See this issue.)

April 12th. Gas Committee. Electrical and other machinery, gas engine and dynamo. Contract No. 35. Particulars (20s.) from the Chief Gas Engineer, Gas Works, Etruria, Stoke-on-Trent.

Walthamstow.—April 13th. Electricity Department. Steel overhead bunkers and boiler-house buildings; and coal- and ash-conveying plant. (March 12th.)

West Ham.—April 8th. Board of Guardians. Two 100-V d.c. motors, with slide rails, two starting panels, &c. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

22,000 V, 3-core cable (£22,480), British Insulated Cables, Ltd.; do. (£1,008), Siemens Bros. & Co., Ltd.
Bare h.d. copper cable (£5,288).—British Insulated Cables, Ltd.

SYDNEY.—According to the *Daily Telegraph*, the Sydney City Council has accepted the tender of the Commonwealth Shipping Board for the supply of the turbo-alternators at the new power house at Bunnerong, at £660,000. The machines will be built at Cockatoo Island Dockyard in collaboration with the Metropolitan-Vickers Electrical Co., Ltd.

Bedford.—Electricity Committee. Accepted:—

Converting motive power of clinker grab crane from steam to electricity (£324).—Bedford Engineering Co.
H. and l.p. cables for 12 months (schedule prices).—Siemens Bros. & Co., Ltd.
525-h.p. synchronous motor for supply to sewage pumping station (£1,565).—Crompton & Co., Ltd.

Belgium.—Belgian, German and British (Callender's Cable & Construction Co., Ltd.) firms submitted tenders on March 8th to the Royal Belgian Gun Foundry authorities at Liége for the supply of 20 kilometres of single-conductor electric cable. The lowest offer was that of a Belgian company.

Bexhill.—Electricity Committee. Recommended:—

Feeder pillars (£132).—W. Lucy & Co., Ltd.
3,000 yd. distribution cable (£1,156).—Enfield Cable Works, Ltd.
2,587 yd. .5 3-core feeder cable (£3,259); 16 straight-through joint boxes (£44).—British Insulated Cables, Ltd.

Glasgow.—Electricity Committee. Recommended:—

Transformers for various sub-stations :—
Four 100-kVA transformers (£617).—British Electric Transformer Co., Ltd.
Four 200-kVA ditto (£1,268).—Metropolitan-Vickers Electrical Co., Ltd.
Five 400-kVA ditto (£2,553).—Johnson & Phillips, Ltd.
Three 800 kVA ditto (£2,601).—Ferranti, Ltd.
Six step-up transformers for the new refuse disposal works at Govan (£9,090).—Ferranti Ltd.

Switchboard equipment (£8,368).—A. Reyrolle & Co., Ltd.
Extension of switchboard at Virginia Street sub-station (£351).—Bertram Thomas.

Tramway Committee. Accepted :—

Special work.—Hadfields, Ltd.
D.c.c. wire.—London Electric Wire Co. & Smiths, Ltd.

Corporation. Accepted :—

Electric lighting installation in the second section of Stockwell Street improvement scheme (£1,766).—T. B. & J. A. Mathieson, Ltd.

Cleansing Committee. Recommended :—

35 electric vehicles, £1,050 to £1,099 per vehicle, according to battery.—Richard Garrett & Sons, Ltd.

Kirkcaldy.—Accepted:—

Evaporating and de-aerating plant, including heaters and pumps, for Michael Nairn & Co., Ltd.—Mirrlees-Watson Co., Ltd.

Lamp Contracts.—The British Thomson-Houston Co., Ltd., has received a 13 months' contract from the London and North-Eastern Railway (Scottish area) for the supply of "Mazda" electric lamps. The London & North-Eastern Railway Co. has placed contracts for carbon, drawn wire and gasfilled lamps with the Edison Swan Electric Co., Ltd., and the Siemens & English Electric Lamp Co., Ltd.

London. — BATTERSEA. — Electricity Committee. Recommended :—

Supply of cables for one year.—Callender's Cable & Construction Co., Ltd.
Electricity meters for one year.—Chamberlain & Hookham, Ltd., and Ferranti, Ltd.

Manchester.—Tramways Committee. Accepted:—

Siemens "Zed" fuses for 12 months.—Siemens & English Electric Lamp Co., Ltd.

Preston.—Electricity Committee. Accepted:—

Switchgear for Manchester Road sub-station (£1,385).—English Electric Co., Ltd.

South Africa.—CAPE TOWN.—Electricity Committee. Recommended :—

Sixteen 100-kVA single-phase transformers, &c. (£1,555); twelve 50-kVA single-phase ditto, &c. (£865); one 300-kVA 3-phase ditto, &c. (£237); four 50-kVA 3-phase ditto, &c. (£343); 29 externally-operated tapping switches (£302).—English Electric Co., Ltd.
100 unbreakable Whipp & Bourne's fuses (£200).—Sadler & Franks, Ltd.
Alterations and additions to the Reyrolle switchgear at Salt River and Maitland sub-stations, with material required for the Dock Road generating station end of the feeders (£1,888).—A. Reyrolle & Co., Ltd.

Wakefield.—Electricity Committee. Accepted:—

Battery for electric lorry (£138).—Chloride Electrical Storage Co., Ltd.

Watford.—Electricity Committee. Recommended:—

Sundry valves (£800).—Hopkinson & Co, Ltd.

Government Contracts.—The following Government contracts were placed during February, 1926 :—

ADMIRALTY CONTRACT AND PURCHASE DEPARTMENT.

Aluminium ingots.—British Aluminium Co., Ltd.
Cells.—Edison Swan Electric Co., Ltd.
H.p. air compressors.—G. & J. Weir, Ltd.
Electric travelling crane.—T. Smith & Sons (Rodley), Ltd.
Electric heating elements.—Electric Heating Co., Ltd.
Electric lamps.—General Electric Co., Ltd.
Operating panels.—Vickers, Ltd.
Motor-driven pumps.—W. H. Allen, Sons & Co., Ltd.
Electric tractors.—British Electric Vehicles, Ltd.
Tubing, conduits and accessories.—Electrical Conduits, Ltd.; Talbot-Stead Tube Co., Ltd.; General Electric Co., Ltd.; Credenda Conduits Co., Ltd.; Barton & Sons, Ltd.; Eureka Conduits & Fittings Co., Ltd.

WAR OFFICE.

Aluminium ingots.—British Aluminium Co., Ltd.
Petrol-electric vehicle spares.—Rees Roturbo Mfg. Co., Ltd.
Transformers.—Foster Engineering Co., Ltd.
Turbo-alternator and spares.—Brush Electrical Engineering Co., Ltd.

AIR MINISTRY.

Battery (Waddington).—Tudor Accumulator Co., Ltd.
Stand-by plant (Catterick).—Aster Engineering (1913), Ltd.
Internal wiring (North Weald).—S. Dixon & Son, Ltd.
Insulator testers.—Evershed & Vignoles, Ltd.
Magnetos.—North & Sons, Ltd.
Repair of magneto spares.—Delco, Remy & Hyatt, Ltd.

POST OFFICE.

Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; Brit. L. M. Ericsson Mfg. Co., Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.; Sterling Telephone & Electric Co., Ltd.
Testing, protective and miscellaneous apparatus.—General Electric Co., Ltd.; Johnson & Phillips, Ltd.; Power Equipment Co., Ltd.
Battery stores.—Alton Battery Co., Ltd.; F. S. Bayley Clanahan & Co.; General Electric Co., Ltd.; Siemens Bros. & Co., Ltd.
Cable (various).—British Insulated Cables, Ltd.; Enfield Cable Works, Ltd.; Connollys (Blackley), Ltd.; W. T. Glover & Co., Ltd.; Hackbridge Cable Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.; Union Cable Co., Ltd.
Joint box castings.—Bradley & Turton, Ltd.; Britannia Lathe & Oil Engine Co., Ltd.; McDowall, Steven & Co., Ltd.; Planet Foundry Co., Ltd.; Taylor Bros. (Sandiacre), Ltd.; United Steel Companies (T. Butlin & Co.); J. Williamson & Co., Ltd.
Lamps.—H. Miller & Co., Ltd.
Copper wire.—T. Bolton & Sons, Ltd.; E. & E. Kaye, Ltd.; Nevill Druce and Co., Ltd.
V.i.r. core wire.—British Insulated Cables, Ltd.
Manufacture, supply, drawing-in and jointing cable.—Exeter-Torquay: Pirelli-General Cable Works, Ltd. Manchester-Burnley: British Insulated Cables, Ltd. Holborn-Finchley and Holborn-G.P.O. (South) Junction: Standard Telephones & Cables, Ltd.
Cord circuit repeater equipment.—Inverness: General Electric Co., Ltd.
Power plant Devizes (Wilts.) radio station.—J. H. Holmes & Co.
Steel wireless masts. St. Albans wireless receiving station: Armstrong Construction Co., Ltd.
Telephone exchange equipment.—Armley (Leeds), Battersea (New), Sloane (Relief), Poppsgrove (Park).: Automatic Telephone Mfg. Co., Ltd. Mill Hill: Standard Telephones & Cables, Ltd. Ilford: General Electric Co., Ltd.
Private branch exchange equipment.—Failsworth Industrial Society, Ltd., Yardley & Co., Ltd.; Fisher & Ludlow, Ltd. (Birmingham). Harrison (Birmingham), Ltd., Barnsley Co-operative Society: Relay Automatic Telephone Co., Ltd.

H.M. OFFICE OF WORKS.

Cables (Ulster Parliament Buildings).—Hackbridge Cable Co., Ltd.
Wiring western annexe, &c., British Museum.—H. W. Hives.
Cables, wiring &c., Ministry of Pensions Hospital, Orpington.—Bailey and Incledon.

CROWN AGENTS FOR THE COLONIES.

Adapters, &c.—General Electric Co., Ltd.
Cable.—St. Helens Cable & Rubber Co., Ltd; F. Smith & Co.
Coal-conveyor plant.—Fraser & Chalmers, Ltd.
Electrical materials.—W. T. Henley's Telegraph Works Co., Ltd.
Generating plant.—Campbell Gas Engine Co., Ltd.
Lux cells spares.—Chloride Electrical Storage Co., Ltd.
Telephones.—British L. M. Ericsson Mfg. Co., Ltd.
Train-lighting equipment.—J. Stone & Co., Ltd.
X-ray apparatus.—Watson & Sons, Ltd.

Forthcoming Events.

British Electrical Development Association Conference.—Friday, March 26th. At Caxton Hall, Westminster, S.W. At 9.30 p.m. Paper on "Progress and Prospects of Commercial Electric Cookery," by Mr. J. J. McKenna.

Birmingham Electric Club.—Friday, March 26th. At the Grand Hotel, Birmingham. At 7 p.m. Lecture on "Telephone Repeaters," by Mr. A. B. Hart.

Physical Society of London.—Friday, March 26th. At the Imperial College of Science, South Kensington. At 5 p.m. Ordinary meeting.

Royal Institution.—Friday, March 26th. At 21, Albemarle Street, W. At 9 p.m. Lecture on "The Radiation from Atomic Nuclei," by Sir Ernest Rutherford.

Saturday, March 27th. At 3 p.m. Lecture on "The Rare Gases of the Atmosphere," by Sir Ernest Rutherford.

National Association of Supervising Electricians.—Saturday, March 27th. At the Holborn Restaurant. Annual dinner.

Nottingham Society of Engineers.—Monday, March 29th. At the Victoria Station Hotel. At 7.30 p.m. Lecture on "Emergency Lifting Jobs," by Mr. H. E. Warsop.

Royal Society of Arts.—Monday, March 29th. At John Street, Adelphi, W.C. At 8 p.m. Cantor Lecture on "Thermometry," by Mr. W. F. Higgins. **(Lecture III.)**

Institution of Electrical Engineers (North-Western Centre).—Tuesday, March 30th. At the Engineers' Club, Manchester. At 7 p.m. Lecture on "Electro-Farming; or the Application of Electricity to Agriculture," by Mr. R. B. Matthews.

(South-Midland Centre).—Wednesday, March 31st. At the University, Birmingham. At 7 p.m. Papers on "Power Factor and Tariff," by Mr. E. V. Clark; and on "Power Factor Improvement," by Mr. E. W. Dorey.

Illuminating Engineering Society.—Tuesday, March 30th. At E.L.M.A. Lighting Service Bureau, 15, Savoy Street, W.C. Discussion on "Stage Lighting," to be opened by Mr. H. L. Groom.

Roentgen Society.—Tuesday, March 30th. At 1, Wimpole Street, W.1. At 8.15 p.m. Ninth Silvanus Thompson Memorial Lecture by Sir John Thomson-Walker.

The "Electrical Review" Service Department.

Inquiries must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

Hedge-clipping machines (electrically operated).

Red Cross commutator lubricant.

Notes.

National Association of Supervising Electricians.—On March 12th Mr. E. Preece lectured, at the Y.M.C.A. Buildings, Manchester, on "Electric Driving of Textile Factories," illustrating his remarks by lantern slides. Mr. Preece outlined the early history of the textile industry, depicting some of the methods adopted for driving when the steam engine was introduced, and led up to modern mechanical and electrical methods. The chair was occupied by Mr. E. North, M.J.Inst.E., chairman of the Association, supported by Mr. A. Brammer, the general secretary.

The Lowest Domestic Tariff.—Whilst going to press we have received the following letter:—In your issue of the 19th inst. you refer in a leading article to the system of charging for an "overall" domestic supply introduced at Gravesend, and remark that "so far, we have come across only one undertaking with a similar system—Watford."

In Sheffield such a system has been in operation for many years (since 1913) the quarterly charge being 2½ per cent. on the pre-war rateable value, plus one halfpenny per unit. This basis price has been maintained since its inception, and at the present time is subject to 5 or 10 per cent. increase only, according to whether the ultimate price works out at over 2d. per unit or at 2d. or under per unit respectively. The increase will be abolished at no distant date, when Sheffield prices will be at pre-war rates. I have no doubt that there are also other one-time members of the now defunct "Point-five Association" who are continuing with similar schemes, although possibly you are correct if your reference is only to the Greater London area.—S. E. Fedden, *General Manager*, Electric Supply Department, Sheffield, *March 22nd*, 1926.

Appointments Vacant.—Draughtsman assistant (£130) for the Cheadle and Gatley U.D.C. Electricity Department. Plumber-jointer for the Brighton Corporation Electricity Department. Assistant for research work on miners' electric lamps (£377) for the Safety in Mines Research Board. Assistant engineer (£345) for the Wimbledon Corporation Electricity Department. Junior shift engineer for the Reigate Corporation Electricity Department. (See our advertisement pages to-day.)

All-Electric Houses at Salford.—The Salford Corporation Housing Committee has decided to equip the 126 working-class houses which are being erected on the Littleton Road Housing Estate at Lower Kersal so that they will be all-electric. The decision was arrived at after a visit to the estate in company with the Committee's architect, Mr. Charles Swain. An all-electric house had been fitted up by the Electricity Committee for the purposes of the visit, and it was the effective manner in which it was equipped that led the Housing Committee to decide in favour of the principle.

Public Address Equipment in Italy.—The Marconi equipment which has become familiar through its reproduction of speech and music on such occasions as the opening and closing of the Wembley Exhibition, and other public functions, achieved success in Italy last year, and the Italian Marconi Co. has received requests for it to be used at many important sports gatherings in Italy.

Heavy-Load Fuse Tests.—A large gathering of electrical engineers of the Manchester district attended a series of fuse tests conducted recently by Messrs Parmiter, Hope and Sugden, Ltd., at the Polygon sub-station of the Manchester electricity undertaking and subsequently at the Fluvent Electrical Works, Longsight. The demonstrations showed very effectively the superiority of the enclosed and protected fuses over those of the open types. No fewer than 15 "short" tests were carried out on a short-circuit current of 3,540 A at 450 V. All the fuses were of the low-pressure re-wirable type, and were designed for a continuous carrying capacity of 60 A. The machine used in connection with the tests was rated at 125 kW. The fuses tested were of the following types:—Copper, tin, aluminium, and zinc wire in air; copper and tin wires in ordinary types of fuse holders; ordinary cartridge fuses; Aeroflex traction and light-duty fuses, open, in iron case, and in iron case with one pole connected to the case; and the Aeroflex light-duty indicating fuse. After the startling reports and the display of pyrotechnics from some of the earlier experiments, the Aeroflex fuses revealed unquestionable advantages, including their ability to stand up to heavy-duty conditions where the power behind the short-circuit is considerable. At the Fluvent works it was shown by simple experiment how an Aeroflex fuse element would behave when blowing in air. The liquefaction of the low-melting fuse metal was demonstrated with the fuse on a 6-V circuit. After a four-hours' run on full load the temperature of a 1,500-A Aeroflex fuse was 29.3 deg. C. The same fuse was blown on a slight overload in 3 min. 55 sec. Three tests were then carried out on a 60-A Aeroflex fuse blowing at loads of 120, 150, and 200 A, and the respective times taken were 1 min. 46 sec.; 34 sec.; and 12½ sec. After the tests the party had the opportunity of examining some h.p. fuses blown at various generating stations. Aeroflex fuses rated at from 2,000 to 11,000 V, and some three-phase distribution boxes and boards were also seen. The most interesting exhibit of blown fuses was two from Birmingham. These were blown across a 460-V, 6,000-Ah battery, the total resistance in circuit being .006 ohm. These blown fuses revealed the uniformity of the fusible element, the actual rupture taking place on the copper strip at the extreme ends.

After the demonstrations, Messrs. Parmiter, Hope & Sugden, Ltd., entertained the company to lunch at the Midland Hotel, when some complimentary speeches were made. Mr. Vernon Hope spoke of the difficulties that had been experienced in the designing of fuses, perhaps "the most ill-used members of the electrical family."

The "Aeroflex" fuse was described in detail in the Electrical Review, April 10th, 1925, and it will be recalled that the fusible element consists of a patented bi-metal fuse strip in the centre of which is a hollow pocket of pure tin filled with an inert gas.

Progress of the Hiring System at Ilford.—We have received from Mr. A. H. Shaw, M.I.E.E., engineer and manager of the Ilford U.D.C.'s electricity supply undertaking, the following particulars regarding the progress made in the hiring of installations, apparatus, &c., in his area to December 31st, 1925:—

Installations or apparatus.	Number out on hire.
Wiring installations	500
Cookers	350
Kettles	380
Radiators	933
Irons	347
Immersion heaters	35
Toasters	16
Vacuum cleaners	54
Washers	13
Motors	21
Total	2,649

We also learn from Mr. Shaw that his undertaking has been hiring out apparatus for some three years; a separate charge is made for each appliance, energy being charged for at one of the ordinary tariffs, which are as follows:—

Residential: 12½ per cent. p.a. on rateable value, plus ¾d. per kWh.

Lighting, flat rate, 4½d. Lighting, m.d. rate, 7d. and 1½d.

Heating and cooking, flat rate, 1d. (summer), 1½d. (winter quarters.).

The undertaking possesses hiring powers only, under the Act of 1919; people who wish to purchase outright are referred to the local contractors, and it is estimated that an equal number of appliances has been sold by the latter in this way since the scheme was introduced.

French Trials of Accumulator Vehicles.—The Union des Syndicats de l'Electricité, of Paris, is organising a third series of trials of accumulator vehicles, following those which were carried out in 1923 and 1924. Entries for the trials, which have been arranged with the co-operation of the Ministry for War, the Automobile Club of France, &c., will be received up to April 15th at the offices of the Union, and the trials are to take place in Paris between June 5th and 20th.

London Traffic Inquiry.—An inquiry was opened on March 16th at the Middlesex Guildhall by a sub-committee of the London and Home Counties Traffic Advisory Committee into the travelling facilities of East London. Suggestions were made for the electrification of the L.N.E. Railway from Chingford, the electrification of the North London section of the L.M. and S. Railway, and the construction of a new electric railway from the City to Waltham Cross, as means for relieving the traffic congestion.

The Batti-Wallahs' Society.—On March 17th, the Batti-Wallahs held their annual dinner at the Hotel Victoria, London, the President, Mr. A. W. Blake, M.I.E.E., occupying the chair; there was a large attendance of members and guests, many ladies being present.

After the president had proposed the toast of "The King," who, he pointed out, was a sailor, Vice-Admiral Sir R. B. Dixon, K.C.B., proposed "The Batti-Wallahs' Society," referring to the good comradeship which was one of its most notable features. The president, in his reply, said they were all interested in electricity and proud of its progress; it had been hindered by legislation, and he looked with doubt upon the formation of too many organisations to control the industry, which had to bear all the expenses. It was only the applications of electricity that would enable them to enjoy the comforts and benefits that it made available.

Mr. G. W. Partridge, M.I.E.E., vice-president, proposed "The Visitors," praising the work of the Electrical Association for Women, which in one year had enrolled 500 members and was educating women in the domestic uses of electricity. Col. Crompton was the "Grand Old Man" of the industry; in the early pioneering days they knew where they were; now, thanks to Parliamentary interference, they did not know where they were. Miss C. Haslett responded, referring to the electricity supply scheme recently carried out by Miss M. Partridge in a Devonshire town, and urging that they should not talk too much about "cheap electricity," as people were given the impression that the Bill would bring a cheap and abundant supply. Electricity gave women the prospect of relief from drudgery and of opportunities for creative work. Col. Crompton also responded, declaring that he saw sure signs of renewed prosperity in trade, in spite of the Bill, and giving many interesting reminiscences.

Mr. F. Pooley, past president, proposed the health of the president, who, he said, was determined to develop the uses of electricity and imposed no restrictions in his area. Mr. Blake in his reply paid a tribute to the work of the hon. secretary, and proposed the toast of his health, which was heartily honoured; Mr. M. Whitgift briefly acknowledged the compliment.

An excellent musical entertainment was provided, and the function was very much enjoyed

The Manchester Steam Users' Association.—The annual general meeting of the above Assocociation was to be held on March 23rd and the annual report (1925) presented for adoption. At the end of the year in question 1,763 members were on the Association's books and the numbers of works and boilers inspected during the year were 5,047 and 11,662 respectively. The revenue for the year amounted to £43,111, and the working expenses £38,291, leaving a gross surplus to be carried down of £4,820. The Association has completed its seventy-first year of activity.

Fatality.—The death of Richard Henry Goffe (21), an electric meter repairer employed by the Birmingham Corporation Electric Supply Department, at Dale End, was investigated by the Birmingham City Coroner (Mr. Isaac Bradley), last week. The deceased had been employed on mercury meters, but it was not clear as to how he had actually come in contact with the mercury. Dr. Cooper said that he came to the conclusion that Goffe was suffering from mercurial poisoning, and saw that the case was quite hopeless from the point of view of treatment. Professor G. Haswell Wilson (Professor of Pathology at the University) who made a post-mortem examination in conjunction with Dr. Cooper, said that he came to the conclusion that death was due to myelitis, a disease that arose without any obvious cause. Witness added that there was no evidence of chronic mercurial poisoning in the system. Mr. Rigby, a public analyst, who had examined the liver, kidneys and spleen, said he found that the weight of mercury therein was 1.38 grains per lb. of material. The coroner found that the man died from the myelitis condition occurring in a patient who was already suffering from chronic mercurial poisoning.

German Telephones for Japan.—It is reported from Berlin that the Siemens and Halske Company has received orders from the authorities at Kobe and Osaka for the establishment of automatic telephone exchanges. The value of the orders is put at about £200,000.

The London Electrical Engineers.—27TH (LONDON) ANTI-AIRCRAFT BATTALION R.E. (T.A.).—Officer Commanding: Lt.-Colonel C. H. S. Evans, O.B.E. The following orders have been issued for April, 1926:—304th Company (Major P. F. Foulger). 305th Company (Major A. W. M. Mawby, O.B.E., A.M.I.E.E.).—Tuesdays, 7 p.m. to 9.30 p.m. 306th Company (Major F. C. Clarke, A.M.I.E.E.).—Mondays, 7 p.m. to 9.30 p.m. A voluntary camp will be held at Biggin Hill from Good Friday to Easter Monday. It is hoped that at least eight officers and 80 other ranks will attend. Following this camp four officers will be sent on a course to Gosport. General training will be carried out with special regard to musketry and preparation for a recruiting campaign.

Educational.—NORTHAMPTON POLYTECHNIC INSTITUTE.—An entrance examination in connection with the Engineering Day College of the above will be held on Tuesday, April 13th. Further information may be had on application to the Principal. (See our advertisement pages to-day.)

The Electrical Power Engineers' Association.—The annual dinner of the London Western Section of this Association was held on Saturday last, at Stewart's Restaurant, London. The chairman, Mr. T. Welch, presided over a large gathering of members and guests, including many ladies. After the loyal toast, Mr. J. N. Waite, M.I.E.E., proposed "The Association." Referring to the Electricity Supply Bill, he questioned where it could cheapen the supply of electricity, and said that there were already too many authorities—now another was to be added. He regretted the omission of compulsory wayleaves, and considered the compensation clause unsatisfactory. In seven years the Association had made remarkable progress, and having consolidated its position it could now devote attention to questions other than protection; the scheme of training had already been adopted by the No. 5 Joint Board. The members had gained a reasonable remuneration, and should give professional service in return for a professional salary. Mr. A. J. Ostler, president, responded, referring to the excellent educational work done by Mr. Waite's lectures, and remarking that hundreds of power stations were to be shut down, said the members were fortunate in having an Association that would look after their interests.

Mr. W. J. Oswald proposed "The Ladies," to whom, he said, the development of electricity in the home was especially important, and Mr. A. W. Compton responded on their behalf.

The toast of "Our Section and Our Chairman" was proposed by Mr. W. E. Rogers, who remarked that the famous grid and the standardisation of frequency had been washed out for a long time; Mr. Welch, in responding, regretted the loss of the hon. secretary, Mr. T. S. Wallis, who was taking up the post of station superintendent at Bristol.

Music and dancing enlivened the proceedings, which were very successful.

Chief Technical Assistants' Association.—The twelfth annual dinner of this Association will be held at the Holborn Restaurant on Saturday, April 10th, at 6.45 p.m.

The Annual Motor Parade.—The 20th Annual Parade of Commercial Motor Vehicles, organised by the Commercial Motor Users' Association (Inc.), to encourage drivers to take a personal interest in the driving and condition of their vehicles, will be held in London to-morrow, March 27th. The parade is limited to teams of three vehicles in the ordinary classes, but single vehicles may be entered for the electrical class which is open to both members and non-members. The British Electrical Development Association (Inc.) is co-operating with the C.M.U.A. and money prizes ranging from £1 10s. 0d. to 10s. will be awarded to the drivers of the winning vehicles in the electrical class.

Hackney Electricity Undertaking.—The progressive electricity supply policy adopted at Hackney, is, as our readers are aware, exciting increasing interest. The big showroom and service policy has its critics and some of their statements are considered to call for investigation. For instance, Councillor W. Hammer has given notice of the following motion at the Council meeting:—

"That this Council respectfully requests the Electricity Commissioners to appoint experts, both engineering and financial, for the purpose of enquiring into allegations publicly made by Alderman Genese on the 10th February, 1926, to the following effect:—

"(1) 'That the Electricity Show Rooms have cost the ratepayers £43,000.'

"(2) 'That if anything should happen to the Electricity Undertaking, the ratepayers would be faced with a liability of over one million pounds.'

"(3) 'That the Commissioners should be requested to inform the Council as to the result of such inquiry at the earliest possible moment.'"

Institution Notes.

Institution of Electrical Engineers.—NORTH-WESTERN CENTRE.—The annual general meeting was held on Tuesday, March 16th, having been brought forward from the date originally fixed, March 30th, on which a paper is to be read by Mr. R. B. Matthews upon "Electricity in Agriculture." Mr. A. G. Ellis (chairman of the Centre), who presided, stated that members of the Farmers' Union had been invited to attend on that occasion. The membership of the Centre at March last was 1,092, as compared with 1,069 for the previous year. Votes of thanks were passed to the Engineers' Club for the facilities afforded for meetings of the Centre, and to the authorities of the Municipal College of Technology for allowing the lecture by Mr. A. P. Trotter on "Illumination and Light" to be given in the large hall of that building. The officers for the year were elected, including the chairman, Mr. W. J. Medlyn; vice-chairmen, Messrs. H. A. Ratcliffe and A. B. Mallinson; and secretary, Mr. A. L. Lunn.

Institution of Chemical Engineers.—The examinations for the Associate Membership of the Institution will be held in June and July next. Full particulars can be obtained from Mr. C. S. Garland, hon. registrar, The Institution, Abbey House, Westminster, S.W. (See our advert. pages to-day.)

Institution of Mechanical Engineers.—In a paper, "The High-Efficiency Oil Engine," read before the above Institution, Mr. Alan E. L. Chorlton dealt fully with the results of recent investigations on internal combustion. The possibilities of increasing the efficiency of the Diesel engine were considered, and the author said that to do that the design must follow motor-car and aero practice in employing higher speeds, smaller pistons, and fewer rings. Commenting on the mechanical system of fuel injection, Mr. Chorlton said that before good combustion could be possible the feed pump would have to measure out, accurately and consistently, the requisite amount of fuel and inject it into the cylinder under a high pressure with a rapid start and finish to its flow.

Junior Institution of Engineers.—In a lecture, "Paint Spraying," before the above Institution on March 12th, Mr. F. E. Webb said that from the preservation point of view the application of paint by means of a brush did not attain its object nearly so well as paint sprayed on under pressure—the former merely gave a surface coating while the latter method caused the paint to penetrate the pores of both wood and mild steel, as could be ascertained by microscopical examination, besides penetrating crevices and difficult corners not easily reached by a brush. The other advantages claimed were ease and rapidity of execution and a far more perfect surface than that attained by the brush method.

On March 19th, a paper on "Pipework—its Manufacture and Layout," was read by Mr. G. H. Willett, who described the different methods of welding pipes and making weldless tubes, lantern slides being shown of the various processes. The four main types of joints, spigot and socket, screwed and socket, flanged, and welded, were described, and particulars given of the variation necessary for pipes of different materials and for the conveyance of different fluids. The design of pipe layouts was also dealt with. The author said the chief source of danger in a steam main was the problem of drainage, and the design should be such that any condensed steam which might collect, whether in commission or when the steam was shut off and the main had cooled down, could be drawn off automatically by steam traps at as few points as possible.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Mr. Robert Bain has been appointed general superintendent of the Pacific Cable Board's system, to take charge of all staff and technical matters, and assist Mr. Hunter, the general manager.

Mr. R. W. Weekes, consulting engineer, has removed his offices to Clutha House, 10, Princes Street, Westminster, S.W.1, where his telephone number will be "Victoria 4007."

The Islington Borough Council Electricity Committee recommends that the salary of Mr. Albert Gay, chief electrical engineer, be advanced from £900 to £1,150 per annum.

Mr. F. R. Turner, senior charge engineer in the power station of the Stalybridge, Hyde, Mossley and Dukinfield Tramways and Electricity Board (previously reported here as having been appointed charge engineer with the United Alkali Co.) was, on the occasion of his leaving Stalybridge, presented with a set of three antique Korean bronze vases. Mr. R. Blackmore, engineer-in-chief, made the presentation on behalf of the whole of the staff and employés.

Douglas (Isle of Man) Town Council has increased the salary of Mr. P. Bregazzi, mains superintendent, from £273 to £299 per annum, and that of Mr. R. M. Clague, station superintendent, from £305 to £331 per annum.

Mr. Leslie G. Toplis, who has for some time past been associated with the Enfield Cable Works, Ltd., is severing his connection with that company at the end of March, and is taking over the East of Scotland interests on behalf of Messrs. Morris Warden & Co., Ltd., of Glasgow.

Mr. J. S. Tebbitts, assistant engineer of the Post Office Engineering Department of the Hanley Section, has been appointed sectional engineer in succession to the late Mr. A. E. Giffin.

Eighty four applications were received for the position of carshed superintendent at Rawtenstall, which is becoming vacant by the appointment of Mr. A. Baxendale as rolling stock superintendent at Wallasey. Three gentlemen appeared before the Committee on March 18th, and Mr. A. Cooper, of Barrow-in-Furness, was selected for the position.

Mr. H. J. Smith, who recently relinquished the position of resident engineer of the Hertford, Ware and Hoddesdon area of the North Metropolitan Electric Power Supply Co. to take up an appointment as district engineer to the Bedfordshire, Cambridgeshire and Huntingdonshire Electricity Co., was presented with a silver-mounted engraved testimonial by the local staff on leaving.

Portsmouth Corporation Tramways Committee recommends the appointment of Mr. Ben Hall (Halifax) as engineer and general manager at a salary of £1,000 a year.

Mr. E. W. Dickinson, M.I.E.E., has joined the technical staff of the Electricity Commission.

Mr. James Nelson, M.I.E.E., M.I.R.E., is terminating his engagement with the British Insulated & Helsby Cables, Ltd., at the end of March, after 22½ years' service. He is taking over the Western area and several other districts on behalf of the British Resistor Co., and is devoting special attention to the wireless side of its products generally in the British Isles. The main line of the company is "Globar," which is specially suitable for electric cooking and heating apparatus. During his time with the British Insulated & Helsby Cables, Ltd., Mr. Nelson has carried out some large contracts; he superintended the laying and testing of the first 100,000-volt cable laid in this country, for Mr. J. S. Highfield, who was then with the Metropolitan Electric Supply Co., and he has had exceptional experience in connection with electrolytic trouble on mains, which he places at the disposal of other engineers.

Obituary.—Mr. Donald McColl.—In our issue of February 5th, 1926, p. 228, we announced the death, at Seaford, Sussex, of Mr. Donald McColl, formerly general manager of the Shanghai Electric Construction Co., Ltd. According to news just to hand, the *North China Herald* of January 30th contained an account of Mr. McColl's work and career. He was born in Glasgow and joined the Corporation tramways there when the cars were horse-drawn, remaining there until the system was electrified. In 1902 he went to the Lisbon tramways for three years, and in 1905 he received an appointment with the London Underground group. Here he was closely associated with the Bakerloo Tube. He went to Shanghai in 1908. There, following the opening of the tramways, he had many difficult problems to face. He envisaged a scheme for tramways in Shanghai as great as that of Glasgow, and in all his correspondence and negotiations with the Shanghai Municipal Council showed his determination, if possible, to secure this. He was an expert in tramway organisation, and foresaw great possibilities for railless trams. As an economist, Mr. McColl also took a very high rank. He was faced, as general manager of the tramways, not only by the differences in the various Chinese currencies, but also by the constant depreciation in copper coinage—the medium in which the greater part of tramway fares is paid. His contributions to the literature of tramway accountancy were very considerable. He published a book on tramway accounting which has been adopted by numerous tramway organisations at home as a standard work. It was not in Shanghai alone that his influence was felt, for subsequent to the war it extended to Singapore, where the Shanghai Electric Construction Co. undertook the reorganisation of the Singapore tramways. This system had not been successful as a commercial venture, but Mr. McColl saw that it could be made so, and under his direction a reorganisation has been proceeding during the past few years.

New Companies Registered.

Lewis Thomas & Sons, Ltd. (212,362).—Private company. Registered March 12th. Capital, £2,000 in £1 shares. Objects:—To acquire the business of electrical and mechanical engineers carried on by L. Thomas, J. L. Thomas, and R. M. Thomas at 54, North Parade, Aberystwyth, as "Lewis, Thomas & Sons." The directors are:—L. Thomas, Boulevard, North Parade, Aberystwyth, electrical and mechanical engineer; J. L. Thomas, 54, North Parade, Aberystwyth, electrical engineer. L. Thomas is to be appointed managing director for life with a commencing salary of £260 per annum. Secretary: W. L. Edwards. Registered office: 54, North Parade, Aberystwyth.

Radiodyne, Ltd. (212,364).—Private company. Registered March 12th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of electricians, wireless and mechanical engineers and manufacturers, &c. The first directors are:—G. K. Field, 19, Edith Villas, W. Kensington, W.14; E. L. Rawlins, 143, Graham Road, Wimbledon, S.W.19 (both permanent, subject to each holding 500 shares). Remuneration, £50 each per annum. Solicitors: Richard Brooks & Son, 24, Lawrence Lane, Cheapside, E.C.2. Registered office: 110, Greyhound Road, Hammersmith, W.6.

Roddis Heaters, Ltd. (212,419).—Private company. Registered March 15th. Capital, £1,500 in 950 10 per cent. cumulative preference shares of £1 each and 11,000 ordinary shares of 1s. each. Objects:—To carry on the business of radio, electrical, automobile, hydraulic, mechanical, and mining engineers, manufacturers and workers of, and dealers in electricity or any like power, or any power that can be used as a substitute therefor, for purposes of sound, light, heat, motive power or otherwise; manufacturers and constructors of, and dealers in wireless instruments and parts, &c. The subscribers (each with one preference share) are:—H. Newington, 14, Queen Victoria Street, E.C.4, secretary; G. E. N. Taylor, 54, Goldhurst Terrace, N.W., solicitor's managing clerk. The first directors are to be appointed by the subscribers. Qualification, £50 shares or stock. Remuneration as fixed by the company. Solicitors: Warwick & Gilbert, 14, Queen Victoria Street, E.C.4. Registered office: 14, Queen Victoria Street, E.C.

Yesly Electrical Supplies, Ltd. (212,548).—Private company. Registered March 19th. Capital, £1,000 in £1 shares (500 "A" ordinary and 500 "B" ordinary). Objects:—To acquire from the proprietors, Engineering Supplies, Ltd., all their right, title, and interest in the trade mark "Yesly," and to carry on the business of electrical and motor engineers and contractors, suppliers of electricity, carriers of passengers, manufacturers of, and dealers in railway and tramway appliances and requirements, telegraphic, telephonic, and wireless apparatus, traction engines, road and other rollers, motor wagons, lorries, carriers, cars, cycles, &c. The first directors are:—W. R. T. Willis, 3, Broxholm Road, West Norwood, S.E., electrical engineer (permanent chairman and managing director); W. H. Faber, 115, Kilmartin Avenue, Norbury, printers' works manager. Qualification, 1 share. Solicitors: White, Davison & Co., 61 and 62, Chancery Lane, W.C.2. Registered office: 5a, Iliffe Yard, Crampton Street, Walworth, S.E.

Gamble & Sons, Ltd. (212,322).—Private company. Registered March 11th. Capital, £4,000 in £1 shares. Objects:—To carry on the business of an electric light company and that of electricians, mechanical engineers, suppliers of electricity, &c. The directors are:—A. R. Gamble (permanent managing director), 283, Belgrave Gate, Leicester; T. H. Gamble, 283, Belgrave Gate, Leicester; Minna A. Gamble, 283, Belgrave Gate, Leicester. Qualification, 50 shares. Remuneration as fixed by the company. Solicitor: A. H. Headley, Queen's Chambers, Horsefair Street, Leicester. Registered office: 283, Belgrave Gate, Leicester.

Looe Electricity Co., Ltd. (212,534).—Public company. Registered March 19th. Capital, £6,000 in £1 shares. Objects:—To acquire the business of electrical engineers recently carried on by T. Roberts and J. Taylor, at Looe, Cornwall, as "Roberts & Co.," to adopt an agreement between F. West, of 2, Courtenay Street, Plymouth, as trustee in bankruptcy of the above company of one part, and A. J. Brain, C. W. Cook, E. Middleton, H. Shapcott, B. D. Webster, and A. West, all of Looe, as trustees for this company of the other, and to carry on the said business and that of an electric light company, &c. Minimum cash subscription, £3,000. The directors (to number not less than 5, nor more than 11) are:—J. C. Bray, Wesley Terrace, East Looe, retired butcher; A. H. Brian, Fore Street, East Looe, confectioner; C. W. Cook, Ship Hotel, East Looe, hotel proprietor; A. E. Hurford, Sandplace Road, East Looe, solicitor; R. Marshall, Higher Market Street, East Looe, greengrocer; E. Middleton, Higher Market Street, East Looe, fish merchant; T. H. Northam, North Road, West Looe, granite works manager; R. L. Prynn, "Rockville," East Looe, fish merchant; H. Shapcott, "Cross Sands," Hannafore, West Looe, accountant; B. D. Webster, Port-by-Han Hotel, West Looe, solicitor; A. West, Fore Street, East Looe, motor engineer. Qualification, £10. Remuneration as fixed by the company. Solicitor: R. A. Peter, Looe, Cornwall.

Official Returns of Electrical Companies.

Oco Electrical Apparatus, Ltd.—C. D. Britten, of Princes Chambers, 16, John Dalton Street, Manchester, was appointed receiver on March 6th, 1926, under powers contained in debentures dated November 18th, 1925, and January 6th, 1926.

Elpar, Ltd.—Particulars filed of £300 debentures authorised February 23rd, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Davenport Accessories, Ltd.—Two second mortgage debentures, dated March 1st, 1926, to secure any sums which the person entitled to the charge may be called upon to pay under lease dated December 31st, 1924, respectively, charged on 12 and 14, Pembroke Street, Islington, and the company's undertaking and property, present and future, including uncalled capital. Holders: F. J. W. Palmer, 2, Elderton Road, and N. Rose, 22, Chadwick Road, Westcliff, Southend-on-Sea.

Rapinet, Ltd.—Particulars filed on February 24th, 1926, of £1,000 debentures authorised September 7th, 1925, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Advance Engineering Co., Ltd.—W. G. Hall, of National Provincial Bank Chambers, Silver Street, Hull, incorporated accountant, was appointed receiver on February 22nd, 1926, under powers contained in debenture dated August 19th, 1921.

Peerless Productions, Ltd.—Particulars filed on February 24th, 1926, of £2,000 debentures authorised August 20th, 1925, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Fraser Mares, Ltd.—Debenture dated February 23rd, 1926, to secure £500, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: H. Holmes, 98, Frederick Street, Cardiff.

Cooke and Whitfield Wireless, Ltd.—E. P. Q. Carter, C.A., of 33, Waterloo Street, Birmingham, was appointed receiver on March 4th, 1926, under powers contained in debenture dated May 9th, 1924.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Kensington and Knightsbridge Electric Lighting Co., Ltd.

Col. R. E. B. Crompton, C.B., presided at the annual meeting of the company on March 18th. In the course of his speech he pointed out that the company could claim to be the oldest supply company in London, and for 40 years had given a continuous supply at gradually reduced prices and had maintained steady dividends. Their generating stations were now to be handed over to the London Power Co. and they would become distributors only. Referring to the electricity scheme, Col. Crompton said that the promised reductions from the concentration of generating plant and by the adoption of up-to-date machinery, would not by themselves reduce the price to the public. Even if they obtained all that they were promised, the company's present average rate of 3d. would only be reduced to a little over 2½d. per kWh. In all public services distribution and corresponding capital costs more than doubled the generating costs, and any future considerable reductions could only come about by greatly increased use. An increase of 3,000,000 kWh per annum would enable them to reduce their average price by a further ½d. per kWh. Reverting to the report, the chairman said that during the year the modernisation of the Cheval Place and Kensington Court converting stations had been completed and the work on the Albert Vaults and Pelham Street stations was well advanced. He quoted figures showing how the company had reduced its average price per kWh from 4.9d. in 1921 to 3.21d in 1925. The question of further reductions was deferred by the delay in the settlement of an agreed figure for standard prices to be charged under the new Act. In the meantime, however, they had made certain reductions in charges. Col. Crompton also referred to the formation of a superannuation fund for the staff, stating that an initial appropriation of £10,000 would be made for the purpose. Later the shareholders would be asked to agree to devote a certain proportion of the free reserves to this fund. The report and accounts were adopted.

Brompton and Kensington Electricity Supply Co., Ltd.

The annual meeting was held on March 18th. Mr. H. R. Beeton (chairman) presided, and in presenting the report and accounts, said that although the rate of growth of the company's business had not been so great as in some previous years, the year was a satisfactory one. The value of their assets had not yet been determined, but when that was done the capital of the company would be reconstituted on a new basis, and they would be able to see with unwonted precision the future which awaited them. Referring to the Government's Electricity Bill, the chairman said that if the consumers' hopes of economies from concentration in production and interconnection in transmission should not be entirely fulfilled, it would not be the first time in the history of the electricity supply industry that a too-jealous denial of private enterprise had defeated the public good. They could claim to be among the pioneers in the supply of domestic electricity, but they could not afford to risk experimental expenditure until they knew the incidence of profit or loss resulting from it, and they were therefore restricting the operations of the accessories company for the time being.

The report and accounts were adopted.

Marconi International Marine Communication Co., Ltd.

The directors' report shows that the gross revenue for 1925 increased from £976,359 to £995,522, and the net profit from £83,576 to £118,979. This result was obtained in the face of continued depression in the shipping industry. The year was an onerous one for shipowners and rebates to them in respect of ships laid up had to be continued; otherwise the company's revenue would have been greater. The revenue includes the sum of £9,077 in settlement of a claim against the Italian Government. The improvement in the company's position is attributed to a substantial reduction in administration expenses. Discussions are still proceeding in connection with the claim for excess profits duty. The report makes reference to the strike of wireless operators, and states that the whole of the company's debentures have been redeemed, with the exception of £1,680, for which provision is made. To meet expenditure that is anticipated the directors propose to allocate £15,000 to the creation of a reserve for obsolescence of plant. It is also proposed to pay a dividend of 7½ per cent. for the year and to carry forward £16,269. The report records the death of Capt. H. Riall Sankey and the appointment of Major H. Lefroy to the board. Meeting: March 31st.

South London Electric Supply Corporation, Ltd.

The report for the past year shows that the balance on working was £128,900, and the addition of £13,094, brought forward makes available £141,994. After paying debenture interest, &c., and transferring £5,000 to taxation reserve, £25.000 to depreciation, renewals, &c., reserve, and £60,000 to general reserve, there remains £45,485, which it is proposed to distribute as follows:—Dividend of 6 per cent. on the preference shares (3 per cent. already paid); dividend of 15 per cent. on the ordinary shares (5 per cent. already paid); carried forward £4,685. The applications received during the year were equivalent to 1,633 kW, making the total 25,658 kW, and the amount of energy sold rose from 13,670,496 kWh to 14,515,019 kWh. Reference is made to the London Electricity (No. 1) Act, and it is stated that the company's generating station has for some time past been connected with the system of the County of London Co., and inter-connecting mains are now being laid to the Barking station of that company. The appointment of Mr. A. Page to the board is also mentioned. Meeting: March 30th.

Metropolitan Electric Supply Co., Ltd.

Mr. A. W. Tait, C.B.E., presided at the annual meeting last week, and in presenting the report and accounts, he said that the revenue from the sale of energy had increased by 6¼ per cent., and energy sold by 23.76 per cent. There had been a satisfactory increase in the demand for electricity for lighting, heating and cooking, but the substantial increase was principally due to the bulk supplies which were being given to various authorised distributors in the western area. The company's mains were now linked up with the stations of the Central Company and the Charing Cross Company. The business of their allied undertakings also continued to expand. With regard to the Chesham Electric Light & Power Co. which they had taken over recently, the mains had been taken into that company's area and the station at Chesham was closed down last autumn. The generating costs showed a satisfactory decrease, as did the price of coal. The distribution costs had risen owing to increased repairs and mains in connection with the change-over which was being effected in Acton, Paddington and mid-London. When that change-over was completed, there should be a substantial reduction in the charge. Referring to the heavy assessment for rates, the chairman said that appeals had been lodged in a number of instances. Under the terms of their agreement with the London Power Co., that company had an option to purchase the Willesden and Amberley Road stations. With regard to the former, the purchase price had been fixed on the basis

of cost, less depreciation, plus 10 per cent., which the directors considered fair and equitable. Referring to the recent rejection of the company's Parliamentary Bill, Mr. Tait said that, while that was to be regretted, certain amendments which were insisted upon would, in any event, have made the powers of little real value to the company.

Newcastle-upon-Tyne Electric Supply Co., Ltd.

The profit for the year ended December 31st, 1925, was £701,671, and to this was added £38,167 brought forward, making £739,838. Debenture interest absorbed £194,100, £150,000 was allocated to reserve for depreciation and contingencies, and £50,000 to reserve for plant renewals and improvements. The preference dividends are being paid, the ordinary shares receive a final dividend of 4½ per cent., making 7 per cent. for the year, and £41,517 is carried forward. The expenditure on plant renewals and improvements amounted to £44,503 during the year; this was charged against the appropriate reserve and the system was efficiently maintained out of revenue. The capital expenditure was £317,938, representing mainly extensions to high- and low-pressure distributing systems. The report mentioned the success of the company's issue of ordinary shares last year, and stated that Mr. H. A. Couves had been appointed general manager of the company. The meeting was held on Tuesday last.

South Metropolitan Electric Light & Power Co., Ltd.

The 1925 revenue account shows a balance of £217,718, which with £17,383 brought forward, makes available £235,095. Debenture interest absorbs £14,584, £2,500 is transferred to the taxation reserve, £45,000 to depreciation fund, and £115,000 to general reserve, and interim dividends required £20,750. This leaves £37,261, and after paying the final preference dividends and one of 10 per cent. on the ordinary shares (making 15 per cent. for the year), a balance of £4,011 is carried forward. The applications received during the year amounted to the equivalent of 1,676 kW, bringing the total to 30,101 kW, and the amount of energy sold rose from 26,066,809 to 29,653,143 kWh. The report states that inter-connecting mains are being laid between the company's generating station and the Barking station of the County of London Electric Supply Co., Ltd. Meeting: March 30th.

Metropolitan-Vickers Electrical Co., Ltd.

The directors' report for the year ended December 31st, 1925, states that the balance of profit and loss account, £178,167, added to the amount of £92,386 brought forward, amounts to £270,553. This has been appropriated as follows:—To general reserve account, £25,000; dividends on the preference and ordinary shares at the rate of 8 per cent., £150,495; carried forward, £95,058. The orders for the year showed a small increase over those for the previous year, a falling-off in home orders being offset by an increase in export orders. Prices still show no improvement on account of continued severe competition. In addition to ordinary current business, the company received during 1925 its full share of important contracts, which will contribute materially to a normal output from the company's works during the current year, and some of which will extend well into the year 1927.

British Aluminium Co., Ltd.

The report for the year ended December 31st, 1925, states that the net profit amounted to £550,434. The addition of £21,243 brought forward gives an available total of £571,677. After meeting debenture interest, &c., and allocating £50,000 to depreciation, £150,000 to reserve, and £10,000 to staff benefit fund, there remains £168,062. The preference and interim ordinary dividends are paid, and the directors recommend a final dividend at the rate of 12 per cent. on the ordinary shares (making 10 per cent. for the year), together with a bonus of 2½ per cent. This leaves £24,959 to be carried forward. The reserve account now amounts to £550,000. During the year the capital expenditure was £64,416; full output was maintained and the demand for the company's products and the prices secured remained satisfactory. The meeting is to be held on March 30th.

French Companies.

The *Société Centrale pour l'Industrie Electrique*, of Paris, reports that the company participated in 1925 in the formation of various electrical undertakings and increases of capital, and co-operated with some distributing and manufacturing companies. Most of the foreign companies in which the Société Centrale is interested yielded results which were more favourable than previously and increased their dividends, while the French distributing companies experienced results which were satisfactory having regard to existing conditions. The net profit amounted to 4,161,000 fr., to which is added a balance of 673,000 fr. from 1924. It has been decided to pay a dividend at the rate of 40 fr. gross per share, or 8 per cent., this comparing with 7½ per cent. in 1924.

The *Société Française des Electrodes* recommends the payment of a dividend for 1925 at the rate of 50 fr. per share, as in 1924.

German Companies.

The *Insulated Wire Company (late Vogel)*, of Berlin, reports net profits for 1925, including the balance forward, amounting to 678,000 marks, as compared with 100,000 marks in the previous year. No dividend was paid for 1924, but a rate of 5 per cent. is proposed for the past year

The *Siemens-Schuckert Works Company* reports a net profit of 8,954,000 marks, as against 430,000 marks. No dividend was paid for 1923-24, but for the past year the rate is 6 per cent. Having regard to the fact that the Rhine-Elbe Union is on the point of participating in the proposed big German steel trust, there has been no pooling of the profits between the former and the Siemens and Schuckert companies for the year 1924-25 under the existing community of interests between the two parties; but should the trust not be actually brought into being, an adjustment of the accounts will subsequently be made.

Czecho-Slovakian Company.—*Skoda Works.*—Last week this company offered in the London market £2,500,000 of 7½ per cent. first mortgage sterling debentures at 95 per cent. The issue is charged upon the company's freehold properties, works and machinery, as well as upon Rumanian and Jugo-Slavian Government securities. The company claims to have the largest steel and engineering works in Europe under one ownership. It turns out steel ingots, castings and forgings, locomotives, gas engines, turbines, and other classes of machinery, and has a paid-up capital equivalent to £4,278,424.

Stock Exchange Notices.—The undermentioned securities have been ordered to be officially quoted:—

Auckland Electric Power Board.—£250,000 5 per cent. water power conversion and general extension purposes debentures, 1925, of £100 each, Nos. 1 to 2,500 (bearer).

Oxford Electric Co.—£10,000 6 per cent. debenture stock.

Adelaide Electric Supply Co.—£250,000 five and a-half per cent. redeemable consolidated debenture stock.

Enfield Cable Works.—47,944 ordinary shares of £1 each, fully paid, Nos. 202,057 to 250,000.

Siemens Brothers & Co.—100,000 ten per cent. cumulative preference shares of £1 each, fully paid, Nos. 450,001 to 550,000.

Dealings in the following have been specially allowed by the Committee under Rule 159:—

Petters.—Funding certificates (registered) in respect of preference shares.

Société Internationale d'Energie Hydro-Electrique.—325,000 6 per cent. participating preference shares to bearer of 250 fr. each, fully paid, Nos. 1 to 325,000; 325,000 ordinary shares to bearer of 250 fr. each, Nos. 1 to 325,000; 40,000 founders' shares to bearer of no par value, Nos. 1 to 40,000.

Application has been made to the Committee to allow the following to be officially quoted:—

Compania de Electricidad de la Provincia de Buenos Aires.—131,250 ordinary shares of £2 each, fully paid, Nos. 1 to 131,250; and 348,088 8 per cent. non-cumulative pre-preference shares of £1 each, fully paid, Nos. 1 to 348,088.

London Power Co.—Scrip, fully and partly paid, for £3,000,000 5 per cent. redeemable debenture stock.

Folkestone Electricity Supply Co., Ltd.—The report for the past year records a total profit of £38,800. After adding £1,498 brought forward and interest, and deducting debenture interest and preference dividend, there remains £32,793. The depreciation fund receives £13,491 and the reserve fund £7,000. Out of the latter fund £8,000 has been taken in connection with an employés' co-partnership share scheme. It is proposed to pay a final dividend of 6 per cent., free of tax, on the ordinary shares (making 10 per cent., free of tax, for the year), and to carry £1,499 forward. Negotiations have been completed with the Dover Corporation for a linking-up scheme, and a Special Order has been obtained conferring the necessary powers. Meeting: To-day (Friday).

Reports Held Over.—The annual meeting of British Insulated Cables, Ltd., was held on March 22nd, and that of the Metropolitan-Vickers Electrical Co., Ltd., on March 23rd. Reports of these meetings will appear in our next issue.

Midland Electric Corporation for Power Distribution, Ltd.—The net profit for 1925 was £173,307, an increase of £21,836. After allocating £40,000 to depreciation, £50,000 to reserve, and meeting debenture interest and preference dividends, it is proposed to pay a final dividend of 5 per cent. on the ordinary shares (making 10 per cent. for the year), together with a bonus of 5 per cent., and to carry forward £30,963. The distribution is similar to that of the preceding year. The capital expenditure during the year amounted to £108,155. The continued expansion of the company's activities has necessitated the raising of further capital, and the ordinary shareholders are to be offered 70,000 new ordinary shares at par in the proportion of one to four.

Waste Heat and Gas Electrical Generating Stations, Ltd.—The directors report a net profit of £27,019 for 1925, as compared with £25,908 in the preceding year. The balance brought forward, less £200 given to charities, is £13,053, giving an available balance of £40,072. A dividend at the rate of 8 per cent. is declared (1½ per cent. already paid), leaving £14,472 to be carried forward. The capital expenditure during the year amounted to £11,719, representing the balance of the cost of the completed Horden power station extensions. The aggregate output from the company's stations showed an increase of 13 per cent., but two of the stations did not operate during the latter half of the year. The meeting is to be held to-day (Friday).

British L. M. Ericsson Manufacturing Co., Ltd.—The directors report that the sales during 1925 reached a record figure, exceeding those of 1924 by over 7 per cent. Given stable conditions, the progress is expected to be continued during the current year. The profit, after allowing for depreciation of stock and repairs and maintenance, amounts to £99,171. After providing for debenture interest, depreciation, taxation, &c., there remains £66,174, to which is added £39,785 brought forward, making £105,959. It is proposed to pay the preference dividend, to pay 16 per cent. on the ordinary

shares, to transfer £65,000 to general reserve, and to carry forward £22,258. The 1924 dividend was the same, £15,000 was placed to general reserve, and £15,000 to special reserve. The meeting is to be held on March 30th.

Notting Hill Electric Lighting Co., Ltd.—The directors' report for 1925 states that the capital expenditure during the year was £34,525, bringing the total to £366,548. The available profit for the year is £91,091 (including £23,568 brought forward). After providing for debenture and note interest, and transferring £12,000 to depreciation, renewal and reserve fund, and £3,000 to special reserve, there remains £53,909. The payment of dividends, &c. (including 14s. per share, free of tax, on the deferred shares for the year) leaves £23,213 to be carried forward. The report makes the usual reference to the reorganisation of supply schemes. The meeting is to be held to-day (Friday).

Newcastle and District Electric Lighting Co., Ltd.—The annual meeting was held on March 19th. Colonel F. R. Simpson, who presided, in moving the adoption of the report, said that outstanding debentures and loans had been reduced. The capital expenditure during the year was £33,254, the principal item being £20,449 for extensions to mains, owing to the increasing demand for electrical energy. With regard to the supply of electrical installations on the hire-purchase system, the directors had adopted a scheme with a view to obtaining new customers in streets where mains had been laid, and they were considering the advisability of extending the system to other areas. The report was adopted.

Waygood-Otis, Ltd.—Presiding at the annual meeting on March 15th, Mr. H. C. Walker (chairman) said that he was able to give a satisfactory report. They were making progress with the development of their buildings at Falmouth Road, which, when completed, would give them a modern and up-to-date factory, capable of dealing with an increased business. The company had recently completed for Messrs. Harrods the most advanced lift installation in the country, which possessed a number of new features. The chairman read a list of important lift contracts for Home and oversea concerns, and said that escalators were in hand for the Morden Extension stations of the Underground Railways.

Rhondda Tramways Co., Ltd.—The net revenue for 1925 was £44,667, and the addition of £3,492 brought forward made £48,159. Rent, debenture interest, depreciation, &c., absorbed £17,877; £18,000 is transferred to reserve and renewals account; a dividend of 8 per cent. is paid on the preference shares; and £4,283 is carried forward. There was a decrease in the tramway profit owing to the condition of the coal industry, but the motor-omnibus undertaking continued to expand, and the net result was a substantial increase in the profit as compared with 1924. The meeting was to be held yesterday (Thursday).

Windermere and District Electricity Supply Co., Ltd.—The amount available for 1925, including £766 brought forward, and after paying debenture and bank interest, was £7,479. A dividend of 6 per cent. is paid on the 6 per cent. cumulative preference shares, clearing arrears to November 30th, 1913. During the year a proportion of the reserve fund was capitalised, and 7½ per cent. preference shares were allotted to holders of the preference shares in the proportion of one to five in satisfaction of 20 per cent. of the arrears of dividend. It is proposed to install a further Diesel engine and alternator.

Keswick Electric Light Co., Ltd.—The gross revenue and the working expenses both showed an increase during 1925, and for the first time the company is able to show a balance on the right side and to recommend a dividend at the rate of 6 per cent. upon the preference shares from the date of allotment, March 26th, 1925. These shares (4,000 of £1 each) were allotted to the Windermere & District Electricity Supply Co., Ltd., in payment for plant taken over and in discharge of arrears of debenture interest.

Llanelly and District Electric Lighting and Traction Co., Ltd.—The available profit for 1925 (including £901 brought forward) is £39,180, and after meeting debenture interest, &c., and transferring £3,500 to reserve, there remains £20,604. The directors propose to pay the preference dividend and a final dividend of 2 per cent. on the ordinary shares (making 5 per cent. for the year); a balance of £998 is carried forward. The report states that the depression in trade in South Wales adversely affected the company's revenue, but there are indications of an improvement. Meeting: March 30th.

Stewarts & Lloyds, Ltd.—The net profit for 1925, after providing £75,000 for depreciation, was £291,119, and the addition of the balance brought forward makes available £426,817. After paying the preference and preferred ordinary dividends, the directors propose to pay a dividend of 1s. 6d. per share on the deferred shares and to carry forward a balance of £94,146. The 1924 dividend on the deferred shares was 7½ per cent.

Mid-Cheshire Electricity Supply Co., Ltd.—This company (formerly the Northwich Electricity Supply Co.) reports a profit of £8,036 for 1925. It is proposed to place £1,500 to reserve, to write off £500 from new issue expenses, to allocate £620 as a bonus to the staff, to pay a dividend of 7 per cent. on the ordinary shares (against 8 per cent.), and to carry forward £1,100.

Gateshead and District Tramways Co.—The revenue for 1925 at £138,448 was slightly higher than that for 1924, and after meeting all expenses, including a provision of £10,000 for renewals, there remained a balance of £32 570, to which is added £27,207 brought forward, making £59,777. From this £2,313 is transferred to special reserve and £4,087 to sinking fund, and after paying the preference dividends the directors recommend the payment of a dividend of 10 per cent. for the year on the ordinary shares, leaving £31,410 to be carried forward. Mr. G. R. Hulme has been appointed to the board in the place of the late Mr. H. S. Day. Meeting: March 31st.

Jarrow and District Electric Traction Co., Ltd.—The total revenue for the year 1925 was £11,058, and the balance available, after meeting expenses and adding £3,187 brought forward, was £3,993. A dividend of 4 per cent. is paid on the ordinary shares and £1,596 is carried forward. Mr. G. R. Hulme has been appointed a director in the place of the late Mr. H. S. Day. The meeting was to be held yesterday (Thursday).

Salisbury Electric Light and Power Co., Ltd.—The report which was presented at the annual meeting on March 16th showed a balance of £7,763. A final dividend of 6 per cent., free of tax, was approved, making 10 per cent., tax-free, for the year, leaving £263 to be carried forward. The new generating plant has proved satisfactory, and a second similar set and boiler plant are to be installed.

American Telephone and Telegraph Co.—The recently published report shows earnings of $180,458,913 for 1925, and a net income of $107,405,046. After paying dividends ($9 per share) and transferring $6,000,000 to reserve, a balance of $20,360,620 is carried to surplus.

The Bell system shows total revenues of $741,299,709 and a net income of $136,502,931. Dividends totalling $93,242,657 were paid, and there was a balance of $37,914,694.

Chiswick Electricity Supply Corporation, Ltd.—The revenue for 1925 increased by £8,316 to £73,805, and the balance available (including £15,491 brought forward) is £19,902. The directors were to propose at last Wednesday's meeting that £5,000 should be transferred to general reserve, £3,768 refunded to consumers, a dividend of 16 per cent. paid, and £1,086 carried forward. The 1924 dividend was 15 per cent.

British Electric Transformer Co., Ltd.—The net profit for 1925 was £56,275 and the addition of £9,674 brought forward makes available £65,949. It is proposed to put £10,000 to reserve and to allocate £5,000 to depreciation. The preference dividend of 7 per cent. is to be paid for the two years to June 30th last. (Six months' dividend has already been paid), and £8,949 is to be carried forward. The meeting was held yesterday (Thursday).

Direct Spanish Telegraph Co., Ltd.—The directors recommend the payment of a dividend of 10 per cent. on the preference shares, less tax, and one of 10 per cent. on the ordinary shares, free of tax, for the year 1925. The preference shares have already received a half-year's dividend, and an interim dividend of 4 per cent. was paid on the ordinary shares.

Tyneside Electrical Development Co., Ltd.—The net profit for 1925 was £3,812, and the addition of £732 brought forward makes available £4,544. It is proposed to pay a dividend of 6 per cent. on the deferred shares (as in 1924), to transfer £500 to general reserve, and carry forward £744.

United Alkali Co., Ltd.—Out of a net profit of £391,085 for 1925, plus £100,391 brought forward, the directors propose to pay a final dividend of 6 per cent. on the ordinary shares, making 10 per cent. for the year, and to transfer £100,000 to reserve (making £1,100,000). £103,709 is carried forward.

International Automatic Telephone Co., Ltd.—The profit for the past year was £109,523, comparing with £31,592 for 1924. A dividend of 10 per cent. is to be paid on the ordinary and deferred shares, as against 6 per cent. in the preceding year.

Automatic Telephone Manufacturing Co., Ltd.—After allocating £50,000 to depreciation, and £20,000 to reserve, it is proposed to pay a dividend of 10 per cent. on the ordinary shares (as against 6 per cent.) and to carry forward £37,804.

Pinchin, Johnson & Co., Ltd.—The directors propose to pay a final dividend of 20 per cent. upon the ordinary shares, making 30 per cent. for the year, as in 1924, out of profits of £112,276. The reserve receives £15,000 (against £25,000), and £30,519 is carried forward.

British Engine, Boiler and Electrical Insurance Co., Ltd.—A final dividend of 14s. per share is being paid (making 27s. for the year). £20,000 is put to the pension fund and £10,000 to the contingency fund.

Rangoon Electric Tramway and Supply Co., Ltd.—A final dividend of 1 rupee per share is recommended, making 10 per cent. for the past year.

Northern Mexico Power and Development Co.—A dividend of 1¾ per cent. has been declared on the preferred shares in respect of the quarter ending March 31st.

Chadburn's (Ship) Telegraph Co., Ltd.—The directors recommend the passing of the preference dividend.

Howard & Bullough, Ltd.—A quarterly dividend of 6d. per share has been declared.

Stocks and Shares.

Monday Evening.

The principal feature in the electricity supply list this week is the strength of Underground Electric Railways of London issues. The Income Bonds have risen 3 points, the £10 shares are 10s. up, and the 1s. shares, Bus "A," as they are colloquially called, have put on a florin. These are very unusual movements for shares that in the ordinary way move but slowly in their prices. The advances are due to the announcement that the London General Omnibus Company has acquired controlling interests in four hitherto private 'bus concerns, and this, taken in conjunction with the proposals for the regulation of London traffic, is expected to work a striking alteration in the company's fortunes, whereby the whole group would be, of course, benefited. The buying of these descriptions has led to a little inquiry for the Underground Contingent Certificates, which are mere gambling counters, and the price of which stands in the neighbourhood of 6d. Districts are 1½ higher. London Electric Railway ordinary—a rarely negotiated issue—rose to 45. The London traction varieties have not altered.

The latest reports of the London electricity supply companies simply add to the story of the prosperity prevailing last year. Some of the companies are already taking steps in advance to let their shareholders see how dividend payments are likely to shape in the future, and, as it is around this particular point that speculation chiefly centres, any news or views is, and are respectively, acceptable. It would appear, from hints which have been thrown out, as though the companies intend to maintain, as far as they can upon the re-organised capitals, the dividends that have been paid during the last two or three years upon their stocks and shares, so that holders of the latter may not suffer loss of income. So much depends, however, upon the manner in which capitalisation of reserves is agreed as to invest the subject with uncertainty. Charing Cross ordinary have improved to 45/9 x.d., and the rest of the movements in this list contain no point of special interest.

Manufacturing shares are steady. British Aluminium rose a shilling to 40/6, upon the dividend being advanced from 10 per cent. to 12½ per cent. This was in accordance with general expectation, and the shares have been rising for some time past in anticipation of some such announcement. Cromptons are better at 16/9. English Electrics eased off to 19/-.

In the cable construction shares, Henleys at 3¾, Siemens at 32/-, and Johnson & Phillips at 3 are all better. The jobbers in this section state that there continues to be a very good tone about their market, but that business is quiet, considering, that is to say, the manner in which prices have been rising. Automatic Telephones are 1/16th up, recovering from the slight disappointment experienced at the time of the dividend announcement, when, although the rate was up to expectation, the accounts showed less profit than some people thought they should. Automatics are now 51/3. The International Automatic made a profit last year of £109,500, or 3½ times as much as that of the preceding year. The ordinary and deferred shares are to receive 10 per cent., as against 6 per cent. for 1924. The price has strengthened to 44s.

Marconi Marine has pleasantly surprised the market by publishing a report that shows an increased profit of £35,500, the net being £119,000. Nobody had looked for such good results in what was known to be a bad year for shipping. The dividend is repeated at 7½ per cent., and the shares came into demand at 20/-. No change was made, however, in the official quotation, and Marconis, the parent shares, were left at 22/6 middle, although, in actual fact, the market is better than this implies. The wireless section is harder throughout on this report of the Marine Company, but no fresh strength developed in the shares of the wireless manufacturing concerns.

Anglo-Argentine Tramways first preference weakened to 31/16, at which they are on offer. Brazilian Tractions fell 1½ to 92½, the Brazilian groups being somewhat out of favour. Mexicans are a trifle less depressed, Mexican Light common regaining 2 points at 32½.

Cable stocks keep steady. Westerns are lower, allowing for deduction of the dividend from the price last week. Anglo-American deferred lost another ⅛, although no serious importance is attached to the fact of telephone communication being recently established with New York. Radios remain dull.

Engineering shares responded with a rise to the averting, at the last minute, of the threatened lock-out in the trade. Babcocks promptly went up 1/9 to 53/9. But the iron and steel list is not happy, owing to the prospect that lies glumly ahead of conditions in the coal industry. Rubber, the produce, holds its rally to 2/6½ per lb. The share market is firm, without developing a great deal of activity. What fights against many of the Stock Exchange markets is the wholesale outpouring of new issues. This is a formidable factor in days such as these, the amount of money demanded for the newcomers being so large as to divert capital from existing channels of investment. With the new issues, the approach of the Easter holidays, and the early advent thereafter of the Budget, the Stock Exchange admits that no surprise can be felt at quietude pervading most of its departments.

Exports and Imports of Electrical Goods and Machinery in February, 1926.

ALTHOUGH it is pleasing to see that a substantial increase occurred in the value of electrical goods exported during February as compared with January (a longer month) and with February, 1925, the rise was insufficient to counterbalance the fall which characterised the January figure as compared with January, 1925. Thus in comparison with the first two months of 1925, the January and February total shows a decline of £223,280.

Reverting to the last month's figures, it is seen that the outstanding rise was in unenumerated electrical machinery, which was up by over 30 per cent. as compared with January last and February, 1925. Insulated wires and cables also made satisfactory progress. Batteries and accumulators show up well in the two comparisons, but telegraph and telephone apparatus higher than in the previous month, failed to regain the February, 1925, level. The decreases were comparatively unimportant with the exceptions of those in unenumerated electrical goods and apparatus, and submarine cable. The latter item, as we have frequently pointed out, is always subject to violent ups and downs.

There was a substantial fall (about 30 per cent.) in the import total, the decrease being general. Only two increases occurred, *viz.*, in batteries and accumulators, and carbons, and these were not of great significance. In both the unenumerated classes (goods and machinery) and in non-submarine cables, the fall was particularly marked; in the case of the last item, imports were halved. In comparing the figures with those for February, 1925, remarkable decreases are observed in the items telegraph and telephone apparatus, batteries and accumulators, and meters and instruments. The increases were negligible.

With regard to the re-export figures, it will be seen that a fairly general increase was nullified by decreases in three items. In the comparison with February, 1925, the large decrease was general, there being only three small increases.

So far this year the balance in our favour (including re-exports) is £2,284,086; in the first two months of last year it was £2,169,778.

Chromium Plating.

AT a meeting of the Electroplaters' and Depositors' Technical Society, held at the Northampton Polytechnic Institute on February 10th, Mr. E. A. OLLARD, of the Metropolitan-Vickers Electrical Company, gave a general survey of the present position of chromium plating and of its future industrial possibilities. The two qualities to which chromium owes its importance to the electroplater are its hardness and its resistance to corrosion. In regard to the former, it exceeds nickel and even steel, while in regard to the latter it will withstand atmospheric corrosion better than any metal, with the exception of gold and platinum, and it withstands the action of sea water and of all the common acids, with the exception of hydrochloric. Consequently chromium would long ago have been electrodeposited for protective purposes, for Bunsen produced it by electrolysis so far back as 1854, were it thrown down with the ease with which copper, iron, nickel, zinc, or silver are deposited. This, however, was soon found not to be the case, and a simple solution, such as that of the chloride used by the early workers, is erratic and unreliable as a source of the deposited metal.

Process of Plating.—Numerous solutions have been described and patented within the last few years, but all are based on chromic acid, to which are added chromium salts, such as the sulphate or carbonate. The solution in use at the Bureau of Standards, Washington, which has been published by Dr. Blum, is composed as follows, and most of the solutions advocated are variants of this:

Chromic acid (CrO_3) 33 oz. per gallon.
Chromium sulphate $Cr_2(SO_4)_3$ 0.4 oz. per gallon.
Chromium carbonate $Cr_2O.(CO_3)_2$ 1 oz. per gallon.

Freshly-made solutions work erratically, and it is only when they have been in operation for some time that they become reliable.

For reasons which are suggested by the theory of the process given later, chromium can only be deposited at a high current density, and about 200 amperes per sq. foot is usually employed. This accounts for the low "throwing power" of chromium, for unless the current density exceeds a certain minimum value no metal is thrown down. The difficulty is apparent where objects of irregular shape are to be coated. As a result of the high current density, there is very free gassing at the cathode and the current efficiency there does not exceed 30 per cent. Consequently, chromium anodes—even were they easily procurable—should not be employed, for their anode efficiency is 100 per cent., but the solution must be replenished by the addition of chromic acid. Lead anodes are the best to use and with these a terminal voltage of 8 to 10 is required.

The high current density used will overheat the bath and

therefore for continuous work cooling devices have to be employed. Another practical disadvantage due to the same cause is the liberal gassing which carries off chromic-acid spray as well as gaseous hydrogen. Fumes of this substance are dangerous and must be removed with proper drawing-off appliances.

The chromium as deposited may be either a matt grey in colour or bright, depending on the temperature, current density and composition of the solution. The matt deposit is easily polished. About 0.006 in. is deposited in an hour at a current density of 200 amps./sq. ft.

The Structure of Deposited Chromium.—X-ray analysis has elicited the interesting fact that whereas the crystal structure of ordinary chromium is based on a lattice of centred-cubes, that of the electro-deposited metal takes an hexagonal close-packed form. This difference in structure may account for the increased hardness of the deposited form, although further investigation is called for before any definite conclusions can be drawn.

The Use of Chromium as a Protective Coating.—Chromium can be deposited to adhere satisfactorily upon copper, brass, iron and steel, nickel and cobalt—among the common metals—but not upon aluminium, zinc, or cadmium. Hence there is a great field for it as a protective coating for iron and steel against corrosion. Now, although chromium is electropositive to iron, a thin, porous coating, which leaves the iron exposed in parts, does not protect against corrosion, as would be expected, in the way that zinc does. This is ascribed to the peculiar property of chromium of acquiring the "passive" state, which is negative to iron in the electrochemical series. On this account chromium will only adequately protect iron and steel against corrosion when the deposit is thick, or when an intermediate metal is interposed between the base and the chromium. Mr. Ollard carried out an extensive series of corrosion and tarnishing tests in which cadmium, nickel, and copper formed the intermediate coating. To protect against atmospheric corrosion the best results were obtained with copper; to be precise, steel plated in an alkaline copper bath for half an hour and then given half an hour in a chromium bath was completely protected against atmospheric corrosion. An hour or two's intermediate coating of nickel also gave good results. In regard to the corrosive action of steam spray it was found that chromium was practically untouched and sea-water spray, too, had little corrosive action upon it.

Thus far laboratory experiments; but chromium-plated articles in service have also been tested under a variety of conditions and satisfactory results obtained in the case of car fittings, bathroom and other household fittings; and table ware. Motor lamps in particular have stood up admirably against fog and damp and it is probable that chromium will eventually replace nickel, which is anything but satisfactory as regards resistance to atmospheric action. In the case of tableware, the slightly dark appearance—intermediate between silver and nickel—may prevent its general adoption as a substitute for silver plate, but its freedom from tarnish will render it admirable for restaurant and similar uses.

One of the original purposes for which chromium was deposited was as a substitute for silver in metallic parabolic reflectors, and although its reflecting power is not quite so good as that of silver its resistance to tarnish should make it preeminently suitable for this purpose. Some chromium plated reflectors are in experimental use in small lighthouses. Other promising applications are for the coating of metals for die-casting and for the coating of printing plates and of machine parts subjected to heavy wear. A valve face and seating in a pressure pump used with water containing a fine abrasive material has been successfully plated and has stood for two months, having previously worn badly in a week or two.

Cost of Deposition.—It has been suggested that the high voltage needed and other special features of chromium deposition may render the cost of the process prohibitive. While definite figures cannot yet be published, the experienced gained in Germany and elsewhere would seem to show that once the process has been standardised there is no reason to anticipate unduly high costs of working. The cost of energy in any case is a small percentage of the whole, but while the first cost of a chromium-plating plant will exceed that of a nickel plant, the speed of working will counterbalance that overhead charge, while the labour in both cases is substantially the same. In the opinion of Mr. Ollard, while it is not probable that chromium plating will at present replace nickel plating, a large number of industrial applications will be found for it within the next few years, and it promises to become a stable industry.

Science in the Cable Industry.

A Review of the Problems and Difficulties Encountered.

The wide ramifications of the application of science to the cable industry were indicated in an interesting paper by Capt. P. Dunsheath, O.B.E. (Chief of Research Department, W. T. Henley's Telegraph Works Co., Ltd.), before the Royal Society of Arts on March 3rd. Mr. Ll. B. Atkinson presided.

Cable making had been an art rather than a science, said the author, but as the result of the increased demand for cables embodying highly specialised features, there had been a growing interest in the scientific side, culminating, since the war, in a very definite movement in favour of industrial research.

Industrial research associations fulfilled a very important function in carrying out investigations of common interest to cable makers and users, and in effecting economies when the pooling of information between makers was possible through such organisations as the Cable Makers' Association. Such associations, however, had a definitely limited field, and, to claim the fullest advantages of the application of science, cable-making firms must also carry out research individually in close connection with the actual manufacture. Messrs. Henley's had taken the lead in building and equipping an up-to-date cable research laboratory.*

As a broad principle, the primary object of a works research department was not to carry out fundamental research. At the same time, the academic side, without being sought, was frequently found, and at Messrs. Henley's laboratory a proposals book was kept in which were recorded the many new problems that arose in the day's work. The book was the despair of all men who appreciated the shortness of human life.

The main object of the research department in a factory was to improve the product; as an example he said that a particular type of paper, which was very expensive, had been considered to be the very best and had been used for many years. Trouble was experienced in obtaining the desired test results on a certain batch of cable, and the research department's experiments proved conclusively that the paper, far from being the best, was one of the worst for the particular purpose; as a result it was dropped, the process trouble was eliminated, and production costs were reduced.

Another important function of the works research department was the scrutiny of technical literature, indexing for quick reference, and the running of a technical intelligence service for the benefit of other departments of the Company and its customers. Generally speaking, the cable user, in case of trouble or unusual propositions, welcomed the assistance of a scientifically-equipped cable maker, and the rendering of such service to customers had a distinct publicity value. For example, cellars invested with a curious fungus had to be wired for electric light; by an elementary study in mycology the Company was able to assure the customer that a certain type of cable would be immune from attack.

A wide field of science was covered by the cable maker; probably the physicist had the widest scope. Also, the chemist, who had not begun to run in a groove, as a unit in a research team, was second to none in importance. The value of mechanics, properties of materials, &c., was covered by the broad title engineering; for instance, trouble had arisen in one works owing to the annealed copper wire drawn in another works being too hard. The fault reduced output, but owing to the absence of a measure of the hardness or durability, which was not shown by any known mechanical test, it was difficult to trace the trouble to its source. The research department, therefore, had developed an instrument by means of which they were able to state the softness as a percentage figure which everybody understood and was able to check. In another case, a new test was developed and a special instrument designed to show the extent to which a given weight of different yarns used for lapping and braiding would cover a given area.

One of the most outstanding features which distinguished industrial from university research was the necessity for developing new types of physical tests. The Company had found it necessary to measure the viscosity of compounds many thousand times more viscous than the usual range of liquids previously examined. The viscosity of extremely good insulating materials was so high that in the past it would have been recorded as infinity, but the Company had made a special viscometer of extreme sensitivity that gave a definite value, which, of course, was not infinity.

Metallurgy, particularly the microscopic examination of metal structures (for instance, the study of lead-sheath extrusion) was a valuable aid. The criterion of efficient lead sheathing was largely a question of the perfection of the longitudinal weld, and the preparation of sections for microscopic examination by a technique which the Company had developed, enabled it to throw considerable light on the nature of the extrusion process.

A phenomenon which at times assumed importance was the skin effect: at telephone frequencies it was appreciable, whilst at radio frequencies it became a serious consideration. In order to overcome the difficulty the conductor must be made up of a large number of small wires insulated from one another, and twisted together in such a way that each one travelled alternately near the centre of the cable and near the surface. In this way the inductance of

* Elec. Rev., December 5th, 1924; pp. 859-60.

all the separate wires was made equal, and the current shared itself equally between them.*

The problem of the dielectric was of great complexity, and never were the many unknowns so baffling and, at the same time, so important as now. There was no connected theory that explained all the known experimental phenomena; they were being led more and more to the conclusion that the factor of fundamental importance was dielectric absorption, but they were still ignorant of its inner mechanism. Dielectric strength might be defined as the voltage required to rupture the dielectric, but unfortunately complications resulted from the time-voltage relationship. At very high voltages the time of application affected the breakdown strength enormously, while at lower voltages the effect of time was less marked, though apparently still present. A collection of cardboard models of curves, indicating the nature of this time-voltage relationship, was shown †, and a series of papers was exhibited which showed tree-shaped markings at certain points.

The telephone side was one of the most mathematical and complex of any of the problems that cable makers had to solve, and a considerable amount of science was required in dealing with the mechanical protection of a cable. For instance, single-core cable sheath effects were much more important than those in multi-core cables, and in certain cases (for instance, when a single-core cable was carried through an iron pipe) the effects might be positively dangerous.

Discussion.

Mr. Ll. B. Atkinson, chairman, referring to the availability of new and improved apparatus enabling research to be carried out more quickly than formerly, said that although they could not overtake new problems, they were now nearer to overtaking them than they had ever been before in the history of experimental work. He was glad that at the Henley Laboratory there was a special department for mathematical research, because when one had sound experimental data, mathematical research was a very rapid way of arriving at results which might take a great many years if the whole ground had to be covered in the laboratory itself.

Mr. A. A. Campbell Swinton, F.R.S., speaking of the impurities in copper, said he had reason to believe that the influence of hydrogen in metal was far greater than was imagined. The latest theory was that the difference between diamond and ordinary pure carbon was entirely a question of hydrogen, diamond being carbon with no hydrogen in it. Would the conductivity of copper be improved by the elimination of the hydrogen it contained?

Mr. Hochstader (Holland) pointed out that the ideas of the engineers in different countries differed a great deal on the question of high-pressure cables, whilst measuring apparatus for power cables had been developed on somewhat different lines in the various countries. He suggested, therefore, a more free exchange of views internationally, so that the best qualities of each could be incorporated in one standard apparatus.

Mr. G. L. Addenbrooke also appealed for co-ordination of the vast amount of research work which had been carried out all over the world in connection with cables. A great deal of work had been done over and over again, and a great deal more was likely to be done much more extensively than it need be if some of the fundamental principles were better known. Therefore, he urged that some attention be devoted to those general principles.

Mr. W. H. Patchell (past president of the Institution of Mechanical Engineers) said it was believed that cable faults occurred at the joints, but he had figures which he had obtained in America of faults on a thousand miles of cable (from 20,000 to 45,000 volts) which showed more faults in the cable than at the joints. Such things would continue to happen until they knew what dielectrics really were, and the ill-effects of air on the cable.

Sir George Sutton (W. T. Henley's Telegraph Works Co.), in proposing a vote of thanks to the chairman, touched on the question of co-operation in research. He pointed out that to-day there was money in research, and there was a tendency, therefore, for the researcher to keep his results to himself, but Capt. Dunsheath's paper was prepared at the expense of an industrial trading company which was willing to co-operate with others to the advantage of the electrical industry. In the works which he controlled, no electrician from the United States was refused admission, and although he himself, when visiting the United States years ago, had been refused admission to some of the largest works there, to-day he received invitations to visit them; that showed a growing appreciation of co-operation in research work.

A Direct-Reading Radiogoniometer.

The Directional Indication of Wireless Signals by Cathode Rays.

(Abstracts of papers read before the Wireless Section of the Institution of Electrical Engineers.)

In the three years or so since the Western Electric cathode-ray oscillograph first made its appearance in this country many uses of it have been described. Most of them have been chiefly of laboratory interest, although it has been obvious that the rugged assembly of the oscillograph marked a revolution in the design of such instruments and placed a powerful new weapon in the hands of working engineers.

Perhaps the most interesting and novel use of the device that has yet been described is its application to the direction-finding of wireless signals. An arrangement for this purpose is described in a paper by Messrs. R. A. Watson Watt, B.Sc. (Eng.), A.M.I.E.E., and J. F. Herd, A.M.I.E.E., in which a typical visual direct-reading radiogoniometer installation is outlined which is capable of indicating the azimuth of arrival of wave-trains, the duration of which need not exceed 0.001 second. The arrangements described by the authors are more particularly connected with their work on the investigation of atmospherics which is being carried out on behalf of the Radio Research Board established by the Department of Scientific and Industrial Research, but the device is equally applicable to radio signals, and its use in this manner is also dealt with.

A Novel Radiogoniometer.

The principles involved are very simple: Two fixed loop aerials (one north-south and the other east-west) are used, with their tuning condensers joined either to the plates of a cathode-ray oscillograph or to the inputs of amplifiers working to these plates. On the receipt of a signal arriving at an angle of ϕ with the N.S. aerial, e.m.f.'s are induced in the aerials proportional respectively to cos ϕ and to sin ϕ. In the oscillograph the cos ϕ voltage is applied to the pair of plates producing the vertical (N.-S.) deflection of the beam, while the sin ϕ voltage is applied to the pair giving the E.-W. deflection, this being true whether the oscillograph is joined directly or *via* equal degrees of amplification on each side. Their combined effects follow directly from the general principles of Lissajou figures, of which they are a very simple case. The resultant field opens the fluorescent spot into a line which makes an angle with the vertical (N.-S.) line of deflection the same as that which the signal makes with the N.-S aerial. The normal vertical line of deflection can thus become a N.-S. line on a compass dial from which any other direction of signal can be instantly read.

This is especially useful in the authors' directional work on atmospherics, as it enables—for the first time in technical history—the instantaneous directions of individual atmospherics to be determined. In the paper, results on such work are described, and excellent agreement is shown between the readings of the instrument and the directions of atmospherics proceeding from known thunderstorm sources.

In the reception of signals the indication of direction is equally instantaneous, and the apparatus can deal with two signals at once, even though they are on the same wavelength. In this case (assuming them to be from different azimuths), if the two stations are working at hand speed, two intersecting lines will stand out on a background in the form of a faint parallelogram. With two high-speed stations the lines disappear and the pattern becomes a bright parallelogram, having its sides parallel to the respective directions of the two signals. In the paper the authors offer a novel solution of the beacon-station problem arising out of this property. It is suggested that slowly modulated c.w. be used, the modulation being such as to occupy several seconds to vary the signal strength from maximum to some characteristic minimum. In this case no Morse would be required, and the apparatus could be used directly by a navigator, who would simply have to read the frequency and amount of the modulation of any beacon transmitters that were appearing on the oscillograph. As these would have different and characteristic values for each transmitter, reference to a list of these characteristics would give the bearings instantly.

The Directional Recording of Atmospherics.

The data which have, until recently, been available as to the incidence of atmospherics have consisted almost entirely of relatively brief and isolated observations based on aural estimates. There does not yet exist a sufficient quantity of comparable data, from well-spaced observing stations, over an adequate period, to present anything beyond the barest outline of the world distribution of atmospherics. The purpose of a second paper which was presented by Mr. Watson Watt (also by permission of the Radio Research Board) at the same meeting of the I.E.E. is to describe a simple pen-writing instrument which, despite many limitations and imperfections enumerated in the paper, does enable continuous records taken under comparable conditions at widely distributed stations to be obtained and compared without an excessive

expenditure of effort. The description is followed by the presentation of some data from a first group of such recorders, which is presented as typical of the minimal results to be expected from an international network of co-ordinated recording stations.

The directional recorder comprises teak framing which supports a frame antenna, belt-driven by a turret clock, and carrying a recording drum on which is inscribed the trace of an oscillograph pen that is actuated by the output of a multi-stage amplifier connected to the frame antenna. The nature of the data obtainable is indicated by samples which show the diurnal variation of intensity of atmospheric disturbance, the diurnal variation of apparent direction of arrival, and the location of apparent sources of atmospherics by a group of recorders. It is hoped that means may soon be found for placing at the disposal of those interested the whole of the data obtained, and it is suggested that the time has arrived for the organisation of an international scheme, which need not absorb much labour or capital, for the collection of data on the lines indicated. The author announces that a second step in such a scheme is being taken by the installation of two recorders, of the pattern described, at German meteorological observatories.

It is notable that of the five papers so far presented to the Wireless Section of the I.E.E. during this session—excluding the chairman's inaugural address—four have been by members of the Radio Research Board's staff. The excellent work being done by this Board was the subject of comment by Prof. J. T. MacGregor-Morris in the discussion.

The Supply of Electrical Energy.

The Report of the Weir Committee.

As stated in our last issue, the report of the Committee appointed in January, 1925, to review the National Problem of the Supply of Electrical Energy was published on March 12th; copies may be obtained from H.M. Stationery Office at Adastral House, Kingsway, London, W.C.2, price 2s. net.

The Committee consisted of Lord Weir of Eastwood (chairman), Lord Forres of Glenogil, and Sir S. Hardman Lever, Bart., K.C.B., with Sir John Snell, M.Inst.C.E., M.I.E.E., as technical adviser. Evidence was obtained from the Electricity Commissioners, and Messrs. C. H. Merz, J. M. Kennedy, J. S. Highfield, and R. A. Chattock; various sources of information were drawn upon, including a memorandum of January 2nd, 1925, from the Electricity Commissioners to the Minister of Transport, a report made by Messrs. Merz and McLellan at the request of the Commissioners under the late Minister of Transport, and a memorandum by Sir John Snell, with conclusions based upon it by a technical advisory committee comprising Messrs. J. M. Kennedy, C. H. Merz, and S. L. Pearce, under date April 23rd, 1925. The following is a *résumé* of the contents of the Report:—

After setting out the present position of the electricity supply industry in Great Britain, the Committee states that at the present rate of increase, *viz.*, 19 per cent. per annum, consumption will mount from the existing rate of about 110 kWh sold per head of population to 500 kWh by 1940 or thereabouts. This compares very unfavourably with other countries, some of which are at present consuming from 500 to 900 kWh per head.

Price has a very considerable effect upon consumption, and price can be reduced by (*a*) improvement in generation methods, and (*b*) improvement in distribution methods.

Dealing with generation, the Committee points out that the present parochial system grew out of the circumstances of the past, and is contrary to the technical considerations which experience in this and other countries has shown to be essential to cheap generation. These technical considerations may be summed up as: generation in large stations, favourably situated as regards fuel, water and load, with sets of comparatively large capacity; the minimum legitimate amount of stand-by plant; and the highest obtainable load factor. These considerations involve generation in a few efficient stations interconnected with one another.

By way of comparison with existing conditions, the Committee had a definite scheme for the whole country drawn up, showing, from a purely technical point of view, the best method of securing an annual supply of 500 kWh per head, and taking full cognisance of whatever was of value in the existing or immediately contemplated equipment.

The scheme, an outline of which is printed as an appendix, showed that it would be possible to supply energy at an average price of 1d. per kWh. The average price at present is 2.047d. per kWh sold. The Committee was advised that with existing conditions the average price could not be reduced below 1½d., and would probably not fall below 1¾d. In the former case the adoption of the scheme would result in an annual saving of £44,500,000 on the national electricity bill when the consumption had reached 500 kWh per head, and in the latter case £66,800,000. The scheme is based on the generation of all the energy required for the country in certain selected stations, and the construction of main transmission lines interconnecting the selected stations and joining up with the other stations and transmission systems.

The Committee is of opinion that, while it is essential, if the full economies are to be obtained, that the selected stations should be operated in accordance with a scheme for the whole country, it is not necessary that the stations should change ownership, and that, in fact, there are certain advantages in separate ownership. An element of control is, however, essential.

At the same time, under existing conditions, there is no authority which could create the system of interconnecting lines. The Committee therefore recommends that a new authority, to be termed the "Central Electricity Board," should be constituted, and that this Board should be required to lay down the system of interconnecting lines, and should, subject to appeal to the Electricity Commissioners, exercise the necessary control over the operation of the selected stations by means of contractual arrangements.

After full consideration of the various alternatives, the Committee concludes that there should be a virtual pooling of all electricity so generated. Any other method would lead to artificial prices on a marginal or by-product basis, and would be both unstable and unsatisfactory in character.

To obtain this virtual pooling, the contractual arrangements referred to should be of such a nature as to secure that the owners of the selected stations will act as agents of the Board. All the operating expenses, including capital charges, will be met by the Board, on whose account the energy will be generated. The owners of the stations will repurchase such energy as they require for their own purposes at cost price.

The stations will be operated in such a fashion that it will be possible to meet the requirements of all undertakers. At present many of these undertakers own stations of their own. As the cost under the scheme must inevitably be lower than the cost at which even the best stations can generate under present conditions, it follows that the Board will be able to supply these undertakers at a lower price than they can themselves generate at. The Committee thinks that the closing-down of inefficient stations will take place rapidly after the commencement of the new system, but, as a precautionary measure, it recommends that the Commissioners should have power to require the closing-down of stations after a specified period, provided a supply from the Board at cheaper prices was available.

By this means the generation of electricity will within a comparatively short period of years be segregated and operated in the most economical manner, and will be made available under the control of the Board in the best interests of the country as a whole.

Apart from technical considerations, the suggested segregation of generation can only be justified if it is undertaken, not as a private enterprise for profit, but as a public utility. The Committee therefore recommends (*a*) that the capital required by the Board should be raised by means of Electricity Stock guaranteed by the State as to principal and interest, and (*b*) that the Board should work on a non-profit-earning basis.

Apart from generation and main transmission, both of which will be under the control of the Board, there remains the question of regional transmission. At present the greater part of the industrial regions is covered by Power Companies whose duty it is to lay down regional transmission systems. There are, however, certain towns—generally of the larger class—which have special protective clauses in their Acts; in these the Power Company has no right to supply without written consent.

The Committee recommends that the Board should be empowered to give a direct supply to these towns. Other towns should be supplied through the Power Companies, but the price for bulk supplies should be controlled so that these towns may obtain the benefits of the cheaper energy afforded by the Board.

The parts of the country not covered by Power Companies can be divided into areas where there is a potential demand for power, and purely non-industrial areas. In these areas the Committee thinks that regional transmission and local distribution must be considered together. It finds that there are drawbacks to both Power and Distribution Companies, and therefore recommends that in future there should be a new type of company with power to supply for all purposes, but subject to a purchase clause operative after 50 years. The new type of company will be required to justify the area over which it applies for rights, but subject to justification the area should be unrestricted. The larger companies will be responsible for regional transmission and the Board should be authorised to lay down secondary lines to the smaller companies.

It is essential to see that the benefits of cheap generation should reach the consumer. This involves certain alterations in the present system of controlling prices. So far as Power Companies are concerned, the price to be charged by them for bulk supplies should be confined to cost plus a reasonable return on the capital actually expended for the particular supply. For other supplies they should be subject to a revised maximum-price clause. The Committee also recommends that the power to make up back dividends to the standard 8 per cent. should be repealed.

In the normal course of events the Board should not undertake local distribution. Distribution Companies, subject to purchase by a local authority, should have the right, within seven years of the expiry of their franchise, to require the local authority to declare its intentions.

As regards the financial effects of the proposals, the Committee thinks that the technical scheme will involve during the next 15 years new money to the extent of upwards of £250,000,000. Half of this will be required for distribution purposes and should be raised in the normal fashion. The guaranteed capital needed to place the interconnecting system on a paying basis is estimated at £25,000,000. This should be raised by the issue of Electricity Stock, to be guaranteed as to principal and interest by the Government. The remaining £100,000,000 will be needed for the erection of new, or the extension of selected, generating stations. This capital should be issued by the authorised undertakers concerned on the certificate of the Commissioners to the Treasury, with a Government guarantee as to principal and interest.

The Report deals finally with various points arising directly or indirectly out of the main proposals:—

(1) Standardisation of Frequencies.—This has been estimated to cost under 10½ millions gross and about 8 millions net. The Committee is not prepared to recommend the expenditure of this money except as part of a comprehensive scheme; nor is it prepared to make a recommendation without further detailed investigation. But provided the further investigation is favourable and the main proposals are accepted, it recommends that frequencies shall be standardised at the cost of the State. It suggests that the question of repaying the cost, without interest, at a later date through the operation of the Board shall be considered.

(2) Rating.—The Committee recommends that the system of interconnecting lines shall not be subject to rates.

(3) Railway Electrification.—The Committee points out that its proposals will profoundly modify the position, and suggests that the question shall be thoroughly investigated.

(4) Sales.—The Committee believes that with more scientific and up-to-date methods, very considerable savings can be effected at the distribution end. This is not a suitable subject for legislation, but any existing statutory disabilities should be removed, and every encouragement given to the improvement and development of this side of the business.

(5) Miscellaneous.—Recommendations are made for alterations in the conditions governing the giving of supplies, the utilisation of waste heat, water power, &c., and wayleaves.

Appended to the Report is an abstract of the Memorandum, prepared by Sir John Snell, on the effect of a main transmission system and of the generation of electricity in certain capital and secondary stations when an average consumption of 500 kWh per head is attained throughout Great Britain, with the technical advisory committee's conclusions based thereon. A third Appendix deals with the effect of interconnection on reducing the cost of generation, a fourth with the constitution, powers, and duties of the Central Electricity Board, and a fifth with load factor.

In a prefatory note the Minister of Transport points out that in framing the Electricity (Supply) Bill the Government has not accepted all the proposals of the Committee, and that the scheme detailed in the Report does not represent a definite proposal which would be adopted if the Bill were passed into law.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Electric General-Utility Tool.

The latest introduction of Messrs. B. E. N. Patents, Ltd., 00, Victoria Street, London, S.W.1, is the U.L.A. general-utility tool, fig. 1, which can, it is claimed, be used as a portable tool, as a bench tool or as a saw-bench. The illustration shows the device fitted up as a saw-bench. The table can be lifted clear of the motor, when the tool may be used for such operations as grinding and polishing. With the cast-iron base removed the tool can be used as a portable drill, &c. The motor is of the universal type, and can be supplied from stock for pressures of 32, 50, 115 and 230 volts.

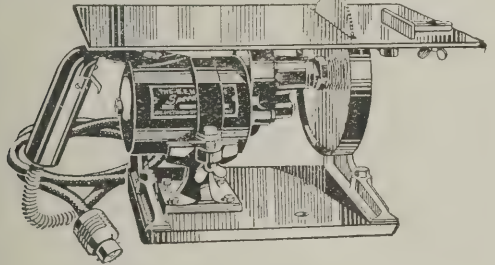

Fig. 1.—Electric Utility Tool.

A New Tumbler Switch.

We have received from Messrs. J. H. Tucker & Co., Ltd., King's Road, Tyseley, Birmingham, samples of their B4,000-model flat-type tumbler switch which was introduced to the trade recently at the British Industries Fair. It is available in two sizes, with normal ratings of 5 and 15 A at 250 V. Test reports show that the 5-A size has dealt successfully with a load of 33 A d.c., and that the 15-A switch has dealt easily with loads of 45/50 A; also that the 5-A switch has operated successfully on 525 V. d.c. The tests were made with the switch covers on at a switch-operating speed of 10 times per min., giving the cases little or no time to escape. The mechanical construction embodies the principle of complete positive action and of not using the spring as a "prime mover," but as an accelerator.

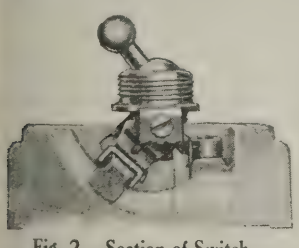

Fig. 2.—Section of Switch.

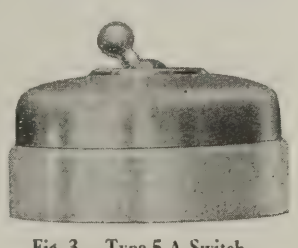

Fig. 3.—Type 5-A Switch.

The firm's usual quick-make and quick-break action is adopted, and an unsually long break is employed, fig. 2. The switch is claimed to be particularly suitable for operating electric fires and cookers and in connection with electric tramway and railway work generally, and in other cases where it is desirable to deal with loads and pressures not hitherto associated with tumbler switches. Fig. 3 illustrates the 5-A type. The switch base is of porcelain, and a neat external appearance is afforded. Both sizes are made in the surface, flush and combined switch-socket types, and the smaller size is made also in the semi-recessed type.

A New Electric Cooker.

The accompanying illustration, fig. 4, is of an electric universal portable oven cooker which has recently been placed on the market by Messrs. L. G. Hawkins & Co., Ltd., 30/35, Drury Lane, Kingsway, London, W.C.2. It is designed for all ordinary cooking, and is built with inner and outer containers on the vacuum flask principle, the element being wound round the inner container. It is claimed that by having the cooker on circuit for about 30 min. it may be disconnected, when the cooking operations will continue. This will render the device a suitable one for supplying a hot meal on a motor journey, &c. The loading is 500 watts. The inner or cooking chamber consists of a heavy aluminium lining surrounded with a thick wall of high-insulating material and encased in a protective steel shell. A tight-fitting insulated cover is held in place by two thumb screws, a safety valve permitting the escape of steam. Two 2-qt. food containers are provided with each cooker.

Fig. 4.—Portable Electric Cooker.

At a recent demonstration at the Ideal Home Exhibition, 2¼ lb. of beef, potatoes for five people, and nine cooking apples were cooked in two hours, the cooker being connected for the first 30 min. only.

A New Tramway Ticket Punch.

A new and ingenious form of ticket punch, which will deal with fares from 1d. to 1s., issue four classes of tickets, and indicate 24 different fare stages, is being experimented with on the Metropolitan Electric Tramway route between Muswell Hill and Bruce Grove. The machine, fig. 5, which has been designed by Mr. A. C. Aspinall, 81, Cannon Street, London, E.C., carries on the top a number of buttons, one for each value of fare and one for each class of ticket. Each button is

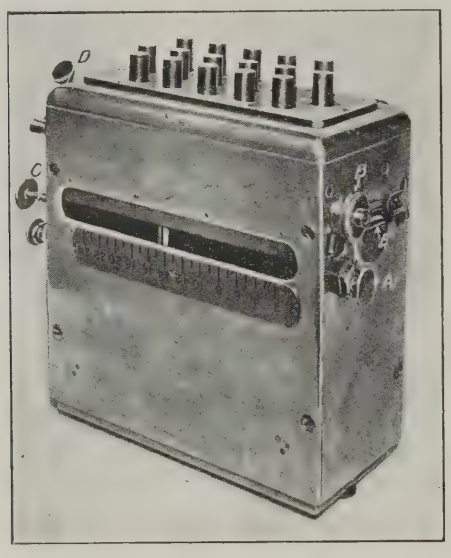

Fig 5.—A new Ticket Punch.

connected with a cyclometer dial which advances one each time the particular button is operated. On the left-hand side is a knob A for unlocking the machine, and also a milled disk B for setting the fare stage. On the other side is a knob C for ejecting the ticket, and also a lever D for punching the fare stage. A "window" on this side enables the serial number of the ticket to be seen. The buttons and the lever D are normally locked and are released by knob A. The operation of the value and class buttons punches holes in the appropriate sections of the ticket and the lever D is then operated to punch the fare stage. On pushing the knob C the ticket is ejected about ¼ in. from the ticket aperture E, so that it can be pulled out and severed at the proper point.

A "Feeding" Tool-Bar.

A useful tool-bar, known in the shops as a "feeding" bar, has been designed by Mr. J. T. Towlson, 9, Saville Road, Silvertown, London, E.16, for use in turning operations, when it can be substituted for the bottom member of the lathe compound rest, the feeding (in or out) of the cut being accomplished with the bar. It is intended primarily for use when it is required to improvise a "fixing" for a job away from the lathe altogether. The turning of the commutator of a large generator is facilitated, it is claimed, with the aid of such a tool, the armature being driven at a suitable speed. The commutator is stripped of the brushes,

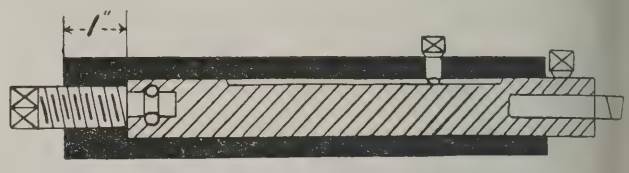

Fig. 6.—A "Feeding" Tool Bar.

and a lathe top slide of suitable length and travel is fixed and set parallel with the axis of the armature, the slide providing the means of traverse of the tool. Fig. 6 shows the bar in part section and part elevation. The device consists essentially of four parts, an outer case which accommodates an internal sliding element, the position of the latter being adjusted by means of a feeding stud screwed into the end of the case. The cutting tool is held at the other end by the sliding portion.

An Oil-Engine Development.

A recent introduction to the petrol-paraffin engine made by the Parsons Motor Co., Ltd., Town Quay Works, Southampton, has resulted in the running of the engine on gas-oil fuel of from 0.85 to 0.86 s.g. The gas-oil engine starts on petrol and changes over after a few minutes to the heavy fuel, and it is claimed to have the same range of flexibility. The new engine is said to be devoid of vibration, to weigh very much less, and to cost much less than the semi-Diesel type. Compressed air is not required for starting, and electric starting equipment can be fitted when required. The makers' standard high-speed sensitive enclosed governor is adopted and speeds below normal are obtained by a hand-lever control. The vaporiser is water cooled, and provision is made for trapping and removing any heavy residue.

Municipal Electrical Service.

The Colwyn Bay Bill and Local Contractors.

The clause giving publicly-owned electricity undertakings power to provide, let for hire, and sell electrical fittings and apparatus, and to wire premises, which a number of local authorities have included in Bills promoted in Parliament, was considered by a Parliamentary Committee for the first time this session in the case of the Colwyn Bay and Colwyn U.D.C. Bill. It came before a Committee of the House of Lords, presided over by the Marquis of Bristol, on March 17th, 18th, and 19th, and, in the result, was unanimously approved, the Committee stating that it was not necessary for the promoters to reply to the arguments advanced against the clause.

The clause was opposed by a number of electrical engineers, electrical contractors and other ratepayers in Colwyn Bay. Previously, before the Court of Referees of the House of Commons, it was held that ratepayers, as such, had no right to be heard.

Mr. W. E. Tyldesley Jones, K.C. (for the U.D.C.), recalled that a clause giving similar powers to those now asked for had been inserted last year in Bills promoted by the Bath, Burnley and Barrow-in-Furness Corporations, after consideration by a Special Committee of the House of Lords, and the matter had also been debated in the House. The position at Colwyn Bay was that the U.D.C. obtained electricity in bulk from the North Wales Power Co., and the price was reduced as the demand increased, so that it was in the interests of all to increase consumption. The use of electricity in the district, however, was not very great, being about 33 kWh per head of population. One factor which militated against the development of the supply of electricity in towns such as this was the initial cost of wiring and fittings. It was because that fact was recognised that a number of local authorities had asked for powers to sell fittings, and up to 1904 about 80 local authorities had been authorised to sell fittings or let them for hire. Then the Electrical Contractors' Association was formed, and it opposed a number of Bills in which these powers were sought; a clause was adopted and inserted in the Model Bill of the House of Lords, in 1912, which provided that local authorities with powers to sell fittings or wire premises should do so only through contractors. The Electricity (Supply) Act of 1919, however, gave power to local authorities to let fittings for hire and to wire premises, and had cut out the necessity for the intervention of the contractor. In 1923 the local authorities at Stoke-on-Trent and Wakefield had asked for selling powers, but were given powers to sell fittings only when the premises in which they were installed changed hands. In 1925 full selling and wiring powers, such as were now asked for, were granted in Bills promoted by the Bath, Burnley and Barrow-in-Furness Corporations. Wiring was an expensive matter, and the poorer classes could not afford it. The electrical contractors had no deferred-payment system, and had never suggested anything of the sort. Local authorities, on the other hand, had power to let fittings and wiring on hire. There was a risk that the tenancy of a house might change hands, and wiring installed for the previous tenant might not be required by the new tenant; when it was pulled out it was of no value, and constituted a loss to the local authority. A system of hire-purchase was better, and the U.D.C. asked for powers which would enable it to apply such a system. It was that which had converted Lord Strachie, who had spoken in the House of Lords in favour of the granting of the powers to local authorities, although he was an anti-municipal trader. The Colwyn Bay and Colwyn U.D.C. also supplied gas, and had power to sell gas fittings, but he had never heard it suggested by gas contractors that their business was injured because local authorities possessed those powers. He also pointed out that every electricity supply company in London had power to sell fittings, and, if it were part and parcel of, and reasonably incidental to the business of electricity supply companies, why should local authorities have their electrical undertakings hampered at the instance of the Electrical Contractors' Association? Some of those who were opposing the granting of these powers in the case of Colwyn Bay knew so little about electricity that they had asked the Electricity Department's

epresentatives how certain work should be done. One person who had been induced to sign the petition against the Bill had wired a house, and had had the work condemned by an insurance company as being dangerous; Colwyn Bay was hampered by the inability to get houses wired in a proper way. Dealing with the list of petitioners, he said that a number of people had been induced to sign the petition as ratepayers, although the Electrical Contractors' Association knew that ratepayers had no right to be heard, because their *locus standi* had been disallowed several times. As to a suggestion that ratepayers' money should not be used for carrying on such private enterprises as wiring and the supply of fittings and apparatus, because such a business might not be remunerative, Counsel said that the clause in the Bill provided that the business should be self-supporting. He dismissed a suggestion that, if these powers were granted, the inspectors of the Council would pass bad work done by the Council's workmen, and would condemn it if carried out by contractors, as being unworthy of comment.

Mr. J. D H. Osborn (chairman of the Lighting Committee of the U.D.C., which controls both the gas and electricity undertakings), gave evidence, and said that, judging from his experience with regard to the gas undertaking, if the powers now asked for were granted to the electricity undertaking there would be a great development in the demand for electricity. There had been an enormous increase in the consumption of gas

Mr. James Smith (electrical and gas engineer to the U.D.C.) gave figures to show that since 1921 the number of new electricity consumers was about equal to the number of new houses erected in the district, implying that the occupants of the older houses had not the facilities for having them wired, or could not afford to do so without a deferred-payment system. His figures also showed that the consumption per head of population in Colwyn Bay was 33 kWh, whilst the figures for other seaside resorts varied from 63 kWh in the case of Lytham St. Annes, to 87 kWh in the case of Bournemouth. Only three of those who had signed the petition, he said, could properly be described as electrical contractors, and only one of those was concerned solely with electrical work; the electrical business was only a minor part of the business of the other two. Their showrooms were inadequate, as were also their stocks of electrical apparatus. The remaining petitioners, other than those who were working electricians, were doing a little electrical work as a side line. In his view, electric cooking and heating would be very much encouraged in Colwyn Bay if consumers were able to obtain the appliances upon the hire-purchase system; recently there had been little development in heating and cooking. On the other hand, his figures showed that there had been substantial development of the gas undertaking, which possessed the powers now asked for with regard to electricity, and, if the powers were granted, he proposed to open an electrical showroom and to organise a campaign for increasing the use of electricity. The present load was almost entirely a lighting load, and if a heating and cooking load could be built up in consequence of the granting of these powers, the consumption could be increased and the price reduced, by reason of the sliding scale of charges for the bulk supply. The electrical installation work carried out by electrical contractors in Colwyn Bay, speaking generally, was of a low grade, and in some cases premises had had to be rewired before the supply could be connected. Cross-examination was directed to show, in the first place, that the U.D.C. Electricity Department made as many mistakes as did the contractors, and Mr. M. N. Drucquer (counsel for the opposition) referred to cases in which consumers had been overcharged, and where faults had occurred. In one case, replied the witness, the trouble was due to a fault on the system of the North Wales Power Co., other cases mentioned by Counsel he had not heard of, and the overcharging was a matter for the accountants' department. It was suggested by Counsel that the Electricity Department had never attempted to let out electric cookers on hire. Witness disagreed, and said they had not been hired because the U.D.C. had no showroom. Counsel put forward the view that the people of Colwyn Bay were not the class of people who wanted cookers on hire or on the hire-purchase system, and in support of this he referred to a case in which a firm had advertised apparatus on the hire-purchase system in the local Press, without result. Witness, however, had not heard of it. In the course of further cross-examination, Counsel said that he did not oppose the granting of powers to the U.D.C. to open a showroom, but suggested that it could have a showroom without having selling powers. Witness replied that, on economical grounds, he would not recommend the Council to open a showroom for display purposes only. It was suggested by counsel that the electricity undertaking was in its present unsatisfactory position because there was no showroom, and because there was no initiative, and he pointed out that in Blackpool the consumption per head of population was 70 kWh, although the Corporation had not the powers now asked for. Witness said he understood that Blackpool had hiring powers, and when it was pointed out to him that under the Electricity (Supply) Act he also had those powers, he said he was not aware of that, or that he had power to open a showroom. Re-examined, witness said that he had done all that could be done to develop the undertaking, and had been met with the reply by prospective consumers that they could not afford to have their houses wired.

Mr. V. Chaplin (foreman of the Electricity Department) gave specific instances of bad wiring by independent contractors with which he had come into contact in his capacity as inspector, and said that men employed by contractors who were opposing the granting of the powers had asked him how certain installations should be carried out.

Mr. E. T. Sidebotham (a builder) gave evidence to the effect that the wiring of houses which he had built had been carried out unsatisfactorily by independent contractors in Colwyn Bay, with the result that he had employed his own men to do the work.

This concluded the evidence on behalf of the U.D.C.

Mr H. Anderton (manager of the Colwyn Bay branch of Messrs. William Anderton & Co., Ltd., electrical contractors) was the first witness on behalf of the contractors. He spoke of the keen competition existing among contractors in Colwyn Bay, and said that they carried out a good deal of canvassing. He had an up-to-date showroom. There was no demand for cookers and fittings on the hire-purchase system in Colwyn Bay, but, if there were, he was prepared to sell on that basis. He confirmed the statement made by counsel that a certain firm had advertised to provide apparatus on hire-purchase terms, without result, and said he had been informed that the advertisements had done the firm more harm than good. If the powers now asked for were granted to the Council, he was afraid that he could not secure orders in competition with it, and would be driven out of business. To the Chairman's suggestion that if good contractors existed in Colwyn Bay the Council would not use the powers, he was unable to reply, but he pointed out that if it did use the powers it would have preference over the contractors, because new residents would first approach the Council for a supply, thus giving the Council the opportunity of approaching them before the contractors could do so. The contractors were quite capable of supplying all the requirements of Colwyn Bay.

Cross-examined by Mr. Rowand Harker, K.C., witness agreed that the deferred payment system was desirable, and, in fact, his firm adopted it; when challenged he gave the names of consumers in Colwyn Bay whose premises he had wired on the deferred-payment system. He did not remember having sold cooking and heating apparatus in Colwyn Bay on that system, but he was prepared to do so. His practice was to obtain cash if possible, and he had never advertised his deferred payment system. Counsel pointed out that by another clause in the Bill the Council was asking for powers to run a showroom, and asked why the promoters had not opposed it. Witness replied that, in his view, showrooms under certain conditions were of assistance to electrical contractors. In the course of further questions, Counsel said he gathered that the point was that the contractors were anxious that local authorities should spend the ratepayers' money in providing showrooms and demonstrating to prospective consumers the value of electricity, but if a consumer asked that a particular piece of apparatus should be installed at his house, then he supposed the condition was that the person in charge of the showroom should refer the consumer to the contractor. Witness said that there were already plenty of showrooms in Colwyn Bay and he could not say why the petitioners had not objected to the clause. Referring to the case in which a firm had advertised electrical apparatus on the hire-purchase system in Colwyn Bay, witness agreed that the firm concerned had become insolvent. Counsel suggested that the advertisement in the local paper referred to was inserted as a sort of last hope just before the firm became insolvent and that they would not have been satisfactory people to have had a hire-purchase agreement with. Witness had no knowledge of an occasion upon which one of his workmen was alleged to have asked Mr. Chaplin for advice as to how to install a 3-phase motor.

Mr. Drucquer said that the Electrical Contractors' Association had always advocated showrooms but held that it was not necessary for local authorities to have selling powers. He quoted the case of Manchester, where the Corporation, although it had full powers, maintained an expensive showroom but sold fittings and carried out wiring only through the contractors. He would like to see the same thing done in Colwyn Bay.

Mr. G. H. Bevan (Messrs. George Bevan & Co., ironmongers, plumbers and electricians, tinsmiths and blacksmiths, of Colwyn Bay) gave evidence, and said that his firm had had a wiring department since the inception of the electrical undertaking and could have done the whole of the wiring necessary in Colwyn Bay in 1924 and 1925. They maintained an expensive showroom which would be sufficient to fulfil the needs of the district for the next 10 or 15 years, assuming that the development continued as at present.

Mr. Harker, having ascertained that electrical work constituted about one-third of the firm's total business, asked whether witness was really afraid of being driven out of business if the Council was granted the powers asked for. Witness said that he was not.

In reply to further questions, he said that he did not think it was necessary for the Council to provide showrooms. Asked whether he thought it reasonable that if the Council let fittings on hire it should not have power to sell them if the users wished to buy, he expressed the view that the Council should not be entitled to sell fittings under any consideration. Replying to the Chairman as to the suggestion that the Council, if it had wiring powers, would be in a better position than the contractors to obtain orders, witness said that when a house had to be wired he had to inform the Council, which could, if it wished, interview the prospective consumer and try to obtain the order for wiring, although he himself had done the canvassing. It was like going to a competing contractor and informing him that he had a prospective customer. He did not think the present engineer would do that, but his successor might.

(To be continued.)

Electro-Medical Radiation Apparatus.

The Artificial-Sunlight Exhibition.

At the Artificial-Sunlight Exhibition which was held at the Middlesex Hospital, Mortimer Street, from March 11th to 16th (Electrical Review, March 19th), a very interesting display of all manner of apparatus for radiating ultra-violet and other beneficial rays was seen, of which the following selected items are representative.

The stand of Messrs. Arnold & Sons was a large one and one of the most interesting exhibits seen on it was the new "Radial" type "Alpine" sun lamp, fig. 1. This lamp incorporates all the advantages of the preceding model, and in addition it is so arranged that it may be used to treat fifteen patients at one time. The arcs are arranged around a central cylindrical heavily-nickelled reflector. The lamp is entirely automatic and no rheostats are employed. The four arcs are arranged in series so that no energy is lost in reducing the pressure by means of resistances. Among the other exhibits on this stand were instruments for the analysis of lamp radiations, recording, by photographing the spectrogram in a quartz spectroscope, the ultra-violet present. Various wave-length spectrometers were also included.

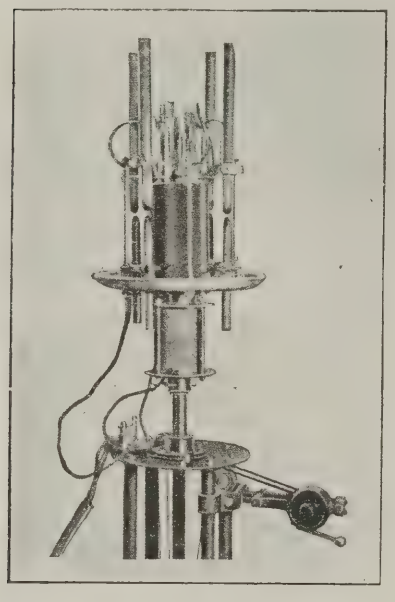

Fig. 1.—"Alpine" Sun Lamp

Fig. 2.—"Ultrozone" Set.

Messrs. Duncan Watson & Co. showed a variety of mercury-vapour lamps and the necessary hoods and accessories, the most recent production being the "Lasem" automatic lamp. A feature of the exhibits was a development of the Potter-Bucky diaphragm. This improved device is fitted with an automatic switch and relay for switching on or off and for taking the photographs.

A departure from the general radiation exhibits was seen at the stand of the Standard Ozone Co., Ltd., in the form of ozone-producing apparatus. Fig. 2 illustrates the "Ultrozone" set No. 25, with which the Broderip ward of the hospital was fitted during the exhibition. The set is made up of four units, each consisting of a silica tube with inner and outer electrodes. A pressure of 10,000 V is applied between the electrodes and the ozone is generated in the tube. Smaller portable, wall and table models were shown, together with a special surgical set for the local application of ozone. Besides the known beneficial effects of ozone as regards health in general, wide claims are made for it as a disinfectant and in this direction its uses in the hospital are almost unlimited.

The Sterling Corporation (Gt. Britain), Ltd., showed a fairly wide and representative range of apparatus. A feature was various designs of high-frequency equipment. It is made in two models, "A" and "Junior," and fig. 4 illustrates the "Junior" type. It is suitable for operation on pressures from 90 to 250 V, and can be supplied complete with a switchboard of polished mahogany, equipped with the necessary switches and connections and a series lamp. A table set consists of the switchboard model referred to mounted on a distinctive table. All sorts of peculiar applicators can be obtained for use with the instrument for the many methods of application and treatment. Another interesting exhibit was the automatic quartz mercury-vapour lamp, fig. 3. The method of striking the arc employed in this apparatus is interesting and the operation is fascinating to watch. The mercury is gradually forced along the arc-chamber, away from the "striking" electrode under gas pressure produced by means of a heating element in the gas chamber. The latter is connected to the arc chamber at the striking end by a tube which communicates the air pressure. A second chamber accommodates the mercury during the maintenance of the arc. It is interesting to note that the arc burns in the gas under pressure; the gas used is either neon, helium, or argon.

The General Radiographical and Surgical Apparatus Company showed several standard types of mercury-vapour lamps. A feature of the exhibit was the "Heliol" arc lamp, a carbon arc lamp, complete with switch and resistance, supported on a floor stand. A new form of portable electric-light bath was also shown. This is intended for bed use and may be expanded to cover any part or practically the whole of the body. Another item of interest was the "electro-atmos" apparatus. This consists of a small portable motor coupled to an air pump. By an ingenious arrangement of valves the compressed air is used for the vaporising of drugs and also for extracting pus.

Messrs. Allen & Hanburys, Ltd., and Newton and Wright, Ltd., had a good show of arc lamps, among which was the "Westminster" automatic arc lamp. This is of the 30-A type and is constructed to maintain a steady arc of 2½ in. for use with either "white flame" or impregnated carbons. Several types of mercury-vapour lamps were exhibited.

The cadmium photo-electric cell, designed for the quantitative measurement of ultra-violet radiation, was seen on the stand of Messrs. Watson and Sons (Electro-Medical), Ltd., who showed a representative display of arc lamps with carbon and tungsten electrodes.

The Western Dental Mfg. Co., Ltd., also had a good display of arc-lamp apparatus for complete or local sun baths.

A varied display of radiant heat and light apparatus was seen on the stand of the Dowsing Radiant Heat Co., Ltd. A feature of this exhibit was a specially designed "bath" cabinet, for home and institution use, employing powerful ultra-violet radiating incandescent lamps.

Messrs. Kelvin, Bottomley & Baird, Ltd., also had a fairly extensive show of sun-bath lamps and apparatus, including several models with ceiling suspension.

Among the other exhibitors were Messrs. T. Clark & Son, A. E. Dean & Co., Ozonair, Ltd., J. R. Quain, the Thermal Syndicate, Ltd., the British Hanovia Quartz Lamp Co., Ltd., the Hewittic Electric Co., Ltd., the Medical Supply Association, Ltd., Rouse & Sons, Ltd., Ajax, Ltd., and the Cox-Cavendish Electrical Co. (1924), Ltd.

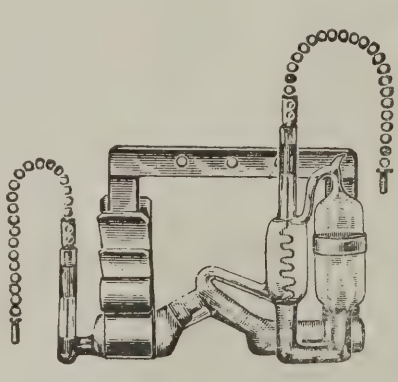

Fig. 3.—Automatic Mercury-Vapour Lamp.

Fig. 4.—High-Frequency Set.

Germany and British Protection.—*Reuter* (Berlin) reports that the Minister of Economics, Herr Curtius, speaking in the Reichstag last week on the Budget of his Ministry, stated that, as compared with 1924, Germany's total trade last year, amounting to 21.2 milliards, showed an increase of 30 per cent., but despite this improvement, Germany's share of the world's trade was only 8.5 per cent., against 13.1 in 1913. Germany's export trade, the Minister declared, was prejudiced by high tariffs, dumping, competition, and State subsidies of foreign countries. As far as England was concerned, Herr Curtius said that on no account need Germany tolerate, in view of her agreements with England, that England should introduce customs rates which were detrimental to German trade, and, if necessary, she would resort to the arbitration procedure provided in the Treaty.

The Electrical Development Association.

Annual Dinner.

The annual dinner of the British Electrical Development Association was held at the Hotel Cecil on Friday, March 19th, Mr. R. F. Sloan, who had been elected President at the annual general meeting in the afternoon, being in the chair. Among those present were the Rt. Hon. the Viscount Burnham, Sir John Snell (Chief Electricity Commissioner), Mr. S. L. Pearce, Sir Harry Haward, Mr. R. A. Chattock (President of the Institution of Electrical Engineers), Col. R. E. Crompton, Dr. S. Z. de Ferranti, Sir Benjamin Longbottom, Mr. D. N. Dunlop, Sir George Sutton, Major Isidore Salmon, Mr. R. B. Mitchell (president of the Incorporated Municipal Electrical Association), Sir Holberry Mensforth, and Mr. J. W. Beauchamp. The company numbered over 200.

Viscount Burnham, proposing "The British Electrical Industry," said that there could be no doubt that their position as a manufacturing country depended to a considerable extent on the electrical industry. Lord Weir's Committee had reported that the present position was the result of a parochial policy, and that not more than 50 of their generating stations were really suitable or efficient. At present in this country, even in the more forward districts, electricity was used for some purpose in only one home out of five, and for nearly all purposes in one home out of 50; surely that was a depressing return. This left out of consideration the application of electricity to the primary industry of the world—Agriculture—which was still in the pre-electric era, although he had read that in Sweden 15 per cent. of the total electric power was used for farm work and that over 40 per cent. of the farms were electrified. In England there were 418,000 farms, and no doubt in time most of them, especially poultry farms, could be electrified. It was of no use, however, pushing sales if the producers were not equal to the call, and in addition to increasing the production of electricity we must see to it that apparatus was improved by reducing the number of types, standardising the parts, and dividing their production among the firms best fitted to make them. There was also the question of salesmanship, which Lord Weir said must be improved by modern methods. The system of production and distribution would have to be thought out anew and drawn to new scales because electricity was fast passing from the stage of public utility to that of public necessity. They were only just beginning to learn the economic effects of short hours and high wages, which must be to make mechanical power, *pro rata*, much cheaper than it was ever before. Public utility supplies had a great effect upon the whole field of home industries and it was by their support that the manufacturing and contracting sides of the electrical industry lived and prospered. What those responsible for those supplies spent went far beyond the provision of employment in the industry, for it resulted in extending the name and fame of British manufacturing towns throughout the world. The brain counted for more than hands in the electrical trades to-day, and it was essential to maintain the highest skilled staffs. It was also essential, in order to increase the uses of electricity, to give the public more electric news and more electric reasons for faith in electricity.

Sir John Snell (Chief Electricity Commissioner), who made the first reply to the toast, said he was addressing a far larger audience, through the medium of broadcast, than those assembled at the dinner, and must deal with some matters with which they were already fully acquainted. He said that last year more than half the total electricity supplied in Great Britain from public stations was generated by 32 out of 494 stations—less than one-fifteenth of the total—and it took all the other 462 stations to generate the remainder, at a considerably greater average cost. In the United States, where the average consumption per head of population was four times that in this country, machinery was practically all electrically driven, whereas here only one-third of the total horsepower in industry as yet enjoyed this advantage. It was no effective argument against this estimate of 500 units per head in America, to say that there was already a great gas industry in this country in which some £170,000,000 had been invested. There were large gas undertakings in the United States, and the fact that a successful gas supply existed in the urban areas of this country was no obstacle to a great development of electricity supply. There was, in fact, room for both; the competition between them was good, giving rise to fertility of invention and enterprise in development on the part of both industries. They had to envisage the period when the public consumption in this country would be not 118 units per head per annum, as now, but 500 units, as was the position to-day in the United States. Personally, he had no doubt that they would greatly exceed that figure, and the point was whether they should do so by continuing along more or less haphazard lines or whether every effort should be made to bring the industry to the highest level of efficiency which it was humanly possible to attain. Speaking on the question of standardisation of frequency, Sir John said that it could be done without serious disturbance of the business of the many consumers now situated in the non-standard areas. It was the desire of the Electricity Commissioners to bring about as quickly as possible a supply of electricity throughout the country at a reasonable price. It was believed that the grid-iron of cables would not only render the supply more secure and make it more available for railway electrification, but that it would also help to decentralise industrial works and relieve the congestion in towns, assist in the development of model villages, and add greatly to the comfort of rural communities. The Electricity (Supply) Bill, 1926, would no doubt be subject to much discussion and criticism; he hoped all engaged in the industry would offer constructive criticisms, so that the Bill might be added to the Statute Book in a form which would ensure the highest and best development.

Mr. R. B. Mitchell (engineer and manager of the Glasgow Corporation Electricity Undertaking) also replied to the toast and said, in relation to the development of electricity throughout the country, that it was, perhaps, a pity that the bulk of the load which would be acquired would have to come from the gas industry, but that must be regarded as inevitable. The householders of past generations had been bred to the use of gas and to tolerate it, but the newer generation would not be content to have gas for lighting or to have their food cooked in an atmosphere of gas fumes. He expressed his strong belief in the work of the E.D.A. and in its effect upon the success of the electrical industry as a whole.

Col. R. K. Morcom, proposing "Our Guests," said the Government and the nation appeared now to have become one vast electrical development association. The new Electricity Bill was the subject of discussion everywhere; his own feeling on the subject was that that legislation was best which led most to individual resourcefulness, and that it was the duty of the Government to lubricate rather than to drive the machinery.

Sir Holberry Mensforth, K.C.B., who responded, said he was going to say something which might seem rank heresy to some of those present. In connection with many of their industries to-day they were living in a fool's paradise and making fundamental mistakes. If this country was to be prosperous they must do more to make themselves a productive nation and less of a distributing nation, towards which there was far too great a tendency. The productive side of industry in this country had received far too little encouragement. The prosperity of America was built on a basis of industry, not selling. They must see to it that they did not lose their staple industries, of which there was more than a danger, and in order to prevent their loss they must be made more attractive to the brains of the country. Greater attention would have to be paid to technical research, but even that was subservient to the great problem of producing more and producing cheaply. They were losing their skilled artisans, and if they became busy again they would be seriously handicapped in that respect. The whole problem of increasing their productiveness as an industrial nation merited the closest attention.

Major Isidore Salmon, proposing "The British Electrical Development Association," spoke of the progress that had been made in the short time the Association had been in existence, and asked what the present position would have been had the Association got to work in the early days of the industry. In addition to the importance of cheap electricity, there was the question of suitable and cheap apparatus. He did not believe that a great development in the use of electricity would mean a less consumption of gas, because there was a field for both.

The President, in the course of his reply to the toast, said that the revenue of the Association during the past year had increased by 200 per cent., which must be regarded as satisfactory and reflected great credit on the director, under whose guidance both the membership and the financial resources of the Association had been largely increased. The Council and the Executive felt that although good work had been done in the past there was still considerable room for further work, and the Association must prepare itself for a much more rapid development in the uses of electricity. A great deal had been said about the consumption per head of population, and it was quite evident that any measure based on the present Government proposals would stand or fall, depending on the consumption per head. There were certain modifications which would have to be made to make the Government proposals the really effective scheme they should be. Speaking of progress made on the domestic supply side of the industry during recent years, the President said that since 1922 the number of consumers on his company's mains had increased by 60 per cent., and he believed that by the end of the current year the number would be increased by 100 per cent. over 1922. That development, perhaps, had been due to the appreciation of the supply authority in that area of the need for development on the domestic side, and it was there that the Electrical Development Association had done such good work. He therefore urged everybody concerned with the industry to keep the ball rolling and not relax their efforts, and he assured those who were not members that subscriptions brought a very good return indeed. There must be concentrated effort to get householders to use electricity for as many purposes as possible, because it was no use having cheap electricity available in large quantities if it were not used in large quantities. Increasing sales was the primary object of the E.D.A., and therefore he urged everybody concerned with the industry to become a member.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Country-House Fires.

I enclose herewith an illustration, taken from the *Evening News* of March 17th, depicting an electric iron which has burnt through, first, the table, and secondly, the floor, and is suspended by the flexible connection in the room below.

Such incidents are by no means rare; the writer has had several cases brought to his notice, where irons have been left "on" in factories and similar places over the week-end, resulting in the iron being found in the room below.

It is not generally understood by the public that an iron will become red-hot in the course of an hour or an hour and a half, if left unattended. About 70 per cent. of users of electric irons have, from time to time, burnt table cloths, tables, floors, &c., through accidentally leaving the iron in circuit.

I am of opinion that the ordinary iron as now offered to the public will soon be superseded entirely by automatic irons, either thermostatically controlled, or controlled by grip-control switches.

Perhaps some of your readers can give particulars of similar accidents, within their knowledge.

A.M.I.E.E.

London, *March 20th*, 1926.

[We have previously illustrated an incident of this kind, the result of carelessness. Fires due to this cause, however, are almost unknown, and the great popularity of the electric iron shows that it bears a high reputation.—Eds. Elec. Rev.]

"Electrical Freedom."

Your editorial comment that Mr. Robinson is causing mirth because of his "working hard," &c., is a little unkind to your correspondents, and not quite justified.

We contractors must appreciate that Mr. Robinson is no fool; his views are no doubt the result of his experience, and are no doubt sincere. There is the question, however, whether Mr. Robinson has gone the right way about things and if his views would have been entirely opposite if he had approached matters rather differently. We shall see.

With your permission, Sirs, I would address my following remarks to Mr. Robinson:—

To quote your own words, Mr. Robinson, you want suggestions for "wholesome co-operation." There is a quotation which reads: "First cast out the beam that is in thine own eye." Mr. Alger tells us that your past policy has largely succeeded in driving electrical contractors out of your territory. Was this your idea of "wholesome co-operation"?

Do I understand that you now wish to make amends, and that you consider "wholesome co-operation" would now be better for the supply in your area? If this is your view, you will find that efficient contractors will return and will more than meet you half-way.

I imagine that you would admit that no gathering of sound and tried business men could ever be persuaded that you and your staff could be better and keener salesmen than a number of keen electrical contractors with their individual enterprise *together with your proper co-operation.*

If you defend your past policy, will you tell us what your serious efforts *have been* towards "wholesome co-operation"? Or will you let us have *your* ideas for future efforts? I would like to ask you a few questions:—

1. Have you ever offered to meet the contractors to discuss selling propositions? I refer to the three things (of mutual interest): wiring, apparatus, and current.
2. Have you ever notified contractors of the exact roads and streets where your mains are being laid, so that they could *more efficiently* act as your unpaid canvassers?
3. Have you ever discussed your various tariffs with contractors so that they may be the better able to advise their customers?
4. Have you ever tabulated and given your data regarding average consumption and cost of current to various classes of houses and works, so that these important things could be utilised?
5. Have you had a genuine feeling of good-will towards the contractors and a desire to meet them on equal terms and not treat them (or allow them to be treated by your staff) with indifference or condescension or by being autocratic? Believe me, these things are regrettably found only too often in supply station engineers and their staffs, and are distinctly harmful to progress generally.
6. Do you make pin-pricking regulations of your own, or work in part only to such I.E.E. regulations as appeal to you, and so more or less cause confusion?

Whether you answer the above things or not, you have in them a firm basis for wholesome co-operation, and they are worthy of serious consideration.

There is your opportunity (and I am led to think you are taking it) of upholding a good class of work through really active support of National Registered Electrical Contractors. There, I submit, is a valuable beginning to co-operation on our side, waiting and asking for you.

Much more could be written on this subject, but if your contribution will lead to some better results (which are unquestionably attainable) you will have no small measure of thanks from the industry generally.

C. J. B. Barlow.

Warrington, *March 16th*, 1926.

I have reserved my comments on Mr. Robinson's article in your issue of February 26th until I saw the answers by other electrical engineers.

I happen to be the head of one of the much-maligned contractors in his neighbourhood, and there are one or two things that he has said which I should like to contradict.

(1) Mr. Robinson is not selling 27 vacuum machines per week—unless one calls hire-purchase selling; the majority are secured by the public at 4s. 8d. per week.

(2) He says that contractors have sold no washing machines. Just before Mr. Robinson held his exhibition at the Hackney Baths (on which occasion he would not allow contractors in his area to exhibit), we held a demonstration for 14 days of a washing machine and sold four, and we should have developed this business, but for the fact that his exhibition took our customers to the Council. In those days we sold cookers and every electrical commodity; now, however, part of that business is stopped through the unfair municipal competition.

(3) At the latter part of last summer we undertook six installations at Mr. Robinson's "cost plus 20 per cent. prices." They were carried out in Henley's lead-covered cable at 21s. 9d. and 22s. per point with plain pendants. The larger price was for smaller installations, up to six lights. Generally there would be two flats in a house, and top floor and one ground floor, and the top flat of three lights had be to fed with, roughly, 50 ft. of 3/.036 or 3/.029 mains, with Tucker main switch and White's main fuses at the service end, and a pair of White's fuses in the flat; the supplying of the mains and switches turned any profit it might have been possible to make into a loss, especially when it was found that we had to pass rooms which did not require electric light *en route* to install the light in other rooms. The six orders did not yield 5 per cent. on the net cost, so either Mr. Robinson's estimating cannot be right, or my staff must have been very slow at their work, and since they are thoroughly good men and have been in my service for many years, I do not think that this is the case.

(4) It is not true to say that factories in the Hackney area are not equipped with other electrical gadgets than electric motors by contractors. Only a month or two ago we installed 24 electric irons in one factory, as well as four motors, plus electric light, and in all probability we shall install exhaust fans when the weather warms up, and this applies to every soft goods factory which we undertake to equip. We have equipped a great many more factories than Mr. Robinson knows about, but the majority are out of his district.

I took the trouble to write to our Town Hall a few weeks ago to get figures relating to the trading of the Borough. The turnover of the Sales Department last year was £14,441, and the net profit £342. I wonder how many business firms could afford to trade at these terms?

Let Mr. Robinson and his whole staff concentrate on reducing the price of the lighting unit, which is now 5d. to 3d., and the heating unit, now 1d. to ¾d., and he will not want to spend £1,000 per annum on advertising and propaganda. Electricity will sell itself in Hackney.

H. Linzell, A.M.I.E.E.

Hackney, N.16, *March 15th*, 1926.

The correspondence under this heading for the past few weeks has been both interesting and amusing, and I venture to add my humble views.

Mr. L. L. Robinson has a perfect right to carry on in his salubrious district as long as he is allowed to do so by his superiors, *viz.*, his Council and those all-important ratepayers who elect them. As for his views expressed so pungently and offensively to us contractors—if it were not for the effect that such statements (coming from an engineer to a London borough council) might have in some quarters, I would prefer to let him boil in his own fat, as he surely will do; alternatively, given enough rope he will hang himself; but unfortunately, Hackney ratepayers will suffer. Mr. Robinson has nothing to lose personally, but would he take the same course if he were spending his own money? Most certainly not!—as it is not difficult for any contractor who sells appliances, especially vacuum cleaners, to know that what he is gaining on the swings he is losing on the roundabouts, and whereas he puts the losses on to the latter account, he shows all profit.

It is worthy of note that Mr. Robinson has not only picked a quarrel with contractors; as your advertisement columns have shown for months past, the Hackney Borough Council "is black," and no E.T.U. man is authorised to work for it without permission. This probably accounts for Mr. Robinson being able to get the work done at so much less than a registered electrical contractor. Will he say that all his employés are being paid full rates, that he allows overhead charges to the full extent and then gives 20 per cent.?

He has evidently hounded all respectable contractors out of his district, or we would have surely seen someone from his area replying to his indictment, which was, after all, directed against contractors in general, but the contractors of Hackney in particular.

Surely this is a matter that could be thrashed out at a round-table conference, and I wonder, if the Contractors' Associations were to invite Mr. Robinson to such a conference, whether he would accept.

We must pull together to reach the end we are all anxious to attain, and therefore I say supply companies should supply electricity at the cheapest possible rates and be in a position to give all that is required in any part of their district without vexatious charges to consumers, and they have got all they can do if they do this.

Registered contractors will obtain all the necessary consumers and carry out the best work, but something must be done to eliminate the plumber-electrician and unqualified men, and the Government should be asked to do this by way of a instruction to all supply authorities that only work carried out by registered electrical contractors may be given a supply of electricity under the order.

Manufacturers should deal through the electrical trade only and stop the practice so prevalent of giving all and sundry "trade discounts," and then *bona-fide* contractors would stock and sell appliances.

All should interlink their respective departments, and even Mr. Robinson would not complain.

Watson, Marsh & Co., Brondesbury, Ltd.
MICHAEL WATSON, *Managing Director.*

London, *March 16th*, 1926.

Low-frequency Transformers.

I should like to call your attention and the attention of your readers to what is apparently becoming a common and misleading practice in Press references to low-frequency transformers. I refer particularly to the question of impedance, which, as every engineer knows, depends, in a reactive circuit such as a transformer winding, to a vast extent on the frequency at which it is measured.

This point is not appreciated by the average radio enthusiast, and therefore any statement of transformer impedance which does not give the frequency at which it is measured, is as misleading as it is useless.

Any transformer may have a comparatively high impedance at, say, 500 cycles, but this does not indicate that it will give good results, since the whole of the male and female speaking voices and the major portion of the fundamental notes are below this frequency, so that for an impedance value to be of any real use it should be stated at a periodicity of not higher than 100 cycles.

If the impedance is reasonably high at this frequency, good reproduction, particularly of the low notes, is assured.

It is sometimes suggested that the impedance of a transformer primary and that of the valve preceding it should be matched; one must say at once that this is quite wrong, and such a state of affairs should be avoided, if at all possible.

The object at which one must aim is to make the transformer impedance as high as possible, so that it is infinitely great with reference to the impedance of the preceding valve; under these circumstances the full amplification of the valve is obtainable, and the true amplification per stage may be calculated by multiplying the valve amplification factor by the ratio of the transformer.

It is only with transformers of comparatively low ratio, say from 3-4/1, that the above high impedance is possible, for which reason high-ratio transformers should be avoided as a rule, unless they are used following valves having very low impedances, under which circumstances the transformer impedance is still comparatively high compared to that of the valve, but in any case, really good results cannot be obtained under any circumstances unless the transformer impedance is very great, which cannot be the case with a high-ratio transformer.

John Baggs.

Manchester, *March 18th*, 1926.

The Government Electricity Scheme.

If Mr. Allcock knew his subject he would not make so many mistakes. He is now comparing 1924 *costs* which, incidentally, were *not* 3.29d. per unit, with 1926 *charges*.

If we were to change over to bulk supply, the material question is: What are we going to save? The only items we are going to save on are: Coal, oil, general stores, wages, and repairs, a total, if one takes 1924 figures, of approximately £1,400, equivalent to a generation cost per unit of 1.87d.; so that if I buy at 3d. to cut out my actual *generating* costs, my current will cost me 1.13d. per unit more. Sound finance for Mr. Allcock, maybe, but not for

C. Culmer Hodges.

Electricity Works, Dawlish, *March 17th*, 1926.

The Sludging of Transformer Oil.

I shall be glad if any of your readers who have had experience in the running and maintenance of h.p. oil-cooled transformers will assist me with regard to the following points re "sludging":—

(*a*) Apart from the question of increased temperature rise, is there any danger of flashing over when "sludging" takes place?

(*b*) Is there any simple test for detecting the early formation of "sludge"?

(*c*) Is there any remedy that one can apply, apart from that of entirely renewing the oil?

The capacity of the transformer in question is about 600 kW, running off a supply at 6,600 volts.

Transformer.

March 20th, 1926.

[No one knows more about this subject than the British Electrical and Allied Industries Research Association, from which our correspondent can no doubt obtain references to satisfy his inquiries.—EDS. ELEC. REV.]

The Cost of Living in Madras.

I was very interested in the letter appearing in your issue of February 5th, signed "A Twenty-five-year Resident of Madras," as I have lived in this city for exactly that period. I should, however, be even more interested if your correspondent would inform me where in Madras one can get accommodation at a boarding establishment, or a private house, for Rs.120/- per month. My experience is that the usual sum charged nowadays is between Rs.250/- and Rs.300/-. Also the rent of a "decent bungalow," given by your correspondent as Rs.125/- to Rs.200/-, would be far more correctly stated as Rs.200/- to Rs.300/-. Possibly there is a slight mistake in your correspondent's *nom-de-plume*, and it should read "A Twenty-five-years ago Resident of Madras." In the far-off days at the beginning of this century, when India was a place worth living in, the figures were approximately as given by your correspondent.

A Sojourner in Madras.

Madras, *March 4th*, 1926.

Legal.

A Receiver Sentenced.

AT the London Sessions on March 17th, John James, an engineer, was found guilty and sentenced to 12 months' imprisonment for receiving transformers and other articles, the property of Radio Instruments, Ltd. A police witness stated that, although the prisoner was drawing the "dole," he owned a motor-car, and, it was believed, a yacht and a motor-cycle.

Neufeldt & Kuhnke v. Wireless Headphone Distributing Co., Ltd.

IN the Chancery Division on March 18th, Mr. Justice Tomlin disposed of an undefended action by the plaintiffs, electrical apparatus manufacturers, of Kiel, Germany, claiming injunctions restraining the passing off by the defendants, of Arundel Street, Strand, W.C.2, of headphones bearing the plaintiffs' trade-marks "N.U.K.," "N. & K.," and "N.K.," as and for the plaintiffs' goods.

Mr. W. LAVINGTON, for the plaintiffs, said that the defendant company was formed by Messrs. Wolffe & James in furtherance of their fraudulent scheme. The plaintiffs were one of the largest firms of wireless and electrical appliance makers and they began the manufacture of headphones in 1921. When they began exporting them to England, Wolffe & James were among those who bought them. They wanted to become the plaintiffs' sole agents in this country for headphones, but others were appointed. When the latter applied for registration of the plaintiffs' marks in this country they found that the defendants had applied to register themselves as the proprietors of the "N.U.K." mark. They fought that application before the Registrar, with the result that they were successful and got the plaintiffs' marks put on the register. It was soon after that that the defendants formed the "N. & K. Wireless Headphones Distributing Co., Ltd.," whereupon a writ was issued, and on motion the defendants gave an undertaking not to use the letters "N. & K." in connection with the name of the company.

Several witnesses were called, including Dr. Richard Bruhn, head of the plaintiff firm.

His Lordship granted two injunctions, (1) to restrain the defendants from using any of the plaintiffs' marks as part of the name of any business dealing in headphones or other wireless apparatus, and (2) to restrain the selling or offering for sale of any wireless apparatus or headphones bearing any of the plaintiffs' marks, not being the plaintiffs' goods. He also gave them the costs of the action and granted an inquiry as to damages.

British Thomson-Houston Co., Ltd., v. W. A. Tunstill, Ltd.

IN the Chancery Division, on March 19th, Mr. Justice Lawrence had before him a motion on behalf of the plaintiffs to restrain the defendants, W. A. Tunstill, Ltd., from infringing their patent for gasfilled lamps.

Mr. TREVOR WATSON, in support of the motion, said his Lordship had last week granted an *ex-parte* injunction against the Novelty Co., and he would probably remember that the invoice for the lamps in that case was made in the name of the Novelty Co., and underneath were the words: "Proprietors:—W. A. Tunstill Co., Ltd." They had discovered that that limited company had gone into liquidation, and there was some doubt as to whether the sale of the lamps was in fact made by the limited company or by Mr. Tunstill him-

self. The only evidence they had then was the invoice. He (counsel) asked that the writ be amended by joining the Novelty Co.

His LORDSHIP asked who owned the business. Counsel said he was instructed that W. A. Tunstill, Ltd., were the owners. That company went into liquidation in 1924, and since then had neither bought nor sold lamps.

His LORDSHIP said that he wanted information as to who was carrying on the business. Counsel promised to do what he could to get the information.

His LORDSHIP gave leave to amend and continue the injunction until March 20th.

Theft of Electricity.

AT the Hendon Petty Sessions, on March 18th, George Edward Adams, an electrician, pleaded guilty to a charge of having unlawfully obtained a supply of electricity from the Hendon Electric Supply Co., Ltd.

For the company it was stated that cables had been laid to premises in Golders Green and sealed. One of the company's inspectors discovered that the seal had been broken and connections had been made. The defendant said that he had connected up the installation because the occupier of the premises was in a hurry and the company was said to be very busy.

The Bench imposed a fine of £5 and three guineas costs.

Fife Coal Co., Ltd., Sued.

IN the Court of Session, Edinburgh, on March 18th, an action was raised on appeal by a miner against the Fife Coal Co., Ltd., Leven, for £600 as damages for the death of his son. It was stated that the boy was playing on unfenced ground belonging to the company where there was a large structure carrying a transmission line to the collieries. The boy's father said it was easy and tempting for children to climb the structure in order to slide down the guy wire ropes. On climbing and reaching the cross-bracing rods the boy received a fatal electric shock. It was argued that the company should have enclosed the cable in a wooden box. In the Outer House Lord Morison allowed a jury trial on the record, but the second division dismissed the action as irrelevant.

Their Lordships were of opinion that as the accident happened about 20 ft. from the ground the boy was a trespasser, and the company had no duty of care towards him.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks must be lodged within one month from March 17th :—

C.V. (lettering and design). No. 466,551. Class 6. Electric carpet sweeping machines and vacuum cleaning machines. No. 466,552. Class 13. Electric lamps and irons. No. 466,553. Class 18. Electric radiators for heating and cooking stoves.—Clyde Valley Electrical Power Co.

Ormond Engineering Co. (lettering and design). No. 454 982. Class 8. Condensers, transformers, resistances and crystal detectors, all being component parts of apparatus for use in radio-telephony.—E. J. L. Delfosse, trading as the Ormond Engineering Co.

Ultra. No. 459,948. Class 8. Radio-telephonic and telegraphic receiving and transmitting apparatus and parts, telephones, loud speakers, transformers, and condensers.—E. E. Rosen & Co., 661-663, Harrow Road, N.W 10.

All-American. No. 459,373. Class 8. Audio- and radio-frequency transformers, power (push-pull) transformers, grid condensers and leaks, complete radio-receiving sets, variable condensers, and valve sockets, all being goods made in the United States.—All-American Radio Corporation, Chicago. (British representatives : E. P. Alexander & Son, 306, High Holborn, W.C.1).

Magnee (lettering and design). No. 465,105. All goods in Class 8.—R. H. Lewis, 22¼, Cazenove Road, Stoke Newington, N.16.

Tefaglad No. 464,149. Class 8. Telephone apparatus.—Shipton & Co., Ltd., 37, Tothill Street, S.W.1.

Belco (lettering and design). No. 458,881. Class 13. Electric lamps (ordinary).—Bell's (Leeds), Ltd., 5, Upperhead Row, Leeds.

Peter the Heater. No. 464,647. Class 13. An electrical appliance for maintaining temperature in internal-combustion engines and for drying and warming generally.—L. G. Hawkins & Co., Ltd.

High-voltage Safety Devices.—A very large number of fatalities and serious accidents have befallen as a result of the wide extensions of hydro-electric power lines in New Zealand, especially in the country districts where exposed sections of the high-pressure lines have been unable to stand up to the weather and have broken. In one case a live wire dropping across a wire fence resulted in several deaths; several other similar fatalities have occurred within recent months, and although safety devices have been on the market for some time, none has given satisfaction so far as the low-pressure lines are concerned; but a device just developed by one of the Power Board engineers appears to have satisfied a very critical test by the chief engineers of the Hydro-Electric Branch of the Public Works Department interested in the matter. The principle involved is an earth-leakage relay attached to an oil-filled circuit breaker at the transformer which trips the circuit breaker, completely "deadening" the line. Thus, it is necessary to find the fault in the line and effect repairs before the section can be restored.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

Electrical Manufacturing Reports.

THE review of electrical industrial affairs by the chairman of the B.E.A.M.A., published in our last issue, has been immediately followed by several interesting statements by chairmen of electrical manufacturing companies, which are summarised in our "City Notes" this week.

The statement made by Sir Philip Nash at the annual meeting of the Metropolitan-Vickers Electrical Co., Ltd., showed that during 1925 that company produced a record output, the tonnage of orders completed representing an increase of 5.2 per cent. over 1924. Excluding the supply business, there was a decrease of 3 per cent. in home orders, but this was more than compensated for by an increase of 4.68 per cent. in export orders. The year 1926 began with a slightly smaller volume of work in hand, but since then the booking of new business has proceeded satisfactorily. The company suffered from the same experience as some other concerns in respect of the falling off in orders for heavy electrical plant for the Home market, partly because of the unsettling effect of a legislative atmosphere. Sir Philip thinks that such manufacturing concerns must be prepared for progress to be arrested for the time being and for a further falling off in Home sales until the Electricity Supply Bill has made headway in Parliament. He said that it rested with Parliament to convert the Bill into an Act which would not restrict our operations, but would assist the power supply side of the industry to go straight ahead.

The export business tonnage booked by the company during 1925 constituted a record, and this high-water mark will be maintained during 1926, but once again this is only possible by working with the barest margin of profit. Though competition grows in severity, the works must be occupied so as to give employment and to absorb the heavy standing charges. Another point in regard to the company's export trade is its bearing on future developments at home. The largest units in practically every line of Met.-Vickers manufactures go abroad, and technical developments which do much to keep the concern in the forefront of the industry therefore "arise almost entirely from the needs of

the export market." In this way operations for export are placing the company in a position to tackle large contemplated developments at home which may ensue from the electrical legislation now before the nation. This is also the case in respect of railway electrification. The bulk of the traction work carried out by British manufacturers during the last three years has been for abroad; this furnishes both experience and reputation, but let us hope that the Home railways will soon be substantial customers in this department, though it seems to require little short of an earthquake to move them from their rut. Sir Philip Nash and Col. R. K. Morcom have both in recent speeches directed attention to the important fact that wherever railway electrification has been adopted, the results have more than justified the calculations upon which the schemes were based. The M.V. company has established works in Sydney and Melbourne for certain electrical manufacturing purposes in view of the Australian Government's declared policy of giving preference to local production, and it reports that the operations carried on there have resulted in a substantial profit during each year of the existence of the works.

Mr. A. F. Berry, in his speech to shareholders in the British Electric Transformer Co., Ltd., was able to report a very substantial improvement in trade and in profit earned, although the year did not yield a full share of work. He said it was wrong to assume that because electricity supply undertakings were prospering, manufacturers of electrical plant and machinery were also doing so; manufacturers, unlike electricity supply authorities, had no monopoly; indeed, they had to meet stern competition, and to some extent their general charges had to be borne by export work. He expressed a hope that less would be heard this year of British capital being expended upon foreign electrical equipment. Our factories greatly needed the work. The nature of one side of the company's business led him to mention the increasing popularity of domestic electrical appliances. We welcome every speech that is delivered stressing the immense importance of attention being concentrated upon the expansion of the domestic load. Mr. R. P. Sloan, the president of E.D.A., emphasised its value especially at a time of industrial depression such as has been experienced in his own area, and we hope that the current year will witness great progress in many areas whether there is or is not the incentive of industrial depression. As Mr. Berry mentioned, the growing domestic demand has undoubtedly begun to stimulate orders for plant, machinery, cable and switchgear. Domestic electrical development, in which we have made, comparatively speaking, such small progress, is one of the great hopes of the electrical manufacturing industry. It is unquestionably true that the Electrical Development Association has a grand work to do, especially at a time when the public mind is fixed on electricity. With Mr. Sloan as its president we believe Mr. Beauchamp and his staff will not be discouraged, but will be able to press straight forward.

The exceptionally improved results recorded by the British Insulated Cables, Ltd., and mentioned in the annual speech by Mr. James Taylor, were partly due to the completion of work under some large contracts which have been occupying attention for several years, but they were also attributable to the benefit of lower manufacturing costs owing to the large sums spent in recent years upon improving and extending the factories, and to the fact that the year yielded a record output. It is noteworthy that £300,000 was expended on works extensions and equipment during the year. Mention was made by Mr. Taylor of the bonus scheme under which the staff is rewarded according to the results achieved. He attributed the company's success largely to the arrangement under which some of the workers were paid partly by fixed wages and partly by bonus on output or work done, and whereby all the permanent staff were paid partly by fixed salary and partly by a bonus, the amount of the latter depending upon the dividend paid to the shareholders from year to year. The scheme has undergone readjustment consequent upon the bonus share distributions, but what has been done has proved it to be advantageous to the shareholders generally to give every member of the staff a personal incentive to produce the best results.

The Government and the Coal Commission.

The decision of the Government to adopt the Report of the Coal Commission and to institute the legislative measures necessary to give its recommendations effect is of direct interest to the electrical industry in several important respects. Fortunately there is a condition first to be fulfilled by those engaged in the coal mining industry—namely, that they also shall agree to accept the report and to carry on the industry in accordance therewith—and as it will take some time to arrive at that stage, the matter is not so urgent as it might otherwise appear.

The list of recommendations that would require action on the part of the Government, which was circulated after the Prime Minister had announced the decision of the Cabinet last week, contains some rather startling items, such as the compulsory amalgamation of mining properties, the State purchase of the mineral royalties, the granting of powers for local authorities to engage in the retail sale of coal—municipal trading with a vengeance!—and obligatory profit-sharing schemes; but those which more immediately concern the electrical industry are the proposals to assist the investigation of processes for the low-temperature carbonisation of coal, to establish a National Fuel and Power Council, and to extend the provision for research by the industry, with the support of the State.

These three propositions are more or less interdependent, and are so treated in the Summary of Findings and Recommendations at the end of the Report. The Commission contemplates "a closer connection of mining with the allied industries," the latter comprising gas, electricity, smokeless fuel, oil, chemical products, blast furnaces, and coke ovens, and suggests that "the development of electrical supply under the new proposals of the Government should be closely coordinated with the generation of electricity at the mines." This, it will be seen, is an exceedingly comprehensive and far-reaching conception, from which the imagination can conjure up fantastic dreams. Whilst the development of an efficient process of low-temperature carbonisation would unquestionably confer immense benefits upon the country, by the production of smokeless fuel, and of mineral oil in substitution for that which at present we have to import in large and increasing quantities; and whilst these processes inevitably involve the evolution of gas suitable for heating purposes and for the generation of electricity, we most certainly are not prepared to support their association with the coal mining industry in any way whatever. The extraction of coal is one thing—its utilisation is a totally different matter. The idea underlying this proposal, like that put forward by the Miners' Federation, is to bolster up the coal mining industry at the expense of other industries—to subsidise it in kind instead of cash—and we will have none of it. The mining industry must stand upon its own feet.

The establishment of a National Fuel and Power Board, which is an inherent part of the scheme, would not merely add yet another to the already too numerous controlling authorities and Government departments—it would undoubtedly tend to subordinate the electrical to the coal mining industry and impose new burdens upon the long-suffering shoulders of the electricity consumer. All these proposals lead in one common direction—towards the ultimate nationalisation of coal mining and electricity supply, a consummation which we believe would be disastrous to the efficiency and economy of both industries. We trust that our readers will give serious consideration to the dangers which they involve, and will resist their accomplishment by every legitimate means.

Industrial Relations.

For many years past the question of the relations between employers and their employés has been recognised as one of the most potent factors in industry. Thus the Committee on Industry and Trade was well advised to make industrial relations the basis of its second report. This report deals with a vast amount of information regarding wages, hours, and conditions in industry both national and international, and the review of the document which appears elsewhere in this issue does not pretend to be anything more than a guide to its contents. The Committee merely places on record the facts which it has elicited from evidence given before it, and from the study of foreign statistics, and leaves those concerned to draw their own inferences and formulate schemes in the light of the data thus gained.

In studying the latter-day phenomenon of higher wages being received by unskilled labour in "sheltered" industries than by skilled men in the exporting branches, the Committee adopts a non-committal attitude. In view of the complexity of the subject, involving the reconsideration of our position as an exporting nation, the Committee was no doubt wise in refraining from attempts to suggest a remedy. Another important matter studied is the comparative purchasing power of wages in this country and foreign states. This brings out the favourable situation of the North American continent, no less than the poor conditions prevalent in a number of Continental countries.

Upon reaching the main subject of the report, the Committee commends the British system of negotiation and voluntary settlements in industrial disputes, contrasting it with the attempts which have been made in Australia and elsewhere to enforce settlements by legislation. We agree with the implied view of the Committee that attempts to force either employers or workers to adopt any course by legal measures are foredoomed to failure, and we would add that endeavours of either party to impose conditions upon the other by economic measures (*i.e.*, strikes or lock-outs) are just as futile.

If any conclusions are to be drawn from the report, they are these: That the Whitley system, within the limits imposed by external economic conditions, has justified its existence; and that the study of workers' "welfare" is not only humane, but profitable.

At a recent Press gathering, Sir Arthur Balfour, the chairman of the Committee, stated that a third report, dealing with the condition and efficiency of industry, would be issued later in the year, and that this would be followed by a final report containing the Committee's conclusions.

The Census of Industry.

The disquieting news has lately been made public that the first of the preliminary reports of the Census of Production, recently carried out in respect of the year 1924, is not likely to be issued until the autumn, so that no date can be fixed for the appearance of the complete return. To be of service to the industrial section of the country and to justify the expenditure which a census entails, it is necessary for the results to be issued within a reasonable time. The delay is attributed in official circles partly to the fact that although they were sent out early in 1925, not all the forms have as yet been returned by manufacturers. It has, however, been somewhat tardily recognised that part of the blame is due to the fact that the forms sent out to producers were in many cases far too complicated. As an example of this kind, it may be mentioned that the engineering schedule was a formidable document containing 123 questions under 26 main headings; it has now been found that there are many firms concerned with only about half-a-dozen of these items, to which a much simpler form has lately been sent.

While it cannot be too widely known by manufacturers that the filling-up of the inquiry form is a statutory requirement which in the interests of all should be done as promptly as possible, it is equally important for those responsible for the publication of the Census returns to get them out quickly, as each month the information is delayed takes away part of their value.

The Electricity (Supply) Bill.

At the annual general meeting of the Southern Association of Gas Engineers and Managers in London, last week, Sir Arthur Duckham asked how the gas industry would feel if it were dealt with as a whole by a Bill like the Electricity Bill. According to *The Gas World*, "he thought they probably would feel very sorrowful and unhappy—and he was almost certain that that was the feeling of the electricity industry to-day. The Bill was by far the most Socialistic piece of proposed legislation that had ever been known. It was a Bill providing for Government interference in an established industry. . . . So far as the Bill would affect the gas industry, he believed it would be the finest thing that could happen, because for the next few years electricity development would be stultified." Nevertheless, Sir Arthur deprecated that view, remarking that the gas industry would like to see the electrical undertakings prospering and the country benefiting from the use of electricity for mechanical purposes.

Grateful as we are to the speaker for his kind words, we cannot but feel that electricity is indeed in parlous case when it is openly pitied by its rival. The worst of it is that Sir Arthur has accurately summarised the situation. The electrical industry regards the Bill in its present form with profound distrust and aversion; outside the ranks of its promoters, hardly a single voice is raised in support of its provisions. A powerful indictment of the Bill appeared in *The Times* of Monday last, from the pen of Mr. E. Garcke, who has witnessed the enactment and operation of the whole of the Electricity Acts from 1882 onwards, and earnestly protests against the "intolerable interference by the proposed Board with the responsible management of . . . the selected stations," and the discouragement of capital, and emphasises the fact to which we have repeatedly drawn attention, that relatively small economies can be effected in generation, compared with the large savings that can be made by cheapening the distribution of electricity. Mr. Garcke suggests that "all that is needed for the further progress of the industry is to give the Electricity Commissioners additional powers to overcome the artificial difficulties that exist in the way of the present undertakers marketing their product," instead of which the Bill imposes further restrictions and disabilities on existing undertakers, and "overloads the electricity supply business with Government officials and committees."

As we wrote the foregoing, the debate on the second reading of the Bill was in progress; the Labour Party was opposing it because it would not immediately bring about the nationalisation of electricity supply, whilst a number of Conservatives proposed its rejection because, in their opinion, it would inevitably have that result. The outcome of the debate, a report of which is commenced on p. 563, was that the second reading was carried by a majority of 325 to 127, and the Bill was referred to a Standing Committee.

Whilst going to press we have received from the Secretary of the Institution of Electrical Engineers a copy of a letter addressed to the Prime Minister on Monday, March 29th, which reads as follows:—

"The Council of the Institution of Electrical Engineers, after full consideration of the Electricity Supply Bill, now before Parliament, and the Weir Report, are of opinion that certain of the provisions in the Bill require material amendment, as they are based upon an imperfect knowledge of all the facts, and if embodied in an Act might be detrimental to the national interest.

"They therefore consider that it is of the greatest importance that the fundamental questions upon which the Bill is based should be the subject matter of an inquiry at which the various interests in the electrical industry may be heard before the Bill becomes law."

With this communication we fully agree, though the prospect of further delay is unpalatable—already progress in many quarters has been held up for more than a twelvemonth. It is a pity that such an inquiry was not held months ago. The sooner the whole question is settled and peace restored to a harassed industry, the better.

Electricity Supply at St. Helens.

Recent Extensions at the Croppers Hill Generating Station.

A public supply of electricity in St. Helens was first generated in 1896, by an a.c., 145-kW, 1,000-V experimental plant, erected by the Corporation at Warrington Old Road. The purchase of the tramway undertaking in 1897 by the Corporation brought about the erection of a new power station, combined with a refuse destructor, at Croppers Hill on the site of the present power station, to give a d.c. supply for lighting, power and traction, the supply being commenced in 1899 when the Warrington Old Road station was closed down. The original equipment at the Croppers Hill station consisted of two 125-kW and two 215-kW Mather & Platt d.c. generators, directly coupled to Willans & Robinson h.p. steam engines, four Lancashire boilers, and two Babcock & Wilcox water-tube boilers, the latter being used in connection with the refuse destructor. The station capacity was increased gradually to 1,840 kW in 1911, when an important advance was made by the installation of a 1,000-kW Westinghouse turbo-alternator, together with rotary-converter equipment, the introduction of e.h.p. a.c. enabling the Corporation to supply energy to the outlying districts. Additional turbo-alternators and the necessary boiler plant were installed as the load increased, including one 2,000-kW Dick, Kerr turbo-alternator in 1912, one 3,000-kW Westinghouse turbo-alternator in 1916, and one 5,000-kW Oerlikon machine of that description in 1921. In 1924 the output of the station reached 26,912,000 kWh; it became apparent that still further additions to the plant were essential, and the scheme for the recent extensions was formulated.

The new additions, which were inaugurated on March 23rd by the Mayor of St. Helens, Alderman Thomas Hamblett, J.P., include one 6,500-kW turbo-alternator and condensing plant, e.h.p. switchgear, one 1,000-kW motor-converter, one 40-ton electrically-driven crane, four 35,000-lb. water-tube boilers with mechanical stokers, a wagon tippler, coal conveying and elevating plant, the enlargement of the engine-house building, and the erection of a new structural-steel boiler house.

The turbo-alternator plant, fig. 4, was manufactured and erected by the Brush Electrical Engineering Co., Ltd. The turbine is of the Brush-Ljungström type, 3,000 r.p.m., and is supplied with steam at the main stop valve at 250 lb. per sq. in. at a temperature of 700 deg. F., with a vacuum of 27.5 in. of mercury. It is directly coupled to two Brush alternators having a maximum continuous output of 6,500 kW at 6,600 V, 3-phase, 50 periods, 0.8 power factor. All the main bearings, including the governor and thrust-block bearings, are lubricated by a continuous supply of oil under pressure from a rotary pump driven from the turbine shaft; a separate steam-driven pump is provided for use when starting up. The auxiliary pump can be automatically started in the event of the oil pressure falling below a predetermined value. A powerful automatic governor controls the movement of the governor valves through a pressure-relay system, thus obtaining most sensitive and positive governing. The governor can be adjusted at the turbine by hand operation, and also from the switchboard by means of electric control. The condenser is of the two-flow Brush surface type, capable of condensing 70,200 lb. of steam per hour when supplied with circulating water at a temperature of 80 deg. F., and it will maintain a vacuum of 27½ in. with the barometer at 30 in. The air extraction is effected by means of a Brush-Delas ejector plant having an air duty of 30 lb. per hour when consuming 450 lb. of steam per hour. The water is extracted from the condenser by means of a Drysdale No. 3 "Pervac" two-stage vertical-spindle centrifugal pump, capable of dealing with 86,000 lb. of water per hour, and delivering against a total discharge head of 47 ft., plus 28 in. of vacuum, when driven at 1,440 r.p.m. by a 10-b.h.p., 400-V, 3-phase, a.c. motor. Two motor-driven Drysdale "Bon Accord" pumps of the centrifugal type provide the necessary circulating water for the condenser. One of these pumps is driven by a 120-b.h.p., 480-V, d.c. variable-speed motor, and is capable of delivering 366,000 gallons of water per hour against a head of 50 ft. when running at 870 r.p.m.

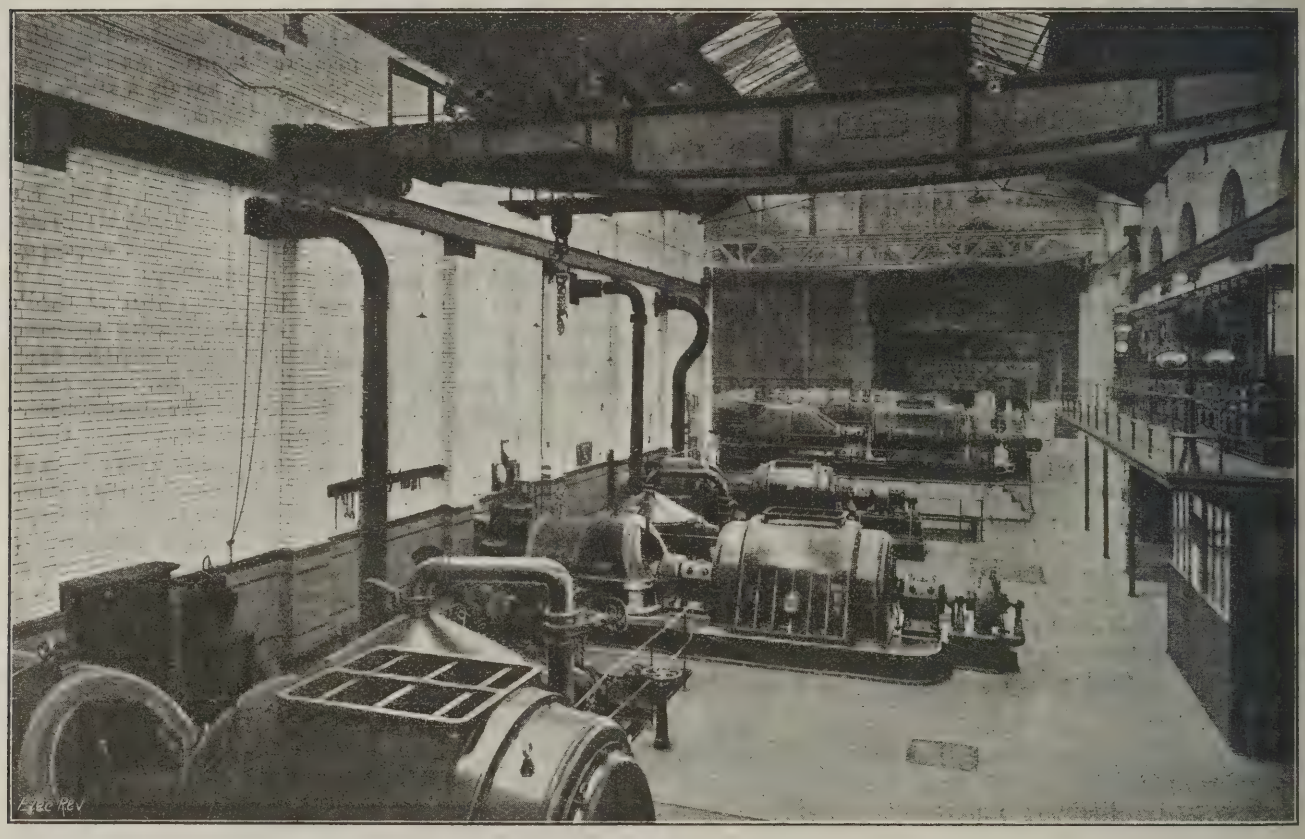

Fig. 1.—Turbine Room at Croppers Hill Station.

The second pump is driven by a 92-b.h.p., 3-phase, 400-V, slip-ring a.c. motor, and is capable of delivering 244,000 gallons of water per hour against a head of 50 ft. when running at 720 r.p.m. The cooling air for the alternators is supplied by a Standard & Oswald Stott fan, driven by a 47-b.h.p. motor, which delivers 24,000 cu. ft. of air per minute. The air is drawn through a Premier wet air filter, and a special alarm device is fitted to give a visible and audible signal in the event of the failure of the air supply. Electrical temperature thermometers are fitted at various points on the turbine, and these are connected up to an indicator mounted on an instrument panel. A Brady & Martin Kenotometer is provided for determining the efficiency of the condenser.

The e.h.p. switchgear was supplied and erected by the British Thomson-Houston Co., Ltd., and forms an extension to the main station switchboard. It includes the makers' standard 6,600-V solenoid-operated remote-control switchgear. The capacity of the oil switch is 1,200 A, the rupturing capacity being 180,000 kVA. The switchgear cubicle is of moulded stone, each compartment being provided with a sheet-steel door. An automatic voltage regulator of the Metropolitan-Vickers type is also provided.

The motor converter, fig. 4, supplied and erected by Messrs. Bruce Peebles & Co., Ltd., is compound wound, and designed for converting 6,600-V, 3-phase, a.c. to d.c. at 480/550 V. Fig. 1 is a general view of the engine room.

The overhead travelling crane is capable of dealing with any load up to 40 tons. For smaller loads up to 7 tons, an arrangement of chain gears is provided for rapid working.

The boiler plant includes four water-tube boilers, fig. 2, with superheaters, economisers, induced-draught plant, steel chimneys, grit arresters, soot-cleaning apparatus, a wagon tippler, coal conveying and elevating plant, coal bunkers, ash-handling plant and auxiliaries, including

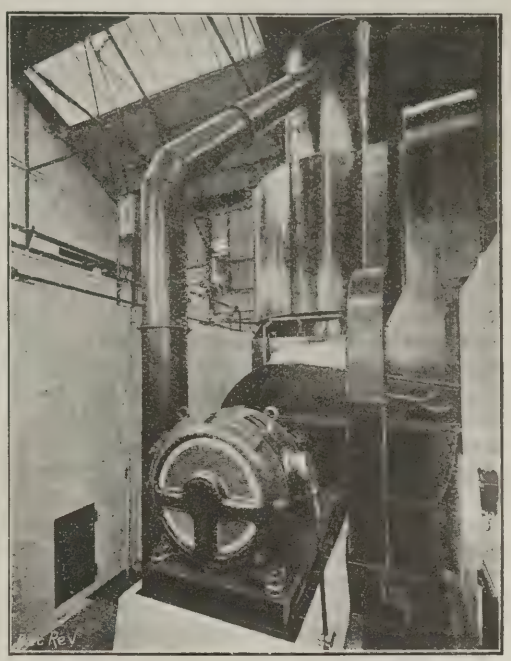

Fig. 3.—Induced Draught Fan.

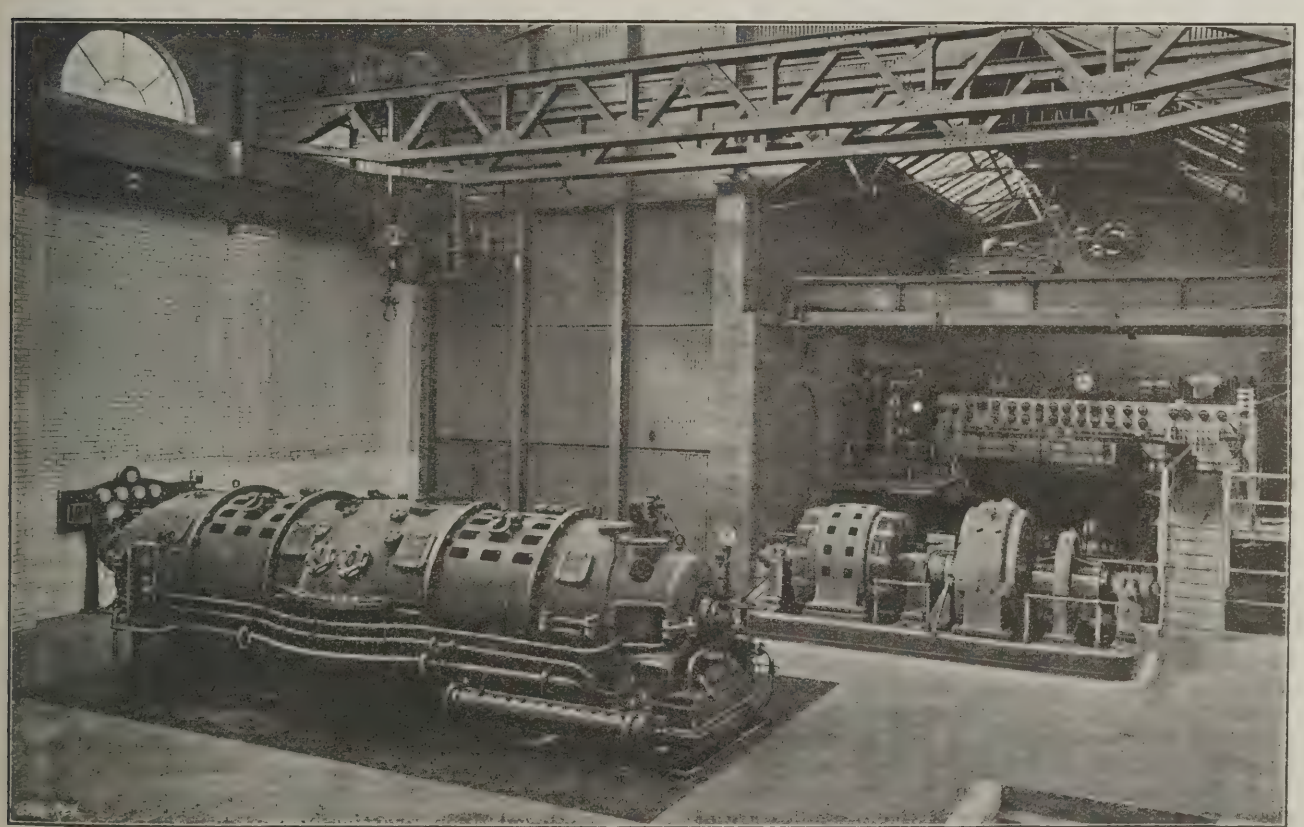

Fig. 4.—6,500 kW. Turbo-Alternator and 1,000 kW. Motor-Converter.

the steam ranges, supplied and erected by Messrs. Babcock & Wilcox, Ltd., and four type-"A" mechanical stokers and ash hoppers, supplied and erected by Messrs. Underfeed Stoker Co., Ltd. Each boiler has a heating surface of 8,019 sq. ft., and is capable of evaporating 35,000 lb. of water per hour, from feed water at a temperature of 110 deg. F., into steam at a working pressure of 265 lb. per sq. in. The external surface of the brickwork is cased with steel plates lined with magnesia slabs wrapped in asbestos. The superheaters have a heating surface of 2,581 sq. ft., and will raise the steam to 750 deg. F. The economisers are of the Green patent ringstay pattern, and each is equipped with 320 tubes arranged in two groups. One chimney and one motor-driven induced-draught fan, fig. 3, are provided for each pair of boilers. The chimneys are 7 ft. 6 in. in diameter, 150 ft. high, and are constructed throughout of steel plates. The fans are of the "Sirocco" centrifugal induced-draught type. A "Sirocco" grit arrester, fig. 3, is fitted to each chimney, and consists of an annular chamber built around the chimney into which the gases from the induced-draught fan are discharged. Adjacent to the inlet to the chimney from the annular chamber there is a patent shunt-type dust arrester connected by mild-steel piping to a cyclone type extractor. A connection is taken from the top of this extractor to the chimney for discharging the flue gases that are carried into the extractor back to the chimney. Each boiler is provided with a "Diamond" mechanical soot-blower installation of the valve-in-head type. To deal with the handling of the fuel, an electrically-driven rotating wagon tippler has been installed, and 12 to 15 wagons per hour can be dealt with. The fuel is tipped into a receiving hopper, 20 ft. by 13 ft., and falls into the elevator pit, whence it is taken by a gravity bucket conveyor and elevator and deposited into the coal bunkers inside the boiler house. The conveyor is capable of dealing with 40 tons of fuel per hour, and has a chain speed of 50 ft. per min. A set of coal-storage bunkers is provided, having a heaped capacity of 500 tons of small coal at 40 cu. ft. per ton. The ash-handling plant is installed in the boiler house basement, where the ashes are taken from the boilers by means of chutes into steel bogies. These are taken along a rail track to an ash hoist by which they are raised and automatically discharged into an ash bunker, prior to being loaded into railway wagons or carts for disposal.

The mechanical stokers comprise eight class "A.7.G." self-contained forced-draught travelling-grate stokers, each having a grate area of 192 sq. ft. Each pair of stokers is capable of dealing with $3\frac{1}{4}$ tons of coal per hour. Two forced-draught fans are fitted to each stoker, and these have cast-iron housings formed as part of the coal hoppers, and one 8-b.h.p., 480-V, direct-current totally-enclosed motor is utilised for driving each stoker and pair of fans.

In order to accommodate the new turbo-alternator plant, the original engine house, the Lancashire boiler house, and works office, have been demolished, the new engine-house extension being erected on the cleared site. The last of the old reciprocating sets have also been removed. The floor of the engine-house extension is 3 ft. higher than that of the other section, except a portion under the 40-ton crane where the original level has been retained to facilitate the loading and unloading of material. The new boiler house has been erected on a site which was occupied by the refuse destructor, so that this structural-steel building adjoins the engine house. The building comprises a basement, 12 ft. high, a firing room, 34 ft. high, and an economiser room, 29 ft. high. Ten compound stanchions support the fronts of the boilers, the coal bunkers and the firing and economiser floors, and extend from the basement to the underside of the main bunker cross girder, and ten roof trusses of 40-ft. span are fixed over the boilers, and are complete with ventilators. The roof is covered with asbestos sheeting secured to the steel purlins with galvanised hook bolts, and six lines of patent glazing extend the full length of the buildings, forming the roof lights.

It is gratifying to see that St. Helens has for a long period progressively held a very favourable position for high efficiency and low costs. For the year ending March, 1923, the working costs were 0.56d. per kWh sold, the average price per kWh being 0.96d. In 1924 the working costs were reduced to 0.49d. per kWh, and the average price per kWh was 0.84d.

In conclusion, we would like to express our thanks to Mr. F. N. Rendell Baker, A.M.I.E.E., the borough electrical engineer and manager, and to the Brush Electrical Engineering Co., Ltd., for their assistance in the preparation of the above particulars.

Second-hand Plant.

Its Waning Influence on Market Prices.

By E. GRAHAM.

Among the many post-war problems which the industrial section of the electrical industry has to face, the problem of second-hand plant has, of late, become pronounced. It is possible to trace qualitatively the history of present second-hand plant, and from that to obtain a clearer idea of current conditions than at the moment appears to be held by many.

It is insufficient to state that the present condition of affairs is simply due to the enormous boom which culminated early in 1921, and then suddenly fell away. While quite a true statement, it goes no further than the words comprising it. It does not, for example, say by just how much has the current situation been so brought about, nor does it say if the present state of affairs is likely to continue or not.

It is therefore interesting to trace the price career of a very representative industrial unit, *viz.*, a direct-current motor of D^2L value about 350 cu. inches. This armature core size represents a motor of the semi-enclosed type, developing about 15 h.p. at 1,000 r.p.m., a unit very comparable with the present actual average output unit. A certain representative maker turning out plant between the limits of 1 kW and 250 kW, reckons 12 h.p. to 25 h.p. per motor as the result of the fraction: total h.p. manufactured ÷ total number of motors sold over the last three years.

In accepting this 15-h.p. machine as representative due cognizance is taken of the fact that its manufacture is entirely dependent upon industrial conditions generally. The demand for the unit arises from those industries requiring means to aid them directly in coping with their own outputs. These concerns first require power and then the means to make use of it. The size of the unit, further, places it outside the range of the domestic load; which is to say, the domestic load only affects the demand for the unit through some other industry. As is well known, industrial electric motors are employed upon practically any duty one can think of: pumps, workshop drives, sugar making, baking, printing, cranes, anything in fact "from a needle to an anchor," so that the 15-h.p. unit chosen really constitutes a remarkably good barometer of industrial conditions generally.

It is to be expected then that any boom occurring in the electric motor trade would occur just prior to a boom in any industry making use of motors. Further, in view of the electric motor's extreme mobility of appli-

cation, it is to be expected that any boom would occur in its manufacture appreciably before a general trade boom. This is actually the case, as will be seen from a consideration of the curve shown herewith.

The graph shows the variation of a certain *maker's* price of the 15-h.p. unit chosen over the period 1913 to current date, and is rather remarkable in its shape. The actual values, while instructive, are of little moment for the present purpose, as the shape of the curve is the main clue to the subject.

According to official statistics of all kinds, but mainly B.O.T., the general trade boom attained a maximum value about January 21st, 1921. Some authorities date it considerably later, others a little earlier, but January 21st seems to be very near the mark. The main maximum of the curve given occurs in September, 1920, bearing out very well the remarks just made.

The law (so called) of supply and demand states, or infers, that the price rate of increase of any given article is proportional to the difficulty of obtaining the article, and similarly that the price rate of decrease is proportional to the ease of obtaining the article. An examination of the curve will show that the two slopes on either side of the main peak attain their maximum values about December, 1919, and March, 1921. The period between these dates is precisely the period of time over which the obtaining of plant of any kind was almost an impossible task. Buyers then could not get early delivery of anything. The reader will well recollect interminable discussions and complaints, in this and other journals, of ill-kept delivery promises and of the many panaceas put forward to cure the trouble. The maker of the industrial units here considered could not then undertake delivery of most orders under eight, nine, ten, and sometimes twelve months. The state of affairs was phenomenal, of course. Manufacturers all over were literally choked up with work. Agents simply had to sit still and stretch out their hands for orders as for tricks at cards.

All this is reflected (or perhaps, foretold) in the curve. From September, 1920, until August, 1921, the curve falls off rapidly, indicating that demand had fallen off, and that all work in hand had been completed. In its turn this caused a slightly better feeling to prevail, plant being more easily obtainable, as is shown by the curve bulging slightly until about April, 1922.

At this point it is meet to notice the dotted curve of second-hand prices for the same unit. This curve was plotted from sales catalogues to begin with, and latterly from second-hand advertisements in various journals. It therefore is not quite so accurate as the other, since the "new" curve is solely based on prices obtaining at the works. Second-hand figures plotted from two different consecutive sources are bound to cover the profits of at least two transactions. The shape of the second-hand curve is, however, sufficiently accurate for the present purpose, which is purely qualitative.

It will be seen that, about February, 1922, the market was evincing a decided tendency to firm up. The memory will recollect, too, that at this time many of our wisest financiers strongly advocated a rigid control, either by the Government or by the great trade associations, of the *rate* of that certain decapitalisation then prophesied. No heed was paid to their counsel, which is seen from the curve to have been wisely inspired. Instead, industry, seriously over-capitalised in plant, made a sudden dash for safety after April, 1922, by attempting to cut all losses as quickly as possible. The period tallies well with the average company's yearly audit. After the books for 1921 had been squared off, the serious position then divulged forced precipitate action upon all over-capitalised concerns, with the net result that plant of every description was practically given away in the mad dash for safety. The state of affairs then is again clearly indicated by the curve. It drops very rapidly from April, 1922, until well on into 1923.

The speed at which plant was got rid of by manufacturers, &c., was only paralleled by the avidity with which it was brought up by dealers of every class and kind. Any man and every man who had any spare cash at all bought plant, whether he knew anything about it or not. Some of them were "bitten," but it must be confessed that the majority have come off fairly well. At any rate the effect on the electrical unit was disastrous, and it was only in October, 1922, that it showed again any sign of steadying up. From that date until March, 1923, the fall was less rapid, the curve reaching a minimum value in March. By that time the gradual slacking-off of sales was beginning to have its effect, for, before the manufactured unit reached its lowest point, the second-hand machine had commenced to rise in value and to rise fairly quickly. That demand which is small, but persistently ever present, had begun to make itself felt once more, and acted conjointly with mutual buying and selling between dealers only. Coupled with the stress of the financial embarrassment of 1922/3, this caused a rapid appreciation in the value of second-hand plant. The more stable part of industry, however, clearly neglected the second-hand unit, so causing the new unit to steady up.

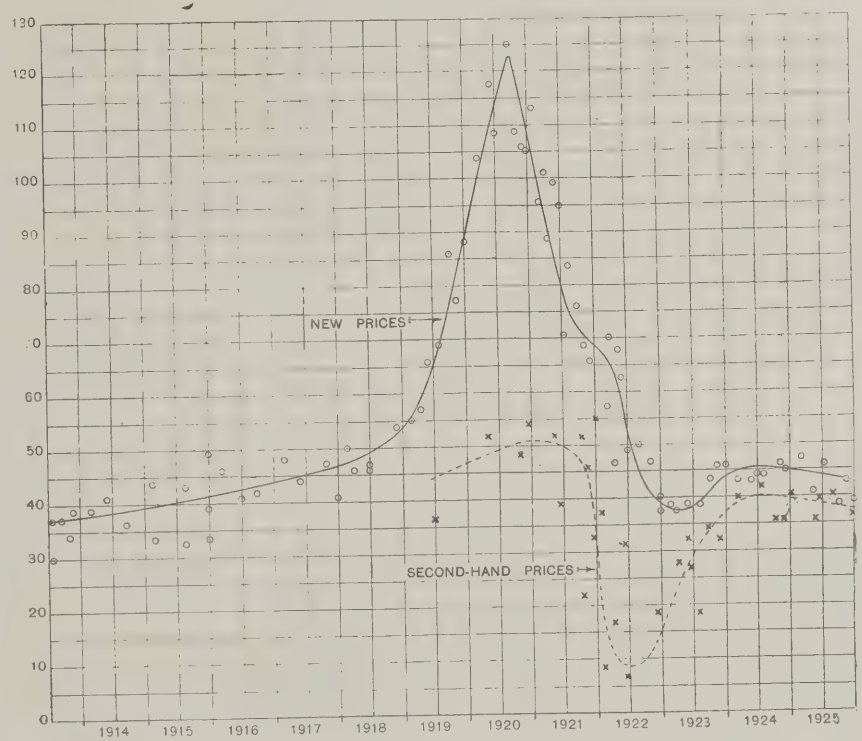

Fig. 1.—Variation in Price of a Certain Make of 15-h.p. Electric Motor.

Second-hand values attained a maximum about July, 1924, just as a flattening-out of the price of the new unit began to take place, indicating that the economic conditions necessary to cope with the small steady demand mentioned were, at that time, generally fulfilled. That is to say, the total amount of plant then capitalised stood at an economic figure.

This state still holds to date, for, at the point noted, the second-hand curve becomes appreciably steady, falling only slightly until to-day. It should be noted, though, that exactly steady figures of second-hand gear are not too easily obtainable now, and from the current falling-off of the new unit curve it is possible that at present the relative value of second-hand plant is a little lower than that shown. At any rate, it is not much higher, but however so, encouragement is to be found in noting that the difference betwen the two curves is only about ten per cent.: not too much when all is said and done.

and even this ten per cent. difference is now being wiped out, as the following experience shows.

A certain industrial electrical concern of late has instituted a thorough system of searching the second-hand columns of all the most important daily papers in the country. Where a second-hand machine is advertised for, a new machine is immediately offered at a very keen figure. True, the total number of advertisements is not great. About a dozen per week is reckoned a good figure, but the firm estimates that out of every twelve quotations submitted in this manner, two orders result, and these mainly from new customers. Other firms are very likely acting similarly, and it is quite likely that the major portion of the remaining ten machines is secured against the second-hand plant in a similar manner.

Thus the curves cannot be widely out, and the obvious moral is that things generally are approaching a condition of stability once more.

That present new prices are so competitive means that dealers now selling second-hand gear are in such a position generally that for them to lower second-hand values would spell loss, for, actually, plant that is now "second-hand" is very likely "third hand." The rise in the second-hand curve until July, 1924, was too rapid to be explained by industrial buying alone. Industry had then too lately got rid of the plant, and naturally did not re-buy. The appreciation, while affected by the small permanent demand, was largely due to buying and selling between dealers themselves. The majority of dealers who bought in the slump days have now got rid of the gear to other, and perhaps less fortunate, brethren, who cannot now afford to sell at anything like the prices ruling when they bought, and this is made the clearer if it be noted that the rate of absorption of second-hand plant is fairly proportional to the slope of the second-hand curve, at present sloping down very slowly. This means that the rate of absorption has passed zero mark and is now negative, which, in its turn, means practically that second-hand plant has had its day.

This is not surprising when, in addition to the foregoing, it is considered how much entirely special gear was in use prior to the slump. The rigorous demands of mass production resulted in a flood of machinery made solely for one or two purposes being supplied to industry generally. Naturally, in slack times, a general purpose machine takes the place of several of these highly-specialised machines, with the result that, when the sales took place, the latter were among the first to be thrown on the market. They are still there, and they are causing much trouble to both dealer and manufacturer alike. The dealer cannot get rid of them, and the result is that the maker is now engaged in rectifying second-hand plant that had been "faked" up to suit normal duties. No guarantee being available, the plant is peculiarly liable to all kinds of "touching up," as an example or two will show.

A batch of vertical motors was bought up by dealers who altered the machines by simply cutting off the stools and turning the motors on their sides. A few weeks later the original makers were inundated with complaints of bad bearings, bad everything. It transpired that no alteration had been made to the hollow bearing carrier or single thrust bearing. Instead of being mounted on the solid shaft and suitably clamped, the bearings were left loose. Naturally the fat was in the fire, and how much potential business has passed the makers as a result of the psychological effect of the trouble is hard to estimate. It must run into hundreds of pounds!

It is a common occurrence to come across a second-hand motor, originally designed for, say, 440 volts, 1,000 r.p.m., sold with only the fields paralleled to run at the same speed and power on 220 volts.

A machine, originally designed for 220 volts, had its interpoles removed and its field coils connected in parallel for 440-volt running. Similarly, some slip-ring machines were re-sold with the rings shorted, and "suitable for switching on the line." Perhaps the reason for this was that the motors had already been run minus the brushes on one ring, and that the starting resistances had been removed, likewise the time lags from the circuit-breaker. Again, odd squirrel-cage motors will be found mounted on channels with odd ram pumps, no provision being made for by-passing the pump at starting. One plant of this kind further had a link removed from the starter, so causing the motor to run on single phase. Certain motors, heavily compounded for driving flywheel-operated machinery, were actually used as battery-charging dynamos by cutting out the compound winding. Strange to say, trouble did not arise until field regulators were inserted!

These abnormalities could be amplified almost indefinitely, and they have had their effect. Buyers have had their "medicine." Hence they are slowly leaning over to new plant, provided that the price be suitable. The present difference of approximately ten per cent. is evidently sufficient to effectively counterbalance constructional and guarantee disadvantages, and, therefore, new plant is once more coming into its own. While new prices are still falling slightly the (to all intents and purposes) parallelism of the two curves shows certainly that the influence of second-hand plant is surely waning. The falling of the second-hand curve commenced 15 months ago, and the rate of fall is appreciably steady, a certain sign that second-hand gear is no longer exercising a potent attraction on buyers in general. Individual instances, of course, must still have their influence on the general situation, and it is probably these instances which have caused the slight fall in new prices, it being borne in mind also that not very long ago "ring" prices were cut rather considerably. (The curve does not represent ring prices). It is felt, however, that this is only a temporary phase, and that it is reasonable to expect, with the more complete sifting out of good and bad second-hand plant in process of time, that the curve of the new unit will again rise.

The process must, of necessity, be slow. Cost accountants know full well that at present industrial electric motor prices are of the order of 20-40 per cent. on net material alone, a state of affairs bordering too closely upon the dangerous to give cause for any satisfaction. Only the most modern methods of production can cope with this, and then only if the market exists.

Fortunately, from the decreasing effect of second-hand plant, it may be taken that the market, if not at present existing, is again in the process of gradual creation, and the near future may, therefore, be regarded with greater confidence than has hitherto prevailed.

Preserving Power Poles.—The power pole problem is causing considerable perturbation among Power Boards in New Zealand, and the increasing scarcity of native timber is making the problem a contest between foreign timber and home-grown makeshifts, with a possibility of the concrete pole slipping into first position as the result. Several Power Boards have experimented with home-grown foreign timber, imported poles, and native timber not hitherto proven satisfactory for pole purposes, and the results have not been very reassuring, inasmuch as many of the experimental poles rapidly deteriorate under weather pressure, resulting in bad breaks and some serious accidents and fatalities.

The Thames Valley Power Board, N.Z., has been experimenting with poles under similar conditions, and has instituted a further test of methods of preserving poles from weather effects. The first series of experiments were with State Forest Service poles erected in sandy soil in an exposed situation, and six different species of timber were included in the test. The experiments were conducted by Mr. N. G. McLeod, the Board's engineer, who tried some 13 different treatments. The first trees were treated with a special preservative mixture in two different strengths, either brushed on hot, or the poles dipped therein. Hot creosote, brushing or dipping; butt charred without other treatment; butt charred and creosote dipped; and butt charred and dipped in hot tar, were the other methods used. A complete check of the trees and their treatment has been recorded by the Board, while observations will be made from time to time to ascertain the results, and a valuable record for posterity should result.

Eve Essential.—At the sixth conference of the season of the North-Eastern Area Sub-Committee of the British Electrical Development Association, held on Wednesday, March 24th, at Newcastle-upon-Tyne, Miss Anna Holm spoke on "Women's Influence in Electrical Development."

Oil Engines in Parallel.

Test Results of Two Heavy-Oil Engines on Electrical Load.

It appears to be not generally realised to what extent success is met with in the running of oil engines in parallel on electrical loads, particularly in connection with 3-phase a.c. supplies. In this connection some culars of two 100-h.p. heavy-oil engines, made by the the Campbell Gas Engine Co., Ltd., which we recently saw under test, driving 3-phase alternators in parallel, together with an outline of the test results, may prove of interest. The engines were built to the order of the Crown Agents for the Government of Ceylon, where the

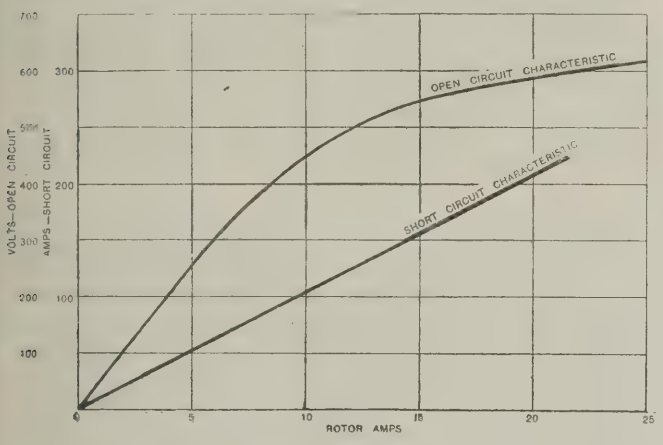

Fig. 1.—Alternator Characteristic Curves.

plant is to be installed with a view to its possible future running in parallel with hydro-electric plant. The engines are identical in every way, and are of the four-cylinder pattern. Each works on the four-stroke cycle, and the fuel is injected through a mechanical atomiser at the end of the compression stroke. Probably the most interesting feature of the engine, to which no doubt the successful results obtained are due to a large extent, is the governing system. Each cylinder is served by its own feed pump, and the stroke of this is varied by the governor through a system of cam and lever apparatus. The governor is of the ordinary spring-loaded centrifugal type, and varies during its operation the vertical position of a small roller mounted at the end of a suitable arm. This roller forms the fulcrum of a lever, one end of which is in contact with a projection of the feed-pump plunger, the other end being acted upon by a cam carried on a horizontal shaft which is worm-driven from the main crank shaft.

The engine is started from cold by means of compressed air without any preliminary heating, the necessary ignition commencing automatically. Starting valves are provided on two cylinders. The governor, which is fitted for hand control, is gear driven, and is designed to maintain constant speed within 5 per cent. for a momentary load variation from full to no load, and 3 per cent. for a permanent variation. The flywheel is of the heavy type, with a coefficient of speed fluctuation not exceeding 1/250. The cylinders are water-jacketed, being provided with removable liners. The inlet and exhaust valves are cam operated. Forced lubrication is provided to all the enclosed bearings, the pressure being produced by positively-operated ram pumps.

During the tests the engines were directly coupled to two 55-kW 50-cycle alternators, made by the Lancashire Dynamo & Motor Co., Ltd., and two 3.75-kW shunt-wound exciters of the same make. The engines were first run on a five-hour full-load test for steady running and fuel-consumption observations. During that period the maximum load variation on "A" engine was between 54 and 55.8 kW, and the average fuel consumption amounted to 0.654 lb. per kWh, or 0.420 lb. per b.h.p.h., the alternator efficiency being 86 per cent. The maximum load variation on "B" engine was between 54 and 55.44 kW; the fuel consumption was 0.708 lb. per kWh, or 0.459 lb. per b.h.p.h., with the same efficiency for the second electrical machine.

A two-hour overload test was next applied to the machines running in parallel, when a steady load of 68.4 kW was maintained on each machine. An extra overload was further put on the parallel engines, when each took 73.8 kW. Another test included the instantaneous throwing of the load of one machine to the other by breaking the circuit of the first alternator; this process was also reversed. The engines were further subjected in parallel to variations from full load to quarter load in about 20 seconds. The last three entirely successful operations were not included in the official tests, as laid down by the consulting engineers, but were undertaken at the request of ourselves to subject the machines to as severe a test as the facilities available would permit.

The official tests were carried out under the supervision of Messrs. Preece, Cardew & Rider, consulting engineers to the Crown Agents.

Reference to the characteristic curves of the alternators, fig. 1, will no doubt add to the interest of the above particulars. Fig. 2 shows one of the sets complete as it appeared on the test platform.

In conclusion, we are indebted to the Campbell Gas Engine Co., Ltd., for the facilities offered to us to see the engines under test and collect the above particulars, and to the Lancashire Dynamo and Motor Co., Ltd., for placing the characteristic curves of the generators at our disposal.

Motor Vehicles Parade.—In connection with the London and Home Counties Division of the Commercial Motor Users Association, the twentieth annual parade took place in Lincoln's Inn Fields on Saturday afternoon, the object being to encourage drivers to take a personal interest in the driving and the condition of their vehicles. About 200 vehicles had been entered, 144 being petrol driven, 24 steam, and 15 electrical. A feature of this year's show was the section for electric vehicles, of which there have never previously been more than half-a-dozen, but in view of the co-operation of the British Electrical Development Association, which, in addition to nominating two special judges, awarded a number of prizes for the best electric vehicles on parade, the number was likely to increase. Willesden District Council took first honours in the electric-vehicle section. Prior to the parade a large company was entertained to luncheon at the Savoy Hotel; Mr. W. McDowall occupied the chair, and Lt.-Col. J. T. C. Moore-Brabazon (Parliamentary Secretary, Ministry of Transport) was the principal guest.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Country-House Fires.

The facts regarding two of the recent but not serious country-house fires reported in the daily Press may be interesting to your readers.

The electrical installations were carried out in screwed steel conduit by my firm, and nothing electrical was to blame.

Both fires were definitely traced to old boiler flues, used for new boilers of about 10 times greater capacity than those in use up to five or six years ago. In one case, the fire broke out right up on the second floor, and in the other on the first floor. Something else might have been blamed if the cause could not have been traced fairly easily.

One fire was put out by means of pails of water and a local fire engine, but resulted in considerable damage, and the other was got under quickly by means of an electrically operated fire protection plant and a well-trained staff of servants.

Installation work in country houses where generating plant is employed is usually of better quality and workmanship than in town houses, the reason being that consumers, architects, and consultants select their contractors with greater care and price is not always placed before reputation.

The consumer will often, unfortunately, allow a chauffeur or semi-skilled engineer to make small extensions and alterations to existing wiring, and the fire risk in that work is sometimes serious. I have seen good jobs spoilt by these extensions, carried out carelessly on motor-car wiring lines.

H. T. Young,
Pp. Troughton & Young.

London, *March 22nd*, 1926.

"Yet more mansion fires caused by the fusing of electric wires."

The monotonous recurrence of the above statement in the daily Press calls for very serious consideration and explanations.

Electricity is now considered without a rival as an illuminant, and a very convenient vehicle for power for all purposes, and should be absolutely safe. But, unfortunately, it has become such a willing servant and *so* docile that any Dick, Tom or Harry considers himself an expert electrician and forthwith runs a pair of wires *via* a switch to a lamp, and forsooth the lamp lights!!

Granting that the first installation is put in by a reputable firm with conscientious men, they hardly turn their backs when another light is wanted somewhere, and the chauffeur or head gardener, or some other handyman undertakes the job, quite oblivious of any rules even of common sense, much less the I.E.E. rules.

Now if every insurance company were to employ a qualified electrical engineer to examine all installations occasionally, he, with his Megger, galvanometer, and battery could very soon detect the various little slips committed by the local tiro, and save the client the unfortunate loss of valuable things and sometimes lives that cannot be replaced, besides much good property.

If the engineer only saved one fire a year it would pay his salary many times over, and save much heart-burning and regrets. At the same time he could cast an inquiring eye on the fireplaces to see if the local jobber had concreted the hearth properly before putting in that beautiful modern well grate in the various entertaining rooms.

Now, even those insurance companies that have an engineering branch affiliated do not cause very careful tests to be made for insulation, continuity, and earthing of a lighting and heating installation. They concentrate on the moving machinery—prime movers, generators, motors, &c., leaving the vulnerable cables, fittings, &c., to chance.

I suggest that for the sake of the electrical trade, and insurance business, independent examination of all installations should be made compulsory.

J. Price.

Manchester, *March 25th*, 1926.

The Government Electricity Scheme.

I must protest against Mr. Hodges's diatribe in your last issue. I was comparing 1924 costs with 1924 charges according to Garcke, 1924-25, the latest figures available to one not connected with Mr. Hodges's company.

But since my last letter, both the draft Electricity Bill and the Weir Report have been issued, and I now feel that we can calm Mr. Hodges's fears. In all probability his bulk supply will cost him much less than 3d.; in any case, he will not be called upon to pay more for his electricity than his present total cost of generation. After reading the Weir Report, one feels inclined to say that Mr. Hodges's figure of 3d. per unit of bulk supply at his works is much too high.

These two facts, I feel, sufficiently answer Mr. Hodges. But I must protest against his drawing a red herring across the trail by comparing his purchase price with his lowest selling price; although in 1924 he was selling *some* electricity at 1½d. per unit, his average revenue (according to Garcke) was 7.39d. per unit: obviously offering a sprat to catch a mackerel, a policy which, according to his letter in your issue of February 26th, is "sheer folly and absolutely uneconomic"!

H. J. Allcock.

Manchester, *March 26th*, 1926.

[This correspondence is now closed.—Eds. Elec. Rev.]

Electrical Engineers' Data Books.

Referring to your review of the above books in your issue of March 26th, I understand from the publishers that the first few copies of the books were bound, for some reason (or lack of reason) unknown to me, with the indexes in front of the appendices. This was quickly rectified, but as copies for review are the first to be sent out, you apparently received one of the few with the index so misplaced.

With reference to the two-volume arrangement of the work and your statement that it would have been better to combine Vols. I and II, I should like to point out that Vols. I and II can also be purchased bound in one volume with one appendix, and in this way it may be obtained at the reduced price of 28s., instead of 15s. each volume.

D. V. Onslow, A.M.I.E.E.

London, *March 27th*, 1926.

The Qualifications of a Salesman.

I read with interest and amusement the advertised vacancy for a sales assistant, appearing in your columns to-day. It appears that applicants are particularly requested to state among other things, birthplace, college attended, &c. The point I wish to raise is this: Have a man's birthplace and the names of his colleges, as such, any bearing on his abilities as a sales assistant? Presumably the odds are in the applicant's favour if he were born, say, in Criccieth rather than in Wigan. The questions of vaccination, measles, &c., were omitted, doubtless reserved for the "personal interview."

Your advertiser runs a grave risk of overlooking the man who can *do* things, in favouring a man whose qualifications will probably extend no further than a high-sounding college name, and the possession of a three-valve wireless set!

Can British employers learn nothing from democratic America, where "efficiency" counts, and a man is given the opportunity to "prove" himself?

Qui Pense.

March 26th, 1926.

The Single-phase Earth Return System.

Owing to an appointment in the country I was prevented from attending the discussion on "Electro-farming" at the Institution of Electrical Engineers; I should have liked to refer to the single-phase earth return system, which is mentioned by Mr. Borlase Matthews in his reply, because I feel certain that until this system is permitted in this country, the cost of electricity for rural districts will be prohibitive.

I have only advocated this because I have seen what has been done in other parts of the world in rural districts by the adoption of this system. There are practically no uses of electricity in rural districts that absolutely necessitate the use of a 3-phase system. There seems to be still an unwarranted prejudice against the use of single-phase motors even for small powers. Surely, when, broadly speaking, single-phase earth returns can be adopted in crowded cities to drive railway trains, the interference with other electrical systems can be overcome. Universal three-phase is a craze, and people will not realise what single-phase can do.

I have not referred to the subject for some time because it seems like beating the air, and an ordinary person has not got the time for that. At the same time it is worth pointing out that in about half the cases I am interested in, we are able to buy electricity at reasonable rates, invariably on the three-phase system, and in the other half local generation has to be resorted to. I can unhesitatingly say that were single-phase earth returns permitted, in no single case would it be necessary to erect a local generating station.

A. Hugh Seabrook.

London, *March 26th*, 1926.

Printing Office Lighting.—An interesting and novel lighting scheme has recently been introduced into the *Daily Express* machine rooms. The printing presses are now illuminated by 100-W White Osram gasfilled lamps suspended around the machines, superseding the older method of installing lamps in difficult and inaccessible positions amid the machinery. The great vibration of the modern printing press demands the use of lamps which will stand up to the severest conditions, at the same time maintaining such an intensity of light as will enable any mechanical defects in the machinery to be instantly observed, and removed whilst the machines are running. An interesting sequel to this installation was afforded when a quantity of molten lead was spilt over one of the lamps; the latter was withdrawn by its flexible cord, with several pounds of lead adhering to it, and it remained lighted.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

"Nick-o-Time Tunometers."

The above-named products of the Tunometer Works (proprietors: M. & A. Elliott) are interesting in that they are claimed to be the only commercial type of "infinitely variable all-wire tuners available for adaptation to electromagnetic coupling, allowing high inductance to be obtained and reactive capacity tuners to be dispensed with on wavelengths below 600 metres. The sample aerial and reaction tuners and fixed inductance coils which we have received are excellently made and an important constructional feature may be noted: The plated 18-gauge bare copper coil is uniformly spaced as indicated in fig. 1, and a rotary contact wheel is employed to enable the wavelength desired to be accurately tuned without the aid of a condenser, giving fine adjustment, greatest inductance, and minimum capacity. The A-type coil itself, in conjunction with the average aerial, should tune to 368 m.; by removing the shorting plug and inserting the standard 35 to 50 coils, it should tune to 600 m., and for reception on 1,600 m. the tunometer may be shunted with a 0.0003 mfd. variable condenser, which, however, should be completely switched out of circuit when working in the B.B.C. wave band. It may be pointed out that although the wire appears to be embedded in the groove in its ebonite former, it is not so, as the wire makes contact with the former throughout the length of each spiral at only two points, which feature results in low distributed self capacity. The small losses, uniform coupling, and regular convolutions of the conductor make the use of only a small amount of reaction necessary, while the reduction of capacity which is possible by the use of these coils makes the use of a low-impedance detector valve desirable, similar to the B.T.-H. "B4."

The aerial "series vernier," fig. 2, is similar in construction, affording a means of fine final control. It is provided with a neat ebonite fixing bracket, which may be easily removed if one-hole attachment is preferred; the terminal of the outer convolution is preferably connected to the aerial side.

Plug-in type nox-variable inductance coils are also made in the same manner; as no two turns come into contact or cross each other throughout the length of the spiral, the condenser effect between turns is reduced greatly. The method of construction implies great mechanical strength, and such coils will not absorb moisture, being easily cleaned with a duster.

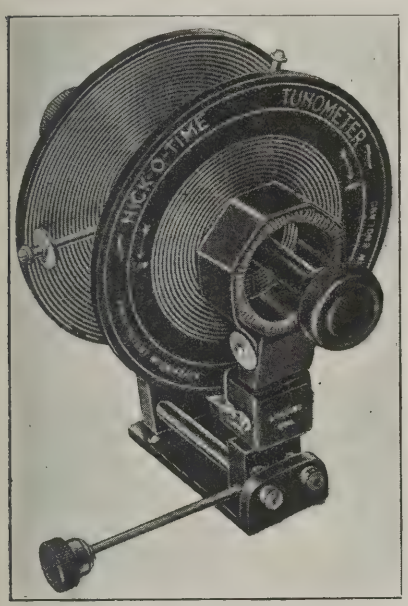

Fig. 1.—"Nick-o-Time" Reaction Tunometer.

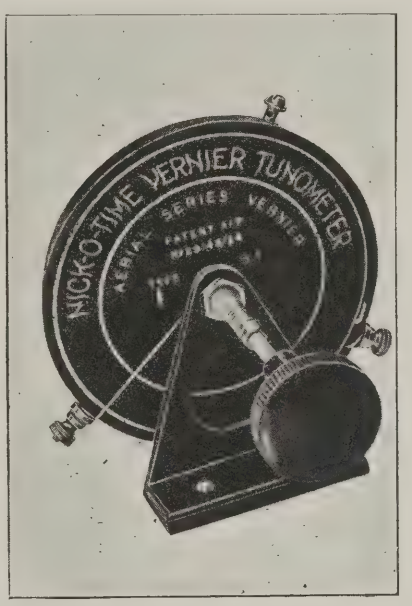

Fig. 2.—Aerial "Series Vernier."

A New Accumulator.

We are informed that the Hart Accumulator Co., Ltd., has recently placed a new low-pressure accumulator cell on the market for radio work. It is said to be specially made for use in conjunction with dull-emitter valves, and is known as the "Enduro." A strong glass box is used having internal ribs, between which the five plates are fitted, and a sealed glass lid is provided. The 2-volt cell has a capacity of 10 Ah (20-hour discharge rate) and weighs about 5 lb. with acid; it is 2¾ in. long, 4 in. wide, and 5⅞ in. high. When a larger cell is required the "Magno" type (25/50 Ah capacity) is available.

Apropos recent references to the radio-telephony of Mr. Derek Shannon, of Sutton Coldfield, who "succeeded in speaking . . . to a man in Mexico City . . .," we are informed that the results were secured with the aid of two 100-volt "RAO"-type Hart high-pressure batteries.

Loud-speakers.

Surprisingly good results are obtainable with home-made loud-speakers. The "Lissenola" attachment, in conjunction with a paper diaphragm, or horn, can be made to give good results, and experiments in this connection should be fruitful. Dr. Lee de Forest's latest invention is said to be the "Audalion," that utilises a paper cylinder which receives vibrations from a reed; it is claimed that the instrument radiates sound uniformly in all directions. Another new speaker is the invention of Dr. N. W. McLachlan, who recently demonstrated it in the course of a lecture before the Radio Society of Great Britain. It is of the cone type fitted with an external annular baffle to balance the upper and lower tones.

A Buoyant Valve-holder.

Designed to impart buoyancy to the valve and protect it from vibration, the holder illustrated in fig. 3, of which we have received samples from Messrs. Garnett, Whiteley and Co., Ltd., have given satisfaction in service. As is shown in fig. 3, the centre piece, which contains the phosphor-bronze valve-leg sockets, is free to move in all directions, stops being provided to protect the nickel-silver springs when inserting and removing the valve. The holder is made of genuine Bakelite, the leg sockets are recessed to prevent shorting, and the terminals stamped G, FF, A on both sides.

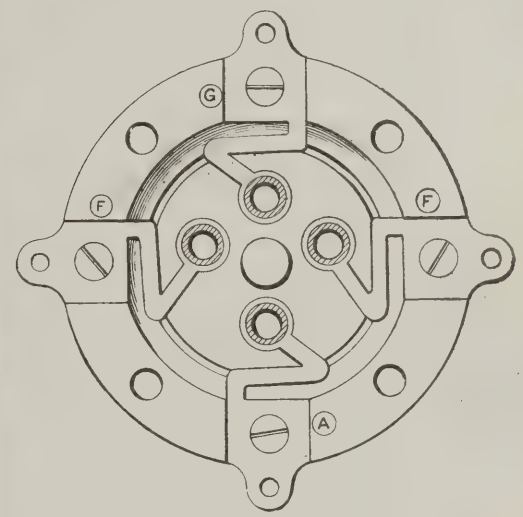

Fig. 3.—"Lotus" Valve-holder.

Variable Condensers.

The General Electric Co., Ltd., has added another unit to the range of "Gecophone" low-loss, slow-motion variable condensers. The original series were of 0.001, 0.0005, 0.0003, 0.00025, and 0.0002 mfd., and the new addition is 0.0001 mfd. They conform to the modern principle of one-hole fixing, and the large control knob with which each is fitted allows the setting to be altered to a very fine degree, the absence of cut gears giving smooth movement.

Novel Scissors and Knife.

A pair of scissors which should be useful to those who delight in assembling radio apparatus at home has been patented by Messrs. Christopher Johnson & Co., of Sheffield. The device should enable components to be mounted without the use of any other appliances, for it combines a universal spanner for round and hexagon nuts; bent shanks, which keep the fingers clear of the panel and enable nuts to be gripped in parts difficult of access; bevelled edge sharpened for cutting rubber insulation and scraping enamel or cotton covering off wire; strong scissors for cutting tape, &c.; wire cutter; a deep-cut file on the back for sawing and a finely-cut file on the side; and a screw driver. The scissors are 4½ in. long.

A somewhat similar tool, but in the form of a hand-made pocket knife, is marketed by Geo. Ibbertson & Co. This Sheffield product has a hand-forged steel blade, which is relieved of work it should not be made to do by the provision of a tool that serves as a screw driver. The flat under side and one of the bevels are file cut, while the other plain bevel is ground to an edge suitable for wire scraping and has a notch for the removal of insulation. At the opposite end to the blade is a pair of wire cutters.

Legal.

Theft of Electricity.

At the Eccles Police Court on March 22nd, Thomas Henry Willcocks, Eccles, was summoned for fraudulently abstracting electricity from the Corporation's mains. For the prosecution it was stated that the defendant's installation was supposed to consist of 80-W lamps, and he was charged on that basis. A Corporation inspector found that the defendant had substituted 100-W lamps and had tampered with a current limiter, putting it out of circuit. Defendant stated that he knew nothing at all about electricity. One night the lights went out, and he undid the seal of the limiter and fastened some wires inside.

A fine of 40s. was imposed.

British Thomson-Houston Co., Ltd., v. W. A. Tunstall, Ltd.

In the Chancery Division on March 23rd, before Mr. Justice Lawrence, Mr. Trevor Watson mentioned the motion against the defendants, trading as the Novelty Co., in which his Lordship had granted an *ex parte* injunction, restraining the defendants from infringing the plaintiffs' lamp patents.

Mr. Watson said that it was a case in which the defendant company, a limited company, was apparently trading under a name other than its own.

Counsel for the defendants said that there was an affidavit from the liquidator of the company, who was pendant to the action, and another by Mr. Wm. Alexander Tunstall. The affidavit of the liquidator explained that immediately the defendant company went into liquidation, the premises and business at 311, Gray's Inn Road, formerly belonging to the defendant company, were taken over by Mr. Tunstall in his own name and he had been trading as the Novelty Co. The defendant company was registered as the proprietary of the business carried on as the Novelty Co., and since it went into liquidation it had been the practice to strike out its name on the stationery. The affidavit of Mr. W. A. Tunstall stated that he formerly carried on business at Hornsey as the Novelty Co., a registered name. The defendant company was incorporated in February, 1922, and registered as the proprietary of the business carried on by the Novelty Co. When it went into liquidation he took over the premises, trading as the Novelty Co. in his own name.

Mr. Trevor Watson suggested that the writ should be amended by adding Mr. Tunstall as defendant.

His Lordship said that Mr. Tunstall was willing to give an undertaking.

Counsel for the defendants observed that they might take the writ as amended, and he would undertake to enter an appearance for Mr. Tunstall.

His Lordship instructed the defendants to give an undertaking not to sell or deal in the lamps until judgment or further order, costs to be costs in the cause.

Theft Charge.

At the Old Street Police Court on March 26th, Walter Fredk. Crispe, 31, traveller, of Mitcham, was charged, on remand, that being bailee of £6 15s. 9d., the moneys of John Eastwick, radio manufacturer, 118, Bunhill Row, E.C., he fraudulently converted it to his own use and benefit. Detective-sergt. Weir said defendant pleaded guilty when previously before the Court and there was a remand that there might be communication with respect to another case. He (the officer) had received a message to the effect that the trader in question did not want to proceed with it. Mr. Snell said that he would remand the defendant in custody for a further week. If he then heard a good report of defendant, he would let him go.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Strike Averted at Birmingham.—On March 23rd, the Salaries, Wages and Labour Committee of the Birmingham Corporation considered the application of electrical fitters in the Gas and Tramway Departments for the raising of their wages to the level of those paid to fitters in the Electric Supply Department. The Committee decided to accede to the demand, and the men accordingly withdrew the strike notice which they had given.

E.D.A. Activities.—A short time ago it was announced that the Electric Vehicle Committee of Great Britain had been reconstituted under the auspices of the British Electrical Development Association. We have now received from the latter body three illustrated pamphlets in which the advantages of the electric vehicle are put forward in an interesting way. Three applications of the vehicle are dealt with, *viz.*, for electricity supply undertakings, for refuse collection, and for delivery purposes. Emphasis is laid upon the lack of noise and odour, the ease of control, the economy and the cheapness of maintenance of the electric vehicle.

Overseas Orders for British Firms.—Among recent contracts secured by members of the British Engineers' Association are the following:—Messrs. W. H. Allen, Sons & Co., Ltd.—Pumping machinery for the main drainage of Cairo, including electrical plant; International Electrolytic Plant Co., Ltd.—Plant for the production of hydrogen and oxygen for France and America; Messrs. Petters, Ltd.—Engines for installations supplied by the British General Electric Co., Ltd., South Africa; the Anderson Grice Co., Ltd.—Four-motor electric locomotive cranes for New Zealand; Messrs. Bruce Peebles & Co., Ltd.—Two 7,500-kW alternators for the Lake Coleridge hydro-electric scheme, New Zealand; and Alloy Welding Processes, Ltd.—Three two-operator arc-welding machines for the Eastern Bengal Railway.

Wages in the Engineering Industry.—A conference was held in London on March 24th in connection with the application of the engineering trade unions in the London area for an increase of 2os. per week in the wages of their members. After a discussion lasting seven hours no agreement was arrived at, and the matter will now be referred to the central conference

Chinese Tariff Increases.—The Chinese authorities at Peking have put forward a list of proposed surtaxes on foreign imports ranging from 2½ to 27½ per cent. *ad valorem*. In Class E, in which goods are subject to a 7½ per cent. surtax, the following items appear:—Electric wires, cables, switches, roses, cleats, batteries, transformers, motors, and materials of all kinds not otherwise specified, except dynamos and motors (*sic*); and telegraph and telephone materials of all kinds. Class D, subject to 12½ per cent. surtax, includes electric lamps and lampware, shades, pendants, brackets; fans and accessories; electric cookers, toasters, radiators, irons and similar electrical appliances

Lead.—Messrs. James Forster & Co., reporting on March 27th, stated that the fresh fall in prices had put a check to any small improvement in demand, and consumers had practically withdrawn from the market. As little influential support was forthcoming, it seemed likely that the price would go to an even lower level until the restoration of confidence. "On the other hand, the position is not without some bright spots. There is a vast amount of buying to be done by consumers, particularly cable makers, few of whom have bought their supplies further than a few weeks ahead. Moreover, there is a better demand in Germany, and the lower prices in London will serve as a check to further selling of lead for forward delivery."

The American Radio Industry.—According to an American trade paper, quoted by the *Wireless Trader*, the radio industry of the United States is in a chaotic condition owing to over-production. One of the leading firms of radio manufacturers produced 300,000 multi-valve receiving sets during 1925 which remain unsold, and other firms find themselves in a similar position. As a result of this the prices of sets have been cut to ridiculous figures; multi-valve sets have been sold at as low as $10. In one liquidation it is estimated that the liabilities must have been well over a million dollars. The valve industry is also in difficulties through excessive production and there again the prices have fallen to very low levels in many instances. Our contemporary thinks that there may be an endeavour to unload a large amount of apparatus upon the British market.

Japanese Tariff Revision.—The import duties on certain plant and machinery will be increased if the new Japanese Tariff Bill is passed into law. Among the articles affected are boilers, gas and oil engines, water turbines and Pelton wheels, and dynamos and other electrical machinery.

Timber Trade Report.—Our Timber Trade Correspondent reports that the country is still well stocked with general construction woods from the North of Europe, and although the market is fairly firm, there is considerable competition for inquiries. In forward business the market has been dull of late. There is, however, sufficiency of timber to come forward, mainly of Finnish, Swedish, and Russian origin, so there need be no anxiety regarding spring and summer supplies. In the hardwood trade, mahogany logs are still a disappointing market so far as the poorer qualities are concerned, although there is a satisfactory call for the better varieties. Mahogany boards and planks are firm, as also are ebony and the choice woods, such as rosewood and satinwood. In American lumber, *i.e.*, ash, oak, walnut, satin-walnut, and other varieties, the high views of shippers for forward business are having the effect of keeping the United Kingdom market firm, notwithstanding large supplies in this country. The pole market is firming up a little, which should help holders of such stocks in this country.

Australian Electrical Industry.—An article in the *Sydney Daily Guardian* for February 12th quotes a number of statements from the presidential address delivered by Mr. G. A. Julius, B.Sc., to the Institution of Engineers at Hobart. After comparing Australian and American wages and giving other statistics, it is stated that to the Protectionist the figures seem to suggest that Australian manufacture needs tariff encouragement, to help it forward to the efficiency of the U.S.A.; but Mr. Julius argued a case against the imposition of tariffs to help smaller industries, and especially against electrical apparatus works. Setting out his case against duties on electrical apparatus, Mr. Julius claimed that the duty paid in 1923-24 was £859,000 to help 3,641 employés earning £174 each, and producing an "added value" of £243 each. The duty was about £236 an employé. Mr. Julius thought the taxation too high for the result. His argument is that these duties (1) have, by high prices, discouraged power equipment; and (2) have impeded the use of electric labour-saving devices. "The present method of extending assistance to electrical manufacturers through the tariff has failed," says Mr. Julius. His remedy is to take the tariff away altogether; not to increase it, in the hope of making electrical apparatus more efficiently in the Commonwealth.

For Sale.—Nottingham Corporation electricity department has for disposal 16 Lancashire boilers, 19 steam dynamos, 4 Weir feed pumps, 3 Berryman feed-water heaters, 2 Green's economisers, steam, exhaust, and feed-water pipes and valves. Hull Corporation Electricity Department has for disposal surplus generating plant. Sutton Coldfield electricity department has for sale one 150-kW steam balancer set, complete with control panels, &c. (See our advertisement pages to-day.)

Trade Announcements.—MESSRS. CARTER LEE & Co. have removed to larger premises at 42, Finsbury Square, London, E.C.2. A priced leaflet of their "Cyldon" variable condenser has been received.

MESSRS. LINDLEY, DUFFIELD & Co., LTD., of Brassington, Wirksworth, have removed their London office to 11, Aldwych, W.C.2. Telephone No.: "Gerrard 6753."

THE LIVERPOOL ELECTRIC CABLE Co., LTD., has opened a city office and stores at 63, Moorfields, Liverpool, where stocks of v.i.r. wires, cables, and flexibles are available, as well as at its works in Bootle. The telephone number of the new office is "Bank 5782."

MESSRS. JOHN RICHARDS & Co., LTD., electrical engineers, of Burton-on-Trent and London, have opened a branch business at 22, Bore Street, Lichfield.

MR. BEN CROSLAND (trading as Crosland & Bateson), electrical contractor and armature winder, Heckmondwike, has opened a new showroom at 85, Bradford Road, Batley.

YESLY ELECTRICAL SUPPLIES, LTD., of 5a, Iliffe Yard, Crampton Street, London, S.E.11, has been registered to continue the personal trade connection of its managing director, who was with Engineering Supplies, Ltd., and Shenton and Co. Catalogues are asked for.

MR. A. S. TONG, Newcastle branch manager of the Foster Engineering Co., Ltd., has taken over the firm's transformer business for the northern area, which, until recently, has been handled by Messrs. Lindsay & Ward.

MESSRS. FERNAND ESPIR have removed to 86 and 88, Queen Victoria Street, London, E.C.4. New telephone Nos.: "Central 2492 and 2493."

The METROPOLITAN RADIO COMPANY has opened a retail wireless store at Dominion Buildings, Drake Circus, Plymouth.

Messrs. ED. BENNIS & Co., LTD., announce that Mr. J. G. McLean is no longer their representative on the North-East Coast and Sheffield and district areas. They ask that until a new appointment is made communications shall be addressed to the head office, Little Hulton, Bolton.

Catalogues and Lists.—MR. PERCY PITMAN, 25, Victoria Street, London, S.W.1.—Leaflet describing a new hydraulic governor.

MESSRS. FREDERICK BRABY & Co., LTD., Glasgow.—A series of pamphlets dealing with various forms of steelwork—for buildings, barrows, staircases, &c.

THE IRON & NICKEL BATTERY Co., LTD., 17-19, Cockspur Street, Pall Mall, S.W.1.—A leaflet describing "Ionic" batteries for yacht lighting.

MESSRS. ROBERT MCGREGOR & Co., Alpine Steelworks, East Molesey.—A blue print illustrating twenty types of cable hangers and racks.

MESSRS. HOUGHTON-BUTCHER (GREAT BRITAIN), LTD., 88-89, High Holborn, W.C.1.—A series of pamphlets advertising the company's radio service.

THE CARPAX Co., LTD., 312, Deansgate, Manchester.—A priced and illustrated folder advertising "Homcharger" battery chargers.

METROPOLITAN-VICKERS ELECTRICAL Co., LTD., Trafford Park, Manchester.—"Service to the Textile Industry"—a brochure (1.874/1) dealing with steam and electric drives for textile works.

MR. E. J. BATY, 157, Dunstable Road, Luton.—A card advertising radio service and a number of devices.

BROOKHIRST SWITCHGEAR, LTD., Northgate Works, Chester.—Calendar cards for April, May and June, bearing illustrations of the company's control panels and starters.

MESSRS. GEORGE GREEN & Co., 40, Aybrook Street, Manchester Square, W.1.—An illustrated price list of electrical calorifiers, bath-water heaters, and storage geysers.

DIXONIA, LTD., 4, Portsmouth Street, Kingsway, W.C.2.—A priced and illustrated catalogue of automobile accessories.

MR. L. J. WOLF, 116, Putney Bridge Road, S.W.15.—A folder advertising Robbins & Myers fractional horse-power motors.

MESSRS. GENT & Co., LTD., Faraday Works, Leicester.—A well-illustrated and priced catalogue (Book 2) of telephones and accessories for offices, institutes, and factories.

Bankruptcy Proceedings.—W. S. MILES, "Roslyn," Worston Road, Burnham-on-Sea, Somerset, radio engineer.—The receiving order in this matter was made on March 12th on debtor's own petition. The statement of affairs shows liabilities of £761, against assets of £43, or a deficiency of £718. Debtor states that on June 8th, 1925, he commenced business at Lynton Road, Burnham-on-Sea, as a wireless instrument dealer with a capital of £50, but was only able to make a bare living. Debtor did not at any time take any steps to ascertain his financial position, but admits that he became aware of his position in 1923, when he gave a former partner a promissory note for £600.

First meeting, March 31st at the Official Receiver's office, 26, Baldwin Street, Bristol. Public examination, April 12th, at the County Court Offices, Bridgwater.

C. HUBBARD, electrician, 13, Magdalen Street, Norwich.—Receiving order made March 19th on debtor's own petition.

J. A. A. BARDSLEY, electrical contractor, 91, Old Hall Lane, Withington, Manchester.—First meeting March 30th at the Official Receiver's offices, Byrom Street, Manchester. Public examination April 30th, at the Court House, Manchester.

B. G. THOMPKINS, radio engineer, Armstrong's Buildings, Stanley, Durham. First meeting April 1st, at the Official Receiver's office, Pearl Buildings, 4, Northumberland Street, Newcastle-on-Tyne. Public examination April 15th, at the Court House, Newcastle-on-Tyne.

A. MCNEILL (A. McNeill & Co.), electrician, Oakfield Chambers, Motherwell.—The estates of the above debtor were sequestrated by the Sheriff of Lanarkshire on March 23rd. A meeting to elect the trustee and commissioners will be held on April 6th at County Buildings, Hamilton. Agent, Mr. J. K. Murray, solicitor, Motherwell.

J. C. HEALY, electrical engineer, 4, Worsley Terrace, Wigan.—Receiving order made March 26th on debtor's own petition.

M. D. ROSENBLOOM (D. Rose & Co.), electrical engineer, 25, Osborn Street, E.—Application for discharge to be heard April 20th at Carey Street, W.C.

R. HAWORTH, electrical engineer, 154, Duckworth Street, Darwen.—Last day for proofs for dividend April 9th. Trustee, Mr. H. Parker, Official Receiver, 11, Winckley Square, Preston.

Company Liquidations.—PRICE'S BATTERY AND RADIO Co., LTD., 11, Hart Street, New Oxford Street, W.—A meeting of creditors was held on March 23rd at the Charing Cross Hotel, W.C., when Miss E. Watts, who had been appointed to act as the liquidator in the voluntary liquidation, presided. The liquidator reported that the unsecured liabilities amounted to £5,258, and the assets, after deducting preferential claims, to £1,472, leaving a deficiency of £3,786. It was stated that the company was formed in 1924 to take over the business of Alexander Price & Co., which had been established for some twelve years. The company acquired the sole exclusive rights to use certain patents belonging to Mr. Price. The authorised capital of the company was £5,000, of which £3,001 had been issued. The company started trading as manufacturers of batteries, accumulators, &c., but after a time it was decided to expand the business by undertaking the manufacture of radio apparatus. The company did a fairly good trade for some six months, and it was decided to issue further shares, bringing the total issued capital up to £4,500. The present position of the company was attributed to heavy advertising and to expenses incurred in perfecting a patent condenser. For the purposes of the statement of affairs no value had been placed upon the patent in question. The company paid nothing for the patent, but agreed to pay a royalty of one penny on every condenser sold, and acquired the British rights. A balance sheet at June 30th, 1925, showed a balance on the profit and loss account of £1,747. At that time the stock stood in the books at £1,140. The goodwill was valued at £2,770, and trade creditors £1,300. There was also an ovedraft at the bank of £2,133, which had subsequently been paid off by Mr. Agar, who now claimed against the estate. A resolution was passed confirming the voluntary liquidation of the company, with Miss E. Watts as liquidator, and an advisory committee was appointed consisting of Mr. Haines, the representative of Messrs. V. C. Bond, and Mr. W. Baker, representing creditors. The following are creditors:—

	£		£
Haines, H. E.	278	Sun Electrical Co., Ltd. ...	24
Bond, V. C.	135	Lytton's Machine Tool Co. ...	25
Fuller's United Electric Works, Ltd.	125	Metropolitan Electric Supply Co., Ltd.	30
Olver, J. V.	57	Chloride Electrical Storage Co., Ltd.	22
Graham, A.	35	Agar, M. F.	3,385
Burton, B. C.	34	Stones, —.	76
Gardner & Sons, H.	32	Price, —.	427
Birk, F. W., & Co., Ltd. ...	41		
Iliffe & Sons	26		

DOMESTIC & GENERAL ELECTRICAL Co., LTD.—Winding up voluntarily. Liquidator, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C. Meeting of creditors April 7th, at the Liquidator's offices. Particulars of claims to the Liquidator by April 28th.

BRITISH WIRELESS SUPPLY Co. (1924), LTD.—Winding up voluntarily. Liquidator, Mr. G. S. Smith, 17, Piccadilly, Bradford. Meeting of creditors held March 31st, at Leeds.

Napier Kimber, Ltd.—A meeting of members is called for April 26th, at 24, Basinghall Street, E.C., to hear an account of the winding up from the Liquidator, Mr. S. H. Gillett.

P.S. Wireless Manufacturing Co., Ltd.—A meeting of members is called for April 28th, at 34, Grand Parade, Brighton, to hear an account of the winding up from the Liquidator, Mr. E. Webb.

Private Arrangements.—H. E. Leigh and R. W. Leigh, trading as Leigh Bros., 290a, St. Paul's Road, Highbury, N., manufacturers of radio apparatus.—A meeting of creditors was held on March 22nd, when the chair was taken by the representative of Mr. H. S. Wright, one of the largest creditors. The debtors presented a statement of affairs which disclosed liabilities of £783 and assets of £628, leaving a deficiency of £155. The debtors stated that they started trading in November, 1922, with a small capital. In 1923 the turnover was £5,682, and there was a net profit of £618. In the following year the turnover was £8,340, and the net profit of £637. In May, 1925, Mr. H. S. Wright, who made up a large proportion of the debtors' components, fell ill, and left the country. The debtors then took a workshop in St. Paul's Road and started to manufacture. After May, 1925, a slump occurred in the wireless trade, and the turnover fell considerably, and the debtors were unable to clear off certain liabilities. A resolution was passed agreeing to accept an offer of a composition of 6s. 8d. in the £, payable as to 5s. on April 1st and a further 1s. 8d. in the £ in three months, suitably guaranteed to the satisfaction of a committee of inspection consisting of Mr. E. Fleury, Mr. O'Callagan, and Mr. C. Latham, representing creditors.

Trade with Cuba.—A recent report by Mr. M. H. C. Kelham, Acting British Consul-General at Havana, upon economic conditions in Cuba (Stationery Office, 1s. net), states that although trade between Great Britain and Cuba has shown a steady increase during the past two years, British trade has probably suffered more than that of any other country from local depression. United States and German goods often obtain preference owing to the very low, and in some cases uncompetitive prices offered. There is still in Cuba a willingness to purchase from the United Kingdom, but in spite of this British firms are still encountering many difficulties through delays in delivery, heavier Customs duties, &c.

Reduced Polish Duties on Machinery.—The Minister of Finance has been authorised to make a reduction of 90 per cent. in the import duty on machinery and apparatus not manufactured in Poland and destined for the equipment of new industrial establishments. Since this large reduction is intended to facilitate the equipment of factories on the most modern lines, it will not apply to machinery of old patterns.—*Reuter's Trade Service* (Warsaw).

Proposed Swedish Tariff Reduction.—The Norwegian Government has under consideration a revision of the customs tariff and among the proposals is one that the duty on electric cables and insulators shall be reduced from 35 to 30 öre per kg.

New Electrical Firms.—The following new electrical businesses have recently been started:—

R. Herbert & Co. (radio manufacturers and wholesalers), Horley, Surrey.

The R.B. Sales Co. (radio engineers), London Terminal Aerodrome, Croydon, Surrey.

The Brecknock Wireless Stores (wireless trading), 177, York Road, N.7.

The Cleartron Northern Sales Co. (wireless valves and accessories), 66, Market Street, Manchester.

The Voltron Co. (merchants of wireless), 75, City Road, London, E.C.1.

The Key Manufacturing Co. (radio components and repetition work), 29, Old Compton Street, W.1.

M. Forbes & Dunlop (radio and electrical apparatus), Skaelkmuir Mill, Canon, Falkirk.

E. Lee & Son (cycle and radio engineers), 8, North Street, Gosport, Hants.

The Sulfeta Co. (accumulator acids), 11, Hopwood Gardens, Tunbridge Wells.

H. Page & Sons (electrical engineers and contractors), 70, Wool Exchange, Coleman Street, E.C.

Kimber & Son (electrical engineers), 81, Whitehorse Road, Croydon.

The West (Greenwich) Trading Co. (wireless trading), 78, South Street, Greenwich.

G. Gordon & Co. (electrical and mechanical engineers), 114, Alexandra Parade, Glasgow, E.

The Nelson Electric Co. (electrical engineers and contractors), 26, Bignor Street, Cheetham Hill, Manchester.

The Grange Electric Co. (sale of electrical accessories), Grange Street, Keighley.

The Wireless Repair Depot (repairing wireless accessories), 39, Bethlehem Street, Grimsby.

C. Lindop & Co. (electrical and mechanical engineers), 8, Lower Breck Road, Liverpool.

New Belgian Company.—A new company has lately been formed at Schaerbeek, Brussels, with a capital of 250,000 fr., and the title La Société Belge pour l'Equipement Electrique pour Véhicules.

New Municipal Showroom and Offices.—The showroom and offices of Blackburn Electricity Department in Queen Street, Great Harwood, were opened by Councillor A. Slater, J.P., chairman of the Council, on March 25th.

Chinese Notes.—A recent issue of the *Chinese Economic Bulletin* gave details of the three tramway systems working in Shanghai, those of the Shanghai Electric Construction Co., Ltd., the Cie. Française de Tramways et d'Eclairage Electriques de Changhai, and the Chinese Electric Power Co., Ltd. These three systems cover the main business and residential sections of the city, except the Chinese district of Chapei. Some months ago the Shanghai-Paoshan Tramway Co., Ltd., was organised by a number of Chinese to start a line in the densely-populated Chapei district.

A Shanghai correspondent reports that the Chapei Waterworks & Electricity Co., Ltd., has a bulk supply agreement with the Shanghai Municipal Electricity Department. This expires in 1930, and the company then proposes to install its own plant, consisting of two 4,000-kVA turbo-generators, together with the necessary boiler plant and switchgear. It is probable that long-term credit will be required for payment.

New Cable Company in Czecho-Slovakia.—The Krizik company of Prague, the Bratislava cable works, and the Kablo company, of Kladno, are forming a joint stock company for the manufacture of long-distance cables. The company will have a capital of 1,200,000 crowns.—*Reuter's Trade Service* (Prague).

Local Exhibition.—Bridlington.—The Council's electrical engineer (Mr. A. J. Beckett) informs us that as a result of a week's exhibition at Bridlington, nine of the leading electrical companies have sold 150 cookers and washers, apart from other appliances. Among the concerns which exhibited and demonstrated apparatus were Metro-Vick Supplies, Ltd., the General

Electrical Exhibition at Bridlington.

Electric Co., Ltd., the Edison Swan Electric Co., Ltd., the Jackson Electric Stove Co., Ltd., the Cable Accessories Co., Ltd., Siemens and English Electric Lamp Co., Ltd., Messrs. Moorwoods Ltd., the Credenda Conduits Co., Ltd., and the Hurley Machine Co. The stands of some of these firms are shown in the accompanying illustration.

Threatened Tramway Strike.—At the end of last week the employés of the Rochdale Corporation tramways gave notice of their intention to cease work to-day (Friday) on account of the dismissal of two men for misconduct.

Social Events.—The social clubs of W. T. Henley's Telegraph Works Co., Ltd., and Henley's Tyre & Rubber Co., Ltd., held their annual dinner at the Florence Restaurant, W., on March 20th. Mr. P. Rosling presided in the absence, through illness, of Mr. W. J. Potter. Sir George Sutton sent a telegram regretting his inability to attend. The speeches were brief and witty, and an excellent concert was provided by two members of the staff (Messrs. H. Stanley and J. N. Tinniswood) and a number of professional entertainers.

A dinner was given to their staff by Messrs. E. J. Strange and Sons, Tunbridge Wells, on March 19th, to celebrate the firm's centenary, it having been established in 1824. The firm organised an electrical branch (now Strange & Sons Electrical Engineering Co., Ltd.) twenty-five years ago. We have received a souvenir booklet prepared for the occasion of the centenary.

The third annual staff dinner of the Automatic Telephone Manufacturing Co., Ltd., was held on March 19th, at the Exchange Hotel, Liverpool. Sir Alexander Roger, chairman of the company, presided over an assembly numbering about 150, representative of all sections of the company's Liverpool and London personnel. The toast of the evening, "The Company," was proposed by Mr. W. P. Horsburgh, F.R.I.B.A. In responding, the chairman referred at some length to the progress of the undertaking, its growth and varied interests. He paid tribute to the untiring efforts of the staff. It was announced that the manager of the company, Mr. G. W. Moore, had been appointed to the board of the International Automatic Telephone Co., Ltd. An excellent musical programme was furnished under the direction of Mr. Wilfred Bird, L.R.A.M.

The staff of the Siemens concerns held a dance at Slater's, Oxford Street, W.1, on March 26th. About 200 people attended.

Australian Tariff Decision.—Among the recent decisions of the Australian Customs Board is the following:—Coal-cutting machines: Free under the British preferential tariff; 5 per cent. under the intermediate tariff; and 10 per cent. under the general tariff.

Indian Electrical Imports.—The *Board of Trade Journal* for March 25th contained a review of India's import trade during the first nine months of the current fiscal year (April-December, 1925). This shows that Great Britain maintained her lead as the principal supplier of electrical machinery. The total value of imports under this heading was 146¾ lakhs of rupees, as compared with 139 lakhs in the corresponding period of 1924.

Book Notices.—The *Decimal Educator* for March (price 6d.) reports the progress towards complete reform in weights and measures which is being made by the countries which have most recently adopted the metric system, and gives many instances of the disadvantages to this country which are incurred by its adherence to out-of-date systems. It also gives extracts from an American publication showing the steps which are being taken by that country towards the adoption of the metric system.

"The Colliery Year Book and Coal Trades Directory, 1926." Pp. 100+1,024. London: The Louis Cassier Co., Ltd. Price £1 1s. net.—The fourth edition of this work contains a complete list of all the colliery owners of Great Britain, shows the number of men employed at each colliery, and gives particulars such as the constitution of the companies, their boards of directors, &c. Over a hundred pages of the book are devoted to statistics covering every phase of coal production and distribution, and a table shows the analysed costs of distribution in London and the provinces. The publication also contains a "Who's Who" of the leading men in the industry.

The Spring List published by Sir Isaac Pitman & Sons, Ltd., includes the titles of books on electrical engineering and technology, economics, chemistry, physics, and many other subjects.

"Science Abstracts" (A and B). Vol. XXIX, Part 3. March 25th, 1926. London: E. & F. N. Spon, Ltd. Price 3s. each.

"Commission Internationale de L'Eclairage—sixième session." London: Cambridge University Press. Price 15s. net.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLV. March, 1926. No. 3. New York: The Institute. Price $1.

New Australian Company.—Measurement (Australia), Ltd., was recently registered in Sydney, with a capital of £25,000, to acquire the Australian branch of Measurement, Ltd., and to carry on the business of manufacturers of meters for measuring the flow of water and other liquids and electricity.

Elma Illumination Design Course.—At the conclusion of the eighth illumination design course held in London at the Lighting Service Bureau, from March 23rd to 26th, which was attended by many representatives of electricity supply authorities, the "students" were entertained to dinner at Carr's Restaurant by Elma. In the unavoidable absence of Mr. C. H. Cox, Mr. C. W. Sully, director of Elma, occupied the chair, and expressed the regret of the staff that Mr. W. E. Bush was prevented by illness from taking part in the course. Referring to the questions at issue between some supply authorities and some electrical contractors, he urged that they should work together in harmonious co-operation. Mr. E. W. Jones said they were all agreed that the course had been both instructive and thoroughly enjoyable, and expressed their deep appreciation of the kindly treatment they had received. Mr. A. L. Johnson, proposing the health of the staff, said they had all given of their best, and Mr. Horner (Leatherhead) cordially endorsed his eulogy. Mr. W. J. Jones responded, thanking all for the kind spirit that had prevailed throughout the course. Mr. L. E. Buckell asked for suggestions from salesmen in particular for the improvement of the course for their benefit, and remarked on the extraordinary enthusiasm of the students. Amongst other speakers, Mr. Holmes (chairman of the Sales Committee of Elma) said he was impressed by the close attention given to the lectures, Mr. Hughes (Glasgow), and Mr. Evans (Newcastle) testified to the excellent results they had obtained by popular lectures at many provincial towns, and Mr. Sully, paying a tribute to the organiser of the course, Mr. R. C. Hawkins, said that the Bureau was willing to assist undertakings to open bureaux in the provinces, to be maintained by those locally interested in the industry. An excellent entertainment was provided and was thoroughly enjoyed.

The German Electrical Industry.—The report of the Siemens-Schuckert Works Company states that the revival in the home market which was mentioned in the report for 1923-24, continued until almost the end of 1924-25. The invoiced turnover in 1924-25 was materially higher than in the previous year, which in turn surpassed the turnover of the last pre-war year, considered in volume; measured in prices, it was about one-third higher than the latter. It was necessary to increase by over 30 per cent. the number of workers as compared with 1913 in order to deal with the increased turnover. Thanks to the far-reaching foreign organisation, it was possible for the company to secure a good share of foreign orders. The German iron and steel industry was very reserved in the allocation of orders, but business with public supply undertakings was more active. Special reference is made to the securing of the contract for the harnessing of the Shannon.

The report of the Siemens & Halske Company, dealing with the year ended with last September, states that the amount of the net profits is considered unsatisfactory seeing that the works were abundantly occupied during the whole of the year. Further work was carried out in the direction of reducing the number of types of manufactures and the development of mass production. The advantages resulting from these methods operated for the most part during the whole of the year, but they were insufficient to counterbalance the effect of the increased burdens and the large advances in wages and salaries. The business received was abundant, so that the orders in hand at the commencement of the new financial year showed an increase. Particular activity was manifested in the telephone branch for the extension and improvement of existing installations, but the prices realised in various branches were insufficient, especially for foreign orders owing to increased duties and the preference given to native manufactures. Down to the end of the year business in telephone cables was also satisfactory. The company has participated in the development of broadcasting with the Telefunken Company. There was again a scarcity of orders in the railway signalling branch. After referring to the extension of interests in the department of medical electricity, the report states that business in electric furnaces again improved, that the Vienna works were well employed and that a branch factory has been established in Milan.

Great German Steel Trust.—The shareholders of five leading German steel-producing companies are being asked to approve an amalgamation of their interests in the Vereinigte Stahlwerke A.G. The new trust's capital will amount to 800 million marks (£40,000,000), and the companies participating and the amount of their holdings are as follows:—The Rhein-Elbe Union, 39.5 per cent.; Thyssen, 26 per cent.; the Phœnix, 23.65 per cent.; the Rheinstahl, 8.5 per cent.; and the Van der Zypen, 2.35 per cent. The bulk of the capital of the last concern is held by the Phœnix company.

Electrical Machinery for Argentina.—Our correspondent in Buenos Aires says that extensions and re-equipment of the new port are proceeding and offer a favourable opportunity for British manufacturers. A number of steam and hydraulic cranes are being converted, and the machinery already, or to be supplied includes movable electric cranes, fixed cranes, and electric wall cranes. The port is provided with an electric generating plant. There is also scope in the provinces for the introduction of electrical plant and machinery in sugar factories. Many of the sugar manufacturers would give favourable consideration to any proposal for substituting electricity for steam or hydraulic power in the larger mills. Already, where electrical power has been introduced, the production efficiency has been greatly increased. In one case the introduction of electric plant was effected nearly twelve years ago. A 260-kVA vertical steam-engine driven generator furnishes the power, which is used to operate some fourteen enclosed motors varying in size from 10 to 15 h.p.

The Industrial Alliance.—By 70,695 votes to 31,423 the Amalgamated Engineering Union has decided to join the proposed "Industrial Alliance," which now embraces seven trade unions, with a membership of over 1,600,000, including the Electrical Trades Union. These unions have agreed to render assistance to one another in industrial disputes. The form which the assistance will take ranges from help in negotiations, through financial support, to complete "sympathetic" action.

Unemployment.—The figures relating to unemployment for the week ended March 15th showed that the decrease is still continuing. The total at that date was 1,070,800, as compared with about 1,094,000 a week earlier. The reduction during the preceding twelve months was 148,400.

Lighting and Power Notes.

Bexhill.—Loan Sanctioned.—The Electricity Committee has obtained sanction to a loan of £6,500 for feeders and distributing mains.

Brighton.—Electricity in Bulk.—The Electricity Committee has arranged terms with the promoters of the Hassocks and Hurstpierpoint electricity supply scheme with regard to the terms upon which a bulk supply might be furnished to the company from the Preston Park sub-station. To afford this bulk supply it will be necessary to extend the e.h.p. feeder from Preston Park sub-station to a point in or near Patcham, where a suitable position for housing the switchgear for interconnecting and metering the supply can be arranged for. The cost of the mains is estimated at £4,850.

Canada. — Water-Power Resources.—The Dominion Water-Power Branch of the Department of the Interior at Ottawa has issued a review of the water-power resources of Canada, dated January 1st, 1926, in which it is stated that the known available water power in Canada, from all sources, is 18,255,000 h.p. for conditions of ordinary minimum flow, and 32,076,000 h.p. ordinarily available for six months of the year. A study of the uses to which the water-power installation is put shows that the 4,290,428 h.p. at present installed throughout the Dominion is apportioned to the following uses:

—3,466,422 h.p. in central stations for general distribution for domestic, municipal, and commercial lighting and power purposes; 481,971 h.p. in 116 pulp and paper mills (in addition, pulp and paper mills purchase about 275,000 h.p. from central stations, making a total of nearly 757,000 h.p. used in the manufacture of pulp and paper); 342,035 h.p. installed in industries other than central stations and pulp and paper mills. The total installation for the Dominion averages 465 h.p. per 1,000 of population, a figure which places Canada among the leading countries of the world in *per capita* utilisation of water power. The capital invested in water-power developments is estimated to amount to $815,723,890.

Electrical Development.—The Canada Northern Power Co. has decided to commence work on a transmission line from the Des Quinze plant to Rouyn, Quebec. Not only will the new line assure about 10,000 h.p., but the power site at Des Quinze lends itself to a big increase in power development at any time such construction is required.

Cheadle and Gatley.—Electricity Charges.—The Urban District Council has fixed the charge for electricity for heating, cooking, and domestic appliances to ordinary consumers at 1½d. per kWh during the summer quarters, and 2d. per kWh during the winter quarters.

Chirk.—Electricity in Small Houses.—The Rural District Council has appointed a special sub-committee to interview the Chirk Electricity Supply Co., Ltd., in connection with a proposal to install electric lighting in the Council houses at Rhosywaen.

Continental.—Belgium.—A new 10,000-kW turbo-alternator has recently been added to the power station at the collieries of the Société des Charbonnages de Marcinelle-Nord, bringing the capacity of the plant up to 15,500 kW.

The report of the Société de l'Electricité de l'Escaut of Antwerp for 1925 shows that during the past year the number of consumers increased from 19,081 to 24,087. Delays have occurred in connection with the erection of the 50,000-V transmission line between Merxem and Beerse to supply the northern and eastern sections of the province of Antwerp, but good progress is now being made, and it is expected that the line will be completed within a few weeks. Good progress has also been made with the electrification of the province of Limburg, in which there is now a distribution system supplying electricity to 191 communes. It is stated that there are now only 15 villages in the province without an electricity supply.

France.—La Société Lyonnaise des Eaux et de l'Eclairage has recently secured a concession for the supply of electricity in the Department of the Aube, Marne and Côte d'Or from its steam-operated station at Troyes and from hydro-electric stations at Beaulieu, Juvanze-sur-l'Aube, Autricourt, and Barberey-sur-la Seine.

Switzerland.—The Federal Council has authorised the drawing up of a report of all the hydro-electric stations in the country, the report to be ready by the end of April. At the same time, the Council has requested each canton to furnish a detailed annual statement concerning all the power-houses in its area, their annual yield, their use, &c. The object of these steps is to enable the country to be in a position to furnish every particular that may be asked for at the forthcoming International Exhibition of Hydraulic Forces to be opened at Bâle at the beginning of July, to put the Government in possession of the exact amount of h.p. and kW available for exportation after the country has been duly supplied with "white coal," and to put before the Federal authorities the surveyors' reports of every station with a view to their proper superintendence and taxing.

Coventry.—New Power Station.—The Electricity Committee is applying for consent to proceed with the first section of the new generating station at Longford, at an estimated cost of £559,000.

Ferryhill.—Electricity Supply.—The Cleveland and Durham Electric Power, Ltd., has under consideration a scheme for lighting the district, and proposes to canvass the business community and residents with a view to ascertaining the probable demand for electric lighting.

Gellygaer.—Loan.—The Urban District Council has applied for sanction to a loan of £5,115 for electricity purposes.

High Peak District (Derbyshire).—Electricity Supply.—Various proposals to provide the district with electricity have been advanced. The Power Development Co. has applied for an Order to enable it to sell electricity in the rural districts of Chapel-en-le-Frith and Disley, the urban district of Whalley Bridge, and the parish of Taxal. The electricity is to be purchased from Stockport Corporation and supplied to consumers from a sub-station at New Mills. The New Mills Council has applied for an Order to sell electricity in its own area, the energy to be purchased from Stockport, and distributed from a sub-station to be erected at New Mills. There would thus be two sub-stations taking electricity from one authority, but distributing it in separate areas. A conference of all the Councils concerned has been called to discuss the question of forming a joint board to undertake the supply of electricity to the whole area, the supply being taken from the Stockport Corporation.

Hornsey.—Electricity Extensions.—The Electricity Committee is to carry out the following extensions:—New l.p. feeder from the generating station to Crouch End Broadway, £3,000; extension of l.p. feeder in Stapleton Hall Road, £600; extension of l.p. feeder in Florence Road, £1,500.

Ilford.—Loans.—The Electricity Committee is to apply for sanction to the borrowing of £20,000 for mains and £20,000 for wiring installations.

Japan.—Electrical Development.—The Ina Douki K.K. has amalgamated with the Chuo Denka Koguo K.K., and has increased its capital from 15,000,000 yen to 20,000,000 yen. Application has been made to the Government for permission to erect a power station on the Koshibu River, where the Chuo company held a concession.

Kirkham.—Electricity in Bulk.—The Urban District Council has asked Preston Electricity Committee if it is prepared to give a bulk supply of electricity by tapping the proposed transmission line between Preston and Blackpool. The matter is being considered by a joint committee.

Lanarkshire.—Hospital Supply.—The Upper Ward District Committee of the County Council has arranged with the Clyde Valley Electrical Power Co. to supply electricity to the Roadmeetings Hospital for power and lighting at a flat rate of 2¼d. per kWh, the Committee meeting the first cost of the cable and transformer house, estimated at £2,200.

London.—Battersea.—The Electricity Committee has recommended alterations and additions to the condensing water system at the generating station at a cost of £29,500.

Luton.—Loan Sanctioned.—The Electricity Committee has received sanction to the borrowing of £10,500 for mains and switchgear.

Padiham.—Electricity Supply.—At a meeting of the Urban District Council, on March 25th, a resolution, passed recently, that the Council should operate its own electricity Order was referred back. It was decided to prepare plans for a transformer station.

Palestine. — Electrical Development. — Power stations operated by fuel-oil engines have recently been completed at Haifa and Tiberias.

Plymouth.—Electricity Supply.—The Corporation Electricity Committee is applying for sanction to the borrowing of £75,000 for mains and services estimated to be required during the next three years. Cable extensions at a total estimated cost of £2,094 have been sanctioned. The Committee has accepted a tender at £29,000 for the supply of a new 7,500-kW turbo-alternator.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Edinburgh.—Lighting: From 3¼d. to 3½d. per kWh.

Heston and Isleworth.—Power, heating, and cooking: From 2½d. to 2d. per kWh.

Launceston.—*Launceston and District Electric Supply Co., Ltd.*—Power: From 5d. to 4½d. per kWh. Heating: From 3d. to 2½d. per kWh.

Long Eaton.—Lighting: From 6½d. to 6d. per kWh. Power: From 2½d. to 2d. per kWh, with further reductions in the charges for heating and cooking and meter rentals.

Shipley.—Electricity in Bulk.—At a recent meeting of the Electricity Committee a letter was read from the Yorkshire Electric Power Co. with regard to the supply of electricity in bulk from the company's system. The Committee gave instructions for details of the proposals both for a partial and complete supply to be obtained and a full report prepared for consideration at a special meeting of the Committee to be arranged to consider this matter.

Silsden.—Inauguration of Supply.—The *Keighley News* reports that electricity was introduced at Silsden recently, a public supply for power purposes being provided from the mains of the Yorkshire Electric Power Co. The Company recently extended its mains from Ilkley to Addingham, and from Addingham they have been extended to Eastburn, at which point a connection is made with the Keighley-Skipton line. The Electricity Commissioners are still considering the competing applications for distributing powers deposited by the Keighley Corporation and Electrical Distribution of Yorkshire, Ltd.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The County of London Electric Supply Co. Ltd., for the supply of electricity in the urban district o Epping and certain parishes in the rural district of Epping the Newcastle-upon-Tyne Electric Supply Co., Ltd., in th urban districts of Prudhoe and Rothbury, and parts of th rural districts of Hexham, Alnwick, and Rothbury; the Cleve land and Durham County Electric Power Co., within part of the rural districts of Darlington, Hartlepool, Sedgefield and Stockton.

St. Austell.—Electricity Supply.—In connection with th St. Austell Electric Lighting & Power Co.'s scheme for th erection of a power station at Pontswill, it is proposed to ru h.p. cables from the station to St. Austell and Fowey, wit subsidiary cables to districts *en route* where required.

Sunningwell.—INQUIRY DECISION.—As the outcome of an application to the Ministry of Transport, who recently held an inquiry, the Abingdon Electric Supply Co. has received consent to the erection of h.p. lines over property at the foot of Bayworth Hill for the transmission of electricity.

Thornton-le-Fylde.—ELECTRICITY CHARGES.—The scale of charges for electricity has been fixed at 7d. per kWh for the first 250 kWh, down to 5d. for over 1,000 kWh for lighting purposes; and for power, 3d. per kWh for the first 250 kWh down to 2d. for over 1,000 kWh.

Wigan.—NEW ELECTRICITY CHARGE.—The Town Council, in order to encourage the more general adoption of electricity for domestic purposes, has fixed the following alternative scale of charges for private houses:—An annual charge according to the rateable value of premises, plus ½d. per kWh for electricity consumed. The adoption of the new scale is contingent upon the installation of domestic appliances, other than lamps, in accordance with the following scale of rateable values:—Houses not exceeding £25 per annum, 2 kW minimum to be installed; from £25 to £40, 3 kW; exceeding £40, 4 kW.

Willesden.—LOAN SANCTIONED.—The Electricity Committee has received sanction to a loan of £25,000 for mains and services.

York.—ELECTRICITY EXTENSIONS.—The following items are included in the next year's estimates of the Corporation Electricity Committee:—One 6,000-kW generating set, £20,000; cables and services, £10,000; Linton hydro-electric station, £7,000; boiler and engine house, £7,000.

Tramway and Railway Notes.

Continental.—GERMANY.—The Frankfurt correspondent of *The Times* reports that negotiations for a loan of 46,200,000 marks by the State of Baden have recently been concluded. The money is to be used for financing and extending State enterprises, including the electricity supply station. Part of the loan will be used for the purpose of acquiring a share in a large Rhine power works, which is important in connection with the plans for the electrification of the railways in Baden.

FRANCE.—*Electric 'Buses.*—At a recent meeting of the French Union de Voies Ferrées et des Transports Automobiles in Lyons, M. Chalumeau, chief engineer of that city, gave some particulars of the electric 'bus service run by the municipal authorities. Sixteen single-deck vehicles are in use, the chassis being of the De Dion type, the electrical equipment, comprising two 12-15-h.p. series-excited motors for each 'bus, having been supplied by the Tognini-Balbo Co., of Milan, Italy. The battery of Tudor-Hensemberger accumulators weighs from 2.3 to 2.5 tons, and the 'buses in running order (that is, with battery) weigh from 7.15 to 7.35 tons. The motors are directly connected with the rear wheels, the speed of the vehicles being entirely electrically controlled by means of a controller which gives five forward and two reverse speeds. Each 'bus covers a daily distance of about 56 miles, M. Chalumeau pointing out that this does not represent the full capacity of a single charge of the battery, but is a convenient running distance from the drivers' point of view. He added that trials are about to be made with the introduction of reduction gear between the motors and the road wheels; while this will probably slightly reduce the mechanical efficiency, it is expected to be more than counterbalanced by the gain in electrical efficiency.

Halifax.—NEW TRAMWAY CENTRE.—The sanction of the Ministry of Transport has been received to the scheme for the construction of a tramway centre at Bull Green, and the Tramways Committee has decided to proceed with the work.

Japan.—NEW ELECTRIC RAILWAYS.—The Tokyo Gryen Totsudo Koyo K.K. has recently applied for a charter to the Government. It is intended to construct a main electric railway line from Haneda, Tokyo-fu to Setagaya, through Omori and Magome and several branch lines on the outskirts of Tokyo. It is understood that an application for a charter has been made recently to the Railway Minister by the promoters of the Sanshin Railway. The proposed railway will be constructed in the Nagano Prefecture, and have a total length of 44 miles.

London.—"UNDERGROUND" IMPROVEMENTS.—The scheme of duplicating the tracks of the District Railway between Hammersmith and Acton Town, and the running over them of the trains of the Piccadilly Tube, as outlined by Lord Ashfield at the recent general meeting of the Underground companies, presages an important addition to the programme of Underground improvements. In addition to the extension of the Piccadilly Tube trains to Ealing and Hounslow, a general speeding-up of the western services of the District Railway will be afforded, and the additional tracks will enable a large number of Ealing and Hounslow trains to be worked on the non-stop principle between Acton and Hammersmith. The extension of the Piccadilly Tube services will provide Turnham Green, Chiswick, Acton, Ealing, and the Hounslow line stations with direct communication with Knightsbridge, Piccadilly Circus, Holborn, King's Cross, and other important centres. Between Ravenscourt Park and Turnham Green the District trains run over the lines of the Southern Railway, which here comprises four tracks, two of which—over which the old South-Western service to Waterloo, *via* Addison Road, was operated—have been virtually out of use since the war. The work entailed on this section consists in the electrification of the latter tracks and a rearrangement of the four tracks generally. It is expected that the new works will occupy about two years to complete throughout.

METROPOLITAN RAILWAY COMPANY'S BILL.—*The Times* states that the Select Committee of the House of Commons, presided over by Mr. Hopkins, heard further evidence on March 24th in support of the Bill promoted by the Metropolitan Railway Company for two short relief and facilitating railways, approximately between Edgware Road and Kilburn Priory. The estimated cost was stated to be £2,048,255.

Manchester.—PROPOSED UNDERGROUND RAILWAY.—In connection with the proposed tube for the city, the *Manchester Guardian* reports that at a meeting of the Underground Railway Committee, Mr. H. Mattinson, the tramway general manager, proposed that, instead of the scheme embracing the whole of the suburbs of Manchester, underground electric railways should be constructed between the various railway stations in the city. This would mean seven miles of underground railways, and the cost of excavation, &c., on the basis of the figures submitted for the original scheme, would be about £2,250,000. The Committee did not come to any decision, and will meet again to discuss the proposal. It was suggested that the scheme should only be taken up when the railways were electrified. Another suggestion was that there should be "through" services of electric trains between station and station, so that it might be possible to maintain services at the various stations to proceed directly underground. It was also proposed that the Corporation should construct underground railways, and that they should be leased to the railway companies.

Middlesbrough.—TRANSPORT SYSTEM REPORT.—The Corporation has adopted a recommendation, submitted by the tramway manager, Mr. H. G. Jeken, that the present tramway system in the borough be retained. In a report to the Committee, the manager stated that 20 railless cars would be required for the Linthorpe section of the tramway system to replace the present service, and the cost would be £31,000. The cost of alterations to the overhead line would amount to £4,000, and in addition there would be the cost of removing the present rails.

Middlesex.—TRAMWAY LEASE.—According to the *Tramway and Railway World*, the Middlesex County Council at a recent meeting passed a resolution requesting the Highways Committee to explore the possible alternatives to granting a new lease to the Metropolitan Electric Tramways, Ltd.

OMNIBUS COMPETITION.—The London United Tramways has informed the Twickenham Urban District Council that unless something definite is done by the Ministry of Transport to relieve the company of competition on certain routes which are flooded with omnibuses, it will be quite impossible for it to give any definite undertaking in connection with the reconstruction of the tramway in London Road, Twickenham.

Telegraph and Telephone Notes.

Czecho-Slovakia.—AUTOMATIC TELEPHONY.—A new automatic telephone system was put into operation in Prague in December, 1925. As it was impossible to complete connections for the whole city at once, the business sections were the first to be supplied, says *Commerce Reports*. Each of these sections has 4,000 connections and one central office. The remaining 8,000 connections are to be automatised during 1926.

Hungary.—INTERNATIONAL TELEPHONY.—With the view of linking Hungary with the international telephonic system, the Hungarian Post Office has concluded negotiations with the Austrian postal authorities. It has been decided to lay a new cable between Budapest and Vienna, which will be completed towards the middle of 1927. At the same time, cables between Vienna and Passau and Passau and Nuremberg are to be laid, so that the laying of the Budapest-Vienna cable means connection with the French, Belgian, Dutch, and Scandinavian systems. Among other neighbouring States with which negotiations are in progress is Czecho-Slovakia, and negotiations will shortly be initiated with Jugo-Slavia.—*Reuter's Trade Service* (Budapest).

India.—TELEPHONE DEVELOPMENT.—The Calcutta correspondent of the *Daily Telegraph* reports that remarkable strides in long-distance telephony have been accomplished in India during the past year, and the line between Delhi and Calcutta will be opened on April 1st. With the completion of the connection between Calcutta and the new capital the Posts and Telegraphs Department will have carried out practically the entire project which was taken in hand three years ago. There only remains the 1,250-mile line between Calcutta and Bombay, on which work is proceeding. The cost has been enormous, and even optimistic experts now doubt the financial results. The scale of charges has not yet been decided,

but the rate between Calcutta and Delhi is likely to be five rupees (6s. 8d.) for three minutes,, and between Calcutta and Bombay probably fifteen rupees (£1).

Jugo-Slavia. — Telephone Development. — The Jugo-Slav Postal and Telegraph Ministry is considering the carrying out of a plan for laying telephone cables to bring Jugo-Slavia into direct communication with foreign parts. According to the plan, two cables are to be laid from Avala, one to Hungary, *via* Novi Sad Subotica, and the other to Austria and Italy, *via* Zagreb and Laibach.—*Reuter's Trade Service* (Belgrade).

The Telephone Service.—The first automatic telephone apparatus in Preston was inaugurated on March 15th.

The Ipswich automatic telephone exchange was formally inaugurated by Sir John Ganzoni, M.P., on March 20th.

The Times reports that the Postmaster-General, Sir William Mitchell-Thomson, speaking at Redcar on March 23rd, said there were now 114,000 more telephone subscribers than in 1924, representing an advance of 9¼ per cent. The increase was as great in the rural as in the urban areas, 214 new rural telephone exchanges having been opened during the past 12 months. The calls registered exceeded 995,000,000.

Radio Notes.

Czecho-Slovakia.—Progress.—In spite of the rather slow beginning of broadcasting in Czecho-Slovakia, that country's electro-technical industry is very favourably situated, and so offers a solid basis for progress in wireless. At present the the industry is employed especially in the manufacture of spare parts, with which it supplies a very large number of customers. Nevertheless, several works have also begun to manufacture good receiving sets, which they are producing at advantageous prices. A system of relays has yet to be organised between Prague, Brno, and Bratislava, so that each of the three towns may broadcast the theatrical performances and concerts given by the other two.—*Reuter's Trade Service* (Prague).

Ecuador.—New Broadcasting Stations.—The Government of Ecuador has granted the request of a firm in Guayaquil to act for five years as exclusive importers of radio-telephone apparatus. The concessionaires undertake to erect two broadcasting stations, one at Guayaquil and the other at Quito, and to divide equally all profits accruing from the radio business between the Government and itself.—*Reuter's Trade Service* (Quito).

Iraq.—Import of Radio Apparatus.—The ban on the importation of radio equipment into Iraq has been lifted. Purchasers of radio sets must register with the Director of Posts and Telegraphs, however, and obtain a permit before a set may be used. Iraq has no broadcasting station, and reception is very unsatisfactory during eight or nine months of the year, says *Commerce Reports*, which indicates that it is not likely that a profitable market will develop in the near future.

New Radio Circuit.—The daily Press reports that Sir Oliver Lodge has designed a new circuit which will ensure perfect reception without aerial tuning, and will thus avoid the use of reaction. Sir Oliver, in a statement to the Press, said that the reports were entirely premature, but that he expected to be in a position to make an announcement on the subject in about a month's time.

Radio Exhibition at Birmingham.—A Birmingham and Midland Wireless Exhibition is to be held in Bingley Hall, Birmingham, from May 19th to 29th. It is being promoted jointly by the Birmingham Chamber of Commerce and the British Industries Fair (Birmingham Committee). Members of the National Association of Radio Manufacturers and Traders are to participate, and so, it is hoped, will members of other trade organisations.

Russia.—Moscow Station.—The name Popoff has been given to the new broadcasting station at Sokolonika, Moscow, in memory of the deceased Russian scientist, Prof. Popoff.

Wave-length Adjustment. — Geneva Conference. — The International Council of Wireless Experts commenced another conference at Geneva on March 22nd, at which 20 countries were represented. According to *The Times*, it has approved the fundamental principles of a new plan for the allotment of wavelengths in Europe. The detailed plan will be further examined in each country and then submitted to the approval of the Governments. The plan divides wireless stations into two classes, those having a right to exclusive wavelengths and those having a low power which are employing a common wavelength. The waves will have to be measured according to a wave-metre common to all countries and each station will be requested to keep strictly to the wavelength it has been awarded. The plan does not deal with wave-lengths under 200 metres. Three technical committees have been appointed to examine means of clearing up the interests of European wireless organisations in international problems concerning wireless matters.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Argentina.—Buenos Aires.—Department of Sanitary Works. May 26th. Two 1,000-kW Diesel-engine generating sets.*

May 27th. Electrically-driven centrifugal sewage pumps.*

Australia.—Brisbane.—August 27th. City Electric Light Co., Ltd. One 12,500-kW turbo-alternator and two water-tube boilers, with economisers, draught plant, &c. Specifications (£5 5s.) from the offices of the company, Boundary Street, Brisbane.

Melbourne.—May 11th. P.M.G.'s Department. Telephone jacks.*

June 16th. City Council. Turbo-alternator, exciter, and condensing plant.*

Barking.—April 20th. County of London Electric Supply Co., Ltd. Circulating-water pumps and pump-house equipment, circulating-water screening plant, and boiler-house and coal-handling plant. (March 19th.)

May 11th. Switchgear and accessories, transformers and piping equipment. March 26th.)

Barnes.—Electricity Department. E.h.p. and l.p. cables. (March 19th.)

Basingstoke.—April 6th. Electricity Department. One 600-b.h.p. heavy-oil engine and direct-coupled dynamo. (March 19th.)

Belfast.—April 17th. Electricity Department. Automatic rotary converters with transformers, h.p. and l.p. switchgear and automatic control gear. (March 26th.)

Bolton-upon-Dearne.—April 22nd. Dearne District Electricity Board. Electric cables and accessories. (See this issue.)

Chesterfield. — April 10th. Electricity Department. 9,000 tons steam slack and 7,000 tons good, clean coke breeze required during 12 months ending May 31st, 1927. Form of tender, &c., from Mr. D. H. Davies, borough electrical engineer, Electricity Works.

Chile.—Santiago.—August 20th. Chilean State Railways. Signals, telegraphs and telephones, electrical material for sub-stations, aerial lines, and lighting.*

Colwyn Bay and Colwyn.—April 8th. Electricity Department. Stores for 12 months, including cables, joint boxes, cut-outs, house-service meters, &c. (March 19th.)

Dover.—April 14th. Electricity Department. 6,250 yd. e.h.p. cable. (March 26th.)

Dundee.—April 20th. Education Authority. Electric lighting at new central Advanced School at Blackness Road. Schedules from Messrs. Maclaren, Soutar & Salmond, architects, 16, South Tay Street, Dundee.

Edinburgh.—April 12th. Electricity Department. Four water-tube boilers, economisers, and mechanical stokers or alternatively, boilers, economisers, air heaters, and mechanical stokers, or boilers, economisers, and powdered fuel plant. (March 12th.)

Egypt.—Cairo.—April 27th. Egyptian Government. 1,100 desk telephones. Chief Inspecting Engineer, Queen Anne's Chambers, Broadway, Westminster, S.W.1.

Ferry Fryston (Yorks.).—April 20th. West Riding County Council. Electric lighting installation at Ferry Fryston, Airedale, new school. Specifications from Education Department, County Hall, Wakefield.

Hazel Grove, near Stockport.—April 13th. Hazel Grove and Bramhall U.D.C. 2,300 yd. armoured cable. (March 19th.)

Halifax.—April 12th. Town Council. Wiring for electric lighting of 80 houses, Booth Lane and Nursery Lane. Particulars from Mr. P. Saunders, town clerk, Town Hall.

Hull.—Telephones Committee. Supply and installation of automatic telephone exchanges. (See this issue.)

India.—April 19th. India Store Department. Goods lift for the Imperial Record Offices at Raisina, Delhi. (A.X. 2,904.)*

April 23rd. Electrical equipment for 15 motor coaches and 42 trailer coaches. (March 5th.)

April 30th. 22,000-V cables. (See this issue.)

May 7th. 15 motor-coach underframes and bodies, 30 motor bogie trucks. (March 12th.)

May 14th. Three 5-kW oil engine-driven generator sets, one switchboard, and two pumping sets.*

Irvine (Ayrshire).—April 12th. Town Council. Electric lighting installation at 25 blocks, consisting of 100 houses. Plans from Mr. Robert Frew, architect, 3, High Street, Irvine.

Leyton.—April 9th. Education Committee. Installation of electric lighting and central heating at the Sybourn Street new school. (March 12th.)

London.—Hammersmith.—April 14th. Electricity Department. H.p. insulated cables, air-cooled and oil-cooled transformers, and h.p. sub-station switchgear. (See this issue.)

Manchester. — April 6th. Electricity Department. 3-phase, 6,600-V sub-station switchgear. (March 12th.)

3-phase, 33,000-V switchgear, 3-phase, 6,600-V switchgear, neutral earthing resistances, and trip circuit batteries. (March 26th.)

April 13th. Tramways Committee. Copper, silicum, and cadmium bronze trolley wire. Forms of tender from Mr. H. Mattinson, general manager, 55, Piccadilly.

Middlesbrough.—April 16th. Electricity Department. Six or 12 months' supply of cables and 12 months' supply of meters. (March 26th.)

New Zealand.—June 21st. Auckland Electric Power Board. L.p. insulators, &c.*

WELLINGTON.—May 12th. Post and Telegraph Department. 18 switchboards.*

Perth.—April 12th. Electricity Department. One water-tube boiler, capacity 27,000 lb. per hour. (See this issue.)

Rawtenstall.—April 7th. Haslingden Board of Guardians. Wiring for electric lighting of new nurses' home, Rawtenstall. Form of tender, &c., from Mr. A. N. Rothwell, clerk to Guardians, Union Offices, Rawtenstall.

Salford.—Education Committee. Electric lighting installation at extensions of the Broughton High School for Girls. Specifications from Mr. R. S. Martin, Secretary of Education, Education Offices, Chapel Street.

South Africa.—JOHANNESBURG.—May 6th. S.A. Railways and Harbours. Two electric goods lifts.*

Southend-on-Sea.—April 19th. Electricity Department. 1,450 current limiters. (See this issue.)

Stoke-on-Trent.—April 13th. Electricity Department. 12 months' supply of mains and cables, a.c. and d.c. meters, sub-station switchgear, and static transformers. (March 26th.)

April 12th. Gas Committee. Electrical and other machinery, gas engine and dynamo. Contract No. 35. Particulars (20s.) from the Chief Gas Engineer, Gas Works, Etruria, Stoke-on-Trent.

Walthamstow.—April 13th. Electricity Department. Steel overhead bunkers and boiler-house buildings; and coal- and ash-conveying plant. (March 12th.)

West Ham.—April 8th. Board of Guardians. Two 100-V d.c. motors, with slide rails, two starting panels, &c. (March 26th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia. — COMMONWEALTH POSTMASTER-GENERAL. — Accepted :—

Counter e.m.f. cell batteries (£811), Automatic Telephones, Ltd.; accumulator and counter e.m.f. batteries (£1,813), Tudor Accumulator Co., Ltd. *Tenders.*

Barking Town.—Electricity Committee. Accepted:—

Switchgear.—New Switchgear Construction Co., Ltd. (£386); Edison Swan Electric Co., Ltd. (£321).

Brighton.—Lighting Committee.

Supply of a storage battery for Southwick power station :—

Tudor Accumulator Co., Ltd. (Accepted.)	**£6,959**
Alternative	7,016
D.P. Battery Co., Ltd.	6,893
Chloride Electrical Storage Co., Ltd.	6,960
Pritchett & Gold & E.P.S. Co., Ltd.	7,041

Standard testing set (£523).—Ferranti, Ltd. (Accepted.)
Motor-alternator set (£385).—J. H. Holmes & Co. (Accepted.)

Tramways Committee. Accepted :—

Points and crossings (£831).—Hadfields, Ltd.
Trolley wire (£80).—F. Smith & Co., Ltd.
Brake blocks (£108).—Hamworthy Engineering Co.

Cardiff.—The *South Wales Daily News* reports that the Electricity Committee last week reconsidered the recommendation which had been referred back relating to the supply of electrical cables for which a Belgian tender at £8,818 was recommended for acceptance, as compared with £10,869, the lowest British quotation. During the discussion it was stated that the lowest British tender had now been reduced by 6 per cent. (£673) so as to keep the contract in this country. Upon the question being put to the vote the Committee reversed its previous decision and accepted the tender of Pirelli-General Cable Works, Ltd., at £10,196.

Coventry.—The City Council has accepted the lowest British tender for cable in connection with its big electricity scheme, rejecting German offers which were 12½ per cent. lower in price.

Dundee.—The Corporation Electricity Committee has recommended acceptance of a German tender for cables. It was stated that on a total of £1,052, the German offer was £206, or 20 per cent., less than the British offers.

Hornsey.—Electricity Committee. Recommended:—

Troughs, covers and bridges for 12 months.—Doulton & Co., Ltd.
Lead service shells and house fuse boxes for 12 months.—Henry Hughes and Sons, Ltd.
H.p. switchgear for 3,000-kW set (£600).—A. Reyrolle & Co., Ltd.

Hull.—According to the *Yorkshire Post*, the Corporation Telephones Committee considered a large number of tenders for cable at its meeting last week, the members being equally divided as to whether the lowest British or the lowest German tender should be accepted. For leading-in wire the German price (Dennis & Co.) was £62, against the British price (W. T. Glover & Co., Ltd.) of £91. For inside wire the Magna Wire Cable Co. (German) quoted £151, and W. T. Glover & Co., Ltd., £187. For lead-covered cable the Power and Lighting Cable Co. (German) quoted £207, and the Union Cable Co. (British) £315. German insulators were quoted at £105, and British at £161. As the voting was equal in all cases, the City Council will have to decide which offers shall be accepted.

Electricity Committee.

Air preheater (£2,500).—Howdens, Ltd. (Recommended.)

Motor connectors.—	A	B
British Thomson-Houston Co., Ltd.	£2,671	£4,668
Bruce Peebles & Co., Ltd. (Accepted.)	**2,533**	**4,278**
Brush Electrical Engineering Co., Ltd.	1,685	3,150
English Electric Co., Ltd.	2,589	3,840
General Electric Co., Ltd.	2,589	4,490
Metropolitan-Vickers Electrical Co., Ltd.	2,590	3,841

Ilford.—The Electricity Committee has reconsidered its recommendation that the tender of the Ateliers de Constructions Electriques de Charleroi at £3,000 for a 1,000-kW La Cour converter, with necessary switchgear, be accepted, and in resubmitting the report, points out that the proposed new converter is a replica of the existing one in the Uphall Road sub-station, and that the provision of the additional machine was contemplated when the original 1,000-kW La Cour motor converter was purchased by the Council.

Electricity Committee.

Feed-water heater (£110).—Worthington-Simpson, Ltd. (Recommended.)
Switchgear (£266).—General Electric Co., Ltd. (Recommended.)
440 yd. .06 sq. in. cable (£173).—Macintosh Cable Co., Ltd. (Accepted.)
440 yd. 0.1 sq. in. cable (£244).—W. T. Henley's Telegraph Works Co., Ltd. (Accepted.)

Tramways Committee. Accepted :—

1 mile of trolley wire (9¾d. per lb.).—Frederick Smith & Co., Ltd.

Lamp Contracts.—The Metropolitan Water Board has placed contracts for 12 months' supply of electric lamps with the General Electric Co., Ltd., and Siemens and English Electric Lamp Co., Ltd.

Leeds.—Electricity Committee. Accepted :—

Cable.—£1,841, Enfield Cable Works, Ltd.; £4,719, Hackbridge Cable Co., Ltd.; and £2,056, Macintosh Cable Co., Ltd.
Cable troughing and covers (£2,905).—Middleton Estate & Colliery Co., Ltd.

Leicester.—Electricity Committee. Erection of two concrete water-cooling towers at power station :—

Mitchell Conveyor & Transporter Co. (Recommended.)	**£22,200**
Premier Cooler & Engineering Co., Ltd.	28,500

Switchgear in connection with electrification of sewage pumping plant (£570).—New Switchgear Construction Co., Ltd. (Accepted.)

London.—LONDON COUNTY COUNCIL.—Highways Committee.

H.p. switchgear for Lewisham sub-station :—

General Electric Co., Ltd. (Accepted.)	**£1,555**
A. Reyrolle & Co., Ltd.	2,138
Bertram Thomas	2,138
British Thomson-Houston Co., Ltd.	2,448
Ferguson, Pailin, Ltd.	2,608
Switchgear & Cowans, Ltd.	2,668
Johnson & Phillips, Ltd.	2,689
Metropolitan-Vickers Electrical Co., Ltd.	2,702
New Switchgear Construction Co., Ltd.	2,766
Whipp & Bourne, Ltd.	2,811
Park Royal Engineering Co., Ltd.	2,820

Education Committee. Recommended :—

Electric service lift at Wandsworth Technical Institute :—

Medway's Safety Lift Co., Ltd.	£238
Holt & Willetts. (Recommended.)	**255**
The Hoisting Appliance Co.	297
Waygood-Otis, Ltd.	378
A. Morgan	425

HACKNEY.—Electricity Committee. Recommended :—

Switchgear for the Millfields Road power house (£12,595).—A. Reyrolle and Co., Ltd.

AIR MINISTRY.—Accepted :—

Inert cells.—Edison Swan Electric Co., Ltd.

Northampton.—Board of Guardians. Accepted:—

Installing electric light at the Institution (£449).—E. Goldston, Ltd.

Retford.—Town Council. Accepted:—

Underground mains (£9,275).—Pirelli-General Cable Works, Ltd.
Transformers and control gear (£2,516).—Foster Engineering Co., Ltd.
Consumers' meters.—Measurement, Ltd.

Stirling.—Town Council. Accepted:—

Electrical work at the new tuberculosis dispensary.—Robert Blyth & Co.

Forthcoming Events.

Edinburgh Electrical Society.—Wednesday, April 7th. At the Royal Scottish Society of Arts, 117, George Street. At 8 p.m. Paper on "The Electrical Equipment of a Battleship," by Mr. G. Peers.

National Association of Supervising Electricians.—Thursday, April 8th. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 7.15 p.m. Paper on "Electrical Heating and Hot-Water Supply for Buildings," by Mr. W. W. Nobbs.

Institution of Electrical Engineers.—Thursday, April 8th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Papers on "The Application of Machinery at the Coal Face," by Mr. S. Mavor; on "The Design of Storage-Battery Locomotives for Use in Mines," by Mr. L. Miller; and on "Electricity in Mines: A Short Survey," by Mr. R. Nelson.

(North-Western Students' Section).—Tuesday, April 6th. At Milton Hall, Deansgate, Manchester. At 7.30 p.m. Annual general meeting.

Diesel Engine Users' Association.—Friday, April 9th. At Caxton Hall, Westminster, S.W. Paper on "Industrial Tests on Internal-Combustion Engines," by Mr. W. A. Tookey.

Electrical Power Engineers' Association (Southern Division).—Friday, April 9th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 7 p.m. Lecture on "Boiler Power Plant Developments in Association with Powdered Fuel," by Mr. F. H. Rosencrantz.

Notes.

Civil Service Commission.—Forthcoming examinations for male assistant superintendent of traffic (Class II) in the London Telephone Service and male assistant traffic superintendent in the provinces (18-23); the latest date for the receipt of application forms is June 2nd. Regulations, particulars, &c., can be obtained from the Secretary, Civil Service Commission, Burlington Gardens, W.1. (See our advertisement pages to-day.)

The St. Helens Inauguration.—At the opening ceremony of the extensions to the St. Helens generating station, described elsewhere in this issue, on March 23rd, the Mayor of St. Helens, Alderman T. Hamblett, briefly traced the history and development of the undertaking since its establishment 30 years ago. To-day the plant capacity of the station was 11,800 kW. At a subsequent luncheon at the Town Hall, Councillor F. Wilson, chairman of the Liverpool Electricity Committee, spoke of the enormous electrical progress made during the last few years in South West Lancashire. For years there had been cries of "reduce manufacturing costs," and there was no doubt that to a considerable extent that would be achieved by the generous use of electrical energy.

Alderman Foster referred to the low production costs of the St. Helens undertaking, which few authorities could equal.

Alderman Sir Peter Peacock, chairman of the Warrington Electricity Committee, congratulated the St. Helens Corporation on the progress of its undertaking. Warrington envied St. Helens as being the place that had the lowest production cost of any town in the country.

Mr. F. N. Rendell Baker, Borough Electrical Engineer, replying to complimentary speeches, said that the St. Helens scheme could be greatly developed as and when required. It was regrettable that St. Helens did not possess an electricity showroom, and at an early meeting of the committee he proposed making a recommendation that a first-class showroom should be provided. He hoped that the municipalities in South-West Lancashire would be brought together, so that co-ordination could be considered for a widespread development of the demand.

Mr. W. Johnstone, of the Brush Electrical Engineering Co., Ltd., responded to the toast "The Contractors," and his remarks were supplemented by Mr. W. Bayliss, of Messrs. Babcock & Wilcox, Ltd., who presented Councillor Hewitt, as chairman of the Electricity Committee, with a silver salver on behalf of the contractors.

Local Society.—The Edinburgh Electrical Society on March 20th, paid a visit to Port Edgar, and inspected various works, the Instruction Theatre, the torpedo works, and one of the light cruisers. Following on this visit a lecture will be given on April 7th, on the "Electrical Equipment of a Battleship," by Mr. G. Peers.

Late Legal.—Edison Swan Electric Co. (Branches), Ltd.—Mr. Justice Russell, in the Chancery Division on March 30th, granted the petition of the Edison Swan Electric Co. (Branches), Ltd., for power to extend the objects of the company as allowed by its memorandum of association, and to enable it to carry on its business not only in India, but in any part of the world. Counsel, in support of the petition, said the object of it was to enable the company to carry on an extensive agency business all over the world.

Appointment Vacant.—Junior electrician (£150), for the Cardiff City Mental Hospital. (See this issue.)

National Association of Supervising Electricians.—On Saturday last this Association held its annual dinner and musical evening at the Holborn Restaurant, London; the president, Mr. A. M. Sillar, M.Inst.C.E., occupied the chair, and there was a large attendance of members and guests. After the toast of "The King" had been duly honoured, Mr. A. H. Dykes, M.Inst.C.E., past-president, proposed "The Visitors," remarking on the acuteness of the organising committee in inviting prominent engineers to become acquainted with the Association.

Mr. W. Reavell, president I.Mech.E., responded, recommending electrical engineers to give attention to the mechanical design of their apparatus, as, in his experience, it was generally the mechanical parts that gave trouble. The supervising technician, he said, was the backbone of the electrical industry. Every man engaged in industry should be concerned primarily with service to his fellow men, and secondarily with his own interests; no permanent structure could be raised on a foundation of selfishness. Sir William Noble, M.I.E.E., also responded, recalling the days when he himself belonged to a similar but secret association of supervisers in the Post Office, which at that time was a somewhat risky matter. It was now recognised to be in the interests of both workers and employers that such associations should be formed.

Mr. R. A. Chattock, president I.E.E., proposed "The Association," remarking that many years ago he was instrumental in forming an association of power engineers working on similar lines; the educational activities of such societies were admirable, but still more valuable was the idea of helping one another in time of need. The Association was growing stronger every year, and he wished it every success. The electrical industry was largely dependent on men such as their members, who were doing splendid work. The Government Bill was put forward to stimulate the use of electricity and cheapen it, but the details of the Bill were not satisfactory; it would establish a bureaucracy, which might be amenable to political influence, and the cost of standardising frequency needed thorough investigation before any drastic step was taken. The necessity of standard frequency might disappear, in which case millions of pounds would have been wasted. It seemed likely that even without the Bill, in eight or ten years they would reach the consumption aimed at by the Government.

Mr. A. M. Sillar responded, expressing pleasure at the presence of the presidents of two of the leading engineering Institutions, and recalling the time when he was supervising electrician installing electric light in the Covent Garden Theatre in the 'eighties.

Mr. R. W. Whitley proposed "The Electrical Press" in complimentary terms, and Mr. A. H. Allen, M.I.E.E., responded, remarking that the Press had never had anything but praise to say of the Association. Mr. Lathom proposed the health of the Dinner Committee, and Mr. A. Brammer, general secretary, in reply, said that the maintenance of a high standard of qualifications for membership had paid the Association well; last year the membership increased by 22 per cent. and the funds by 45 per cent.

An excellent musical programme enhanced the enjoyment of the function.

Fatality.—At Dumbarton last week an inquiry was held into a recent accident at the Old Kilpatrick sub-station of the Clyde Valley Electric Power Co., whereby a man lost his life by coming in contact with a live wire. Evidence was given that the deceased and another man were in the building on the day of the accident for the purpose of cleaning 11,000-V cubicles. The man in charge of the sub-station said that although the switch and one set of links were opened, that did not completely shut off the power. The remaining set of links should have been drawn. When the accident happened he heard a report and saw a flame inside the cubicle. In a second the whole place was on fire. At first he did not realise anyone had been injured, and he went outside, but hearing a noise he returned and saw deceased hanging on the cubicle door. His foot had come into contact with a live wire. Replying to the Inspector of Factories, witness explained that when he returned to the chamber after the explosion and helped to free deceased the conductors were still alive in the cubicle. An engineer of the company, referring to the possibility of insulating the wire with which deceased came in contact, said it was not practicable because insulation put on a conductor in that particular position would become highly charged. The jury returned a formal verdict.

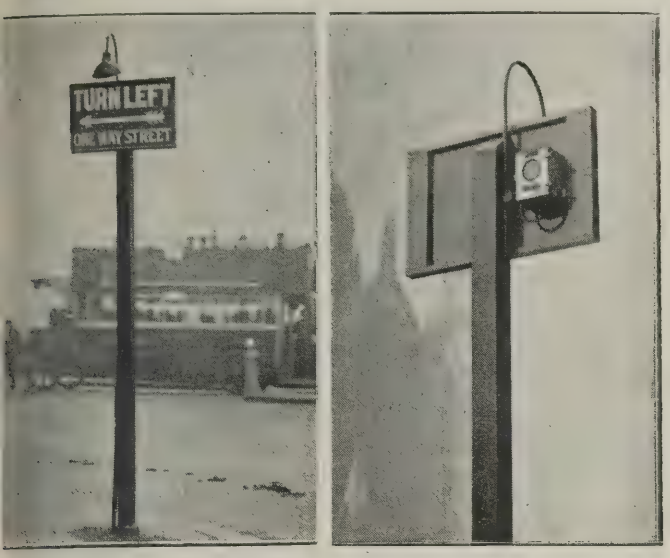
London Traffic Inquiry.—The inquiry into the travelling facilities of East London was concluded on March 29th by a sub-committee of the London and Home Counties Traffic Advisory Committee at the Middlesex Guildhall. Further proposals put forward for relieving traffic congestion were a circular tramway route turning down Mansfield Street, on the left of Whitechapel High Street and continuing through the Minories back into Aldgate High Street, and so completing the circular route, and that the sewer known as the Northern Outfall running from Bow Road to Barking should be used as a tramway track, by raising the waste land on each side of the sewer and using it for the tramway only.

New Branch of the E.A.W.—There was a large and representative attendance at the inaugural meeting of the Manchester District Branch of the Electrical Association for Women held on March 25th at the Town Hall, Manchester. Alderman Dagnall, the chairman of the Electricity Committee, presided and noted that one of the objects of the Association was to advance the general use of electricity in the interest of housewives. He had used electricity in his own house for 14 years and at present had neither a gas nor a coal fire.

Miss Haslett, director of the Association, detailed the history of the Association from its inception eighteen months ago. The Glasgow branch now had 200 members; Birmingham had started well and the Manchester branch was their third venture. The Association had sought to put forward the point of view of the woman, who asked for a greater expansion in hire-purchase systems. It should be easier for working women to have electricity installed. Far more education work should be done in the schools in spreading simple electrical knowledge and that matter was having attention in the proper quarters.

Mr. S. J. Watson, electrical engineer, Salford, welcomed the formation of the new branch. Its main objects, he said, were to lighten labour in the home by means of improved apparatus. The need was great in that district on account of the tremendous amount of small property occupied by the working classes. Systems of easy payment were desirable.

Mr. Ellis, chairman of the North-Western Centre of the Institution of Electrical Engineers, encouraged the new branch. He hoped the Association would enter the wider field of considering the women engaged in electrical work. The application of electricity in the home was essentially a woman's business; and they should have women as electrical contractors.



Miss G. L. Entwistle, who had convened the meeting, thanked those who had helped to secure such a representative gathering, and indicated the future programme of the Branch.

Mr. H. C. Lamb, city electrical engineer, Manchester, agreed with the previous speakers as to the new venture. The designs of electrical apparatus for the home would be improved if users could be got to say what they thought about them.

Miss Baines moved the resolution to form the Manchester District Branch, which was seconded by Mrs. Robertson and carried unanimously. The first Council was formed, and Miss G. L. Entwistle was appointed hon. secretary.

The Post Office Tube Railway.—The *Daily Mail* states that it is anticipated that the Post Office London Tube Railway will be available for traffic in the autumn. The total cost up to date has been £1,407,000.

Illuminated Traffic Signs.—The accompanying illustrations show the back and front views of one of the signs which have recently been placed in Parliament Square in connection with the new traffic-guidance regulations. The front of the board is illuminated at the necessary times by means of a suitable bracket lamp which is controlled by a Venner time switch, the latter being fixed on the back of the board.

Illuminated Traffic Signal Posts.

Institution Notes.

Institution of Electrical Engineers.—The arrangements for the remainder of Session 1925-26 include the following items :—

Ordinary Meetings of the Institution.

April 8th.—Mr. S. Mavor. "The Applications of Machinery at the Coal Face."

April 8th.—Mr. L. Miller. "The Design of Storage-Battery Locomotives for use in Coal Mines."

April 8th.—Mr. R. Nelson. "Electricity in Mines: A Short Survey."

April 22nd.—Sir J. J. Thomson, O.M., M.A., F.R.S. The Seventeenth Kelvin Lecture. "The Mechanics of the Electric Field."

April 29th.—Messrs. B. S. Cohen, A. J. Aldridge, and W. West, B.A. "The Frequency Characteristics of Telephone Systems, and Audio-Frequency Apparatus and their Measurement."

May 27th.—Annual general meeting.

June 24th.—Annual conversazione.

Wireless Section Meetings.

April 14th.—Mr. E. H. Shaughnessy, O.B.E. "The Rugby Radio Station of the British Post Office."

May 5th.—Mr. R. L. Smith-Rose, Ph.D., M.Sc., and R. H. Barfield, M.Sc. "On the Lateral Deviation of Wireless Waves and the Development of an Accurate Direction-Finder."

May 19th.—Messrs. M. Thompson, M.A., R. H. Dudderidge, and J. G. A. Sims, M.Sc. (Communication from the staff of the Research Laboratories, General Electric Co., Ltd., Wembley.) "Life-Testing of Small Thermionic Valves."

June 2nd.—Mr. P. W. Willans. "Low-Frequency Intervalve Transformer."

Informal Meeting.

April 12th.—Discussion on "The Linking together of Wireless and Wire Communication Systems." (Opened by Captain P. P. Eckersley.)

Summer Meeting.—The summer meeting of the Institution is to be held this year at the North-Eastern Centre (chairman: Mr. R. W. Gregory) during the week ending June 12th. Members will assemble to meet the local committee at the Central Station Hotel, Newcastle-upon-Tyne, on Monday evening, June 7th, and this year one evening during the week (Thursday, June 10th) has been left free, which will be appreciated by those who have friends in the district. The works to be visited are those of Sir W. G. Armstrong Whitworth & Co., Ltd., Messrs. J. H. Holmes & Co., Ltd., C. A. Parsons & Co., Ltd., and A. Reyrolle & Co., Ltd.; also the North Tees power station (Newcastle-upon-Tyne Electric Supply Co., Ltd.), a pit (Horden Collieries, Ltd.), a shipyard (Swan, Hunter and Wigham Richardson, Ltd.), a steel works rolling mills (Consett Iron Co., Ltd.), and the Lemington glass works (G.E.C.). There will also be an opportunity of seeing Durham Cathedral, and an excursion to Hexham and the Abbey has been arranged, together with the usual civic receptions, dances, &c. It is advisable to book hotel accommodation as early as possible, and members who have friends in the district are urged to endeavour to obtain private hospitality if possible, as the pressure on hotel accommodation in Newcastle during the summer is great.

Informal Meeting.—At the informal meeting on Monday, March 22nd, Mr. A. H. Allen was in the chair, when Mr. G. Rogers opened a discussion on "The Performance of Mercury Arc Rectifiers." Mr. Rogers is an official of the Birmingham electricity works, where he has control of about 10,000 kW of gasfilled rectifiers, and he has an unrivalled experience of this method of converting. He is an enthusiastic advocate of the apparatus, and the British-made rectifier now being produced has his complete approval. His opening was not a formal treatise, but was intended as a supplement to his paper read before the Institution. He therefore dealt at length with the difficulties and objections sometimes associated with rectifiers, and invited discussion of these opinions. He expressed the belief that the life of the valve, which, with reasonable care, was now very lengthy, would be almost indefinitely prolonged by the oil-jacketing as applied to the latest types. The rise of temperature and the ventilation of the cylinder had been the chief difficulties hitherto, and it would seem that oil cooling would eliminate these troubles. An exceptionally prolonged and interesting discussion followed, in the course of which Mr. A. Honeysett said he had dispatched to a remote pumping installation some 300 kW of English rectifiers, which had made a perilous journey quite successfully and had now been in operation for a long period, giving every evidence of entire reliability.

Local Wireless Sections.—The Committee of the North-Western Centre, at the request of the Council, is considering the formation of a Local Wireless Section, and has issued a questionnaire on the subject to its members.

Incorporated Municipal Electrical Association.—Annual Convention.—The preliminary programme of the Convention to be held at Glasgow, from June 14th to 19th, 1926, has just been issued. On Monday, June 14th, there will be a reception by the President and Mrs. R. B. Mitchell, Councillor Dr. Dewar (convener of Electricity Committee) and Mrs. Dewar. On Tuesday the Convention will be opened in St. Andrew's Hall with a civic welcome by the Lord Provost of Glasgow, Sir Matthew W. Montgomery, followed by the presidential address of Mr. R. B. Mitchell, and a paper on "The Practical Working of the Principles of Whitleyism from a Management Point of View," by Alderman W. Walker, M.I.E.E., M.I.Mech.E. After luncheon, as guests of the Corporation of Glasgow, there will be a visit to Dalmarnock power station, and in the evening the Lord Provost and Magistrates will hold a reception, with dancing and a concert, in the City Chambers. On Wednesday a paper will be read on "Supplies to Outlying Districts," by Mr. S. E. Britton, M.I.E.E., M.I.Mech.E., and in the afternoon a visit to Messrs. Babcock & Wilcox's works (Renfrew) will take place. On Thursday papers will be read on "Operating Costs of Electric Battery Vehicles," by Mr. C. W. Marshall, and "Industrial Heating," by Mr. A. P. M. Fleming. The annual dinner will be held in the evening. On Friday, after the annual general meeting there will be a visit to the Falls of Clyde (Clyde Valley Co.'s hydro-electric scheme), or to the Trossachs. On Saturday the events are a visit to the tramway power station at Pinkston, and an inspection of the bulk supply 33,000-volt overhead line between Greenock and Paisley. An exhibition, comprising electric cooking and water-heating apparatus, together with any other apparatus or appliances of interest to electricity supply authorities, will be held in Sauchiehall Street, close to the Corporation Electricity Department's showrooms. There will be included in the exhibition a demonstration of modern lighting methods. All communications prior to June 10th should be sent to the secretary, I.M.E.A., Electric House, 38, High Street, Croydon.

Institute of Transport.—Examinations, 1926.—As a result of the large number of applications to sit for the Graduateship and Associate Membership examinations to be held on April 15th and 16th next, the Institute Council has aranged for candidates to be examined at the following centres :—London: King's College, Strand, W.C.2. Manchester: High School of Commerce, Spring Gardens. Leeds: The University.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

It was reported to the Haslingden Town Council, on March 25th, that the Whitley Council recommended an increase of £50 in the salary of the tramway manager.

Mr. George P. Shallcross, who has been electrical engineer to the Birkenhead Corporation since 1913, will retire in June next, having reached the age limit. He has been in the service of the Corporation for 27 years, and has carried out many extensions to the electricity supply in the borough and the adjoining districts. The Town Council, at its meeting on March 31st, will be recommended by the Electricity Committee to approve the appointment of Mr. Francis Edward Spencer, the assistant electrical engineer, to succeed Mr. Shallcross. Mr. Spencer, who is 44 years of age, entered the service of the Corporation as switchboard attendant in 1899. He was appointed to his present position in 1913.

Sir Benjamin Longbottom, of Electromotors, Ltd., was on March 26th elected president of the Manchester Association of Engineers.

Last Saturday afternoon Mr. R. B. Mitchell inaugurated a new pavilion at the grounds laid out at Dalmarnock for recreation in connection with the Glasgow Corporation Electricity Department's welfare movement. Mr. Mitchell, who is to represent the I.M.E.A. at the conferences of the International Electrotechnical Commission in New York, was to

sail from Southampton on April 2nd. Following the ceremony on Saturday, he was presented with a fitted dressing case, a cabin trunk, and a travelling rug for his voyage.

Prof. W. Peterson, of the Technical High School, Darmstadt, has been elected a director of the Allgemeine Elektrizitats Gesellschaft, of Berlin, in succession to the late Prof. Dr. Klingenberg.

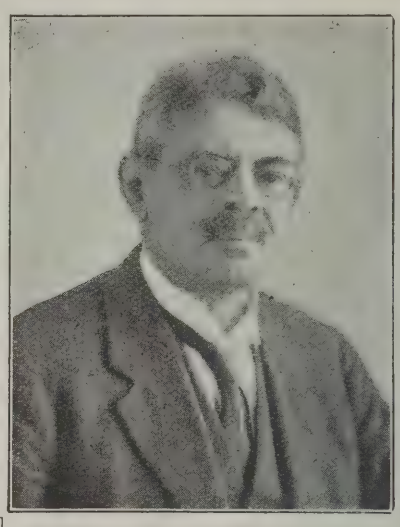
Accrington Electricity Committee recommends that the electrical engineer's bonus be increased from £165 to £214, making his total remuneration £914 per annum.

Mr. E. T. Wright, A.M.C.T., son of Mr. Arthur S. Wright, of Blackpool, has been appointed principal electrical engineer at the Manchester offices of the Traction Equipment Co. Mr. E. T. Wright was for over eight years with the Metropolitan-Vickers Co. at Trafford Park; he left that company to take up his present position. He was recently married to Miss Vera M. Brooke, daughter of Mr. W. A. Brooke, Altrincham.

Mr. A. P. M. Fleming, manager of the Research and Education Department of the Metropolitan-Vickers Electrical Company, was one of the chief visiting speakers to crowded gatherings in the course of the City of Bradford Education Week, which ended on March 27th.

Mr. J. W. Negus, foreman of the overhead equipment section of the Bradford City Tramways Department, retired at the end of March after over 40 years' service in the local tramways. He was presented with a silver rose bowl and case of pipes.

Mr. A. A. Campbell Swinton, F.R.S., has given up his offices at Victoria Street, S.W., and all communications should be sent to him at 40, Chester Square, S.W.1, which is his sole permanent address.



In March Mr. F. H. Livens, M.I.Mech.E., director and chief engineer of Messrs. Ruston & Hornsby, Ltd., completed 50 years' service with the company. At a board meeting on March 23rd the chairman, on behalf of the company and directors, presented him with an oil painting. The picture is by Niemann, and the subject, "Lincoln," as seen in 1858 from the Witham banks of the south-east of the city.

Ald. J. Cope has just completed 25 years as chairman of the Tramways Committee of the Walsall Corporation. On Friday last he was presented with an oak armchair (made from an old tramway sleeper), a wallet, and an illuminated address, from the staff and employés of the undertaking.

The John Fritz Medal Board of Award, representing the American Societies of Civil, Mining, Mechanical, and Electrical Engineers, announces the presentation of the John Fritz gold medal to Edward Dean Adams, "engineer, financier, scientist, whose vision, courage and industry made possible at Niagara Falls the birth of hydro-electric power."

Obituary.—Mr. Francis Hird.—We regret to record that Mr. Francis Hird, B.A.(Cantab.), managing director of Siemens Bros. & Co., Ltd., passed away on March 25th at Lanark House, Old Charlton, S.E.7, in his 59th year. Mr. Hird was also managing director of Siemens & English Electric Lamp Co., Ltd., and Caxton Electric Developments, Ltd. He was further a director of the following companies:—Siemens and General Electric Railway Signal Co., Ltd.; Elliott Bros. (London), Ltd.; the Enfield Cable Works, Ltd.; St. Helen's Cable & Rubber Co., Ltd.; and the Fixed Price Light Co., Ltd. Mr. Francis Hird was born—of British parentage—in Paris in 1868. He came to England in early childhood, and was educated at the Bradford Grammar School, from which he obtained a Natural Sciences Exhibition at Trinity College, Cambridge, and studied under Professor J. J. Thomson at the Cavendish Laboratory. He obtained a First Class in the Natural Sciences Tripos, and took his degree of B.A. in 1887 at the rather unusually early age of 19. In 1889 Mr. Hird joined the staff of Messrs. Siemens Bros. & Co., Ltd., and after a few years became chief dynamo designer to that company. In due course, after having gained some commercial experience, he became head of the company's Electric Light and Power Department. In connection with the various activities in electrical development proceeding at that time, it may be mentioned that Mr. Hird took a considerable personal share in the design and construction of the original equipment of the Waterloo and City Railway. For some time he was works manager of Siemens Bros.' Dynamo Works, Ltd., at Stafford, subsequently returning to Siemens Bros. & Co., Ltd., in order to take charge of their Apparatus Department and to develop their light-current work generally. In this connection he inaugurated their Telephone Department, and thus enabled Siemens Bros. & Co. to be among the first to introduce practical automatic telephone exchanges in this country. Mr. Hird was appointed general manager of Siemens Bros. and Co., Ltd., in 1922, and managing director in April, 1925. He leaves a widow and two daughters.

The funeral took place on Saturday last at Charlton Cemetery. A service was held at St. Paul's Church, Old Charlton, prior to the interment. It was conducted by the Rev. Derman Christopherson, M.A., and the lesson was read by Sir William Bull, M.P., a co-director of Mr. Hird's. Those present in addition to his widow, two daughters, and other relatives, included Mr. G. Mure Ritchie, chairman of Siemens Brothers & Co., Ltd.; Mr. W. O. Smith, M.I.E.E., one of the directors of the company; Dr. H. Wright, general manager of Siemens Brothers and Co., Ltd., and members of the Company's staff; representatives of Siemens & English Electric Lamp Co., Ltd., Siemens and General Electric Railway Signal Co., Ltd., and Elliott Brothers (London), Ltd.; Sir G. H. Hume, M.P., chairman of the London County Council; Mr. L. B. Atkinson (Cable-Makers' Association); Mr. M. J. Railing (General Electric Co., Ltd.); Mr. R. G. Cavell, representing Sir Alexander Roger, chairman of the Automatic Telephone Manufacturing Co., Ltd.; Sir Frank Dyson, Astronomer Royal; and representatives of the Siemens Foremen's Association, the Siemens Staff Club, and the Siemens Sports Club.

Elliott & Fry] [*London.*

The late Mr. Francis Hird, B.A., M.I.E.E.

Prof. A. Witz.—The death recently took place in Lille, France, at the age of 77 years, of Prof. Aimé Witz. The deceased was an authority on internal combustion engines and heat utilisation, and had taken a prominent part in electrical developments in France.

Alderman Smithson.—We regret to record that Alderman R. A. Smithson, who had been a member of the Leeds City Council for 30 years and had taken a leading part in connection with the tramways, passed away last week.

Mr. G. S. Corlett.—We regret to note that Mr. George Stephen Corlett, M.I.E.E., M.I.Mining E., passed away at Wigan on Sunday last, March 28th. Mr. Corlett, who was born in the Isle of Man in 1866, was articled to Mr. Sydney F. Walker, of Cardiff, and after some years engineering experience he was from 1890-92 with Messrs. Mercier, Corlett and Co., electrical contractors at Wigan, and subsequently managing director of the Corlett Electrical Engineering Co., Ltd., from 1892-1914. In the latter year he started as a consulting engineer, and specialised in the carrying out of electrical installation work in English and Welsh Collieries. Mr. Corlett was a past-president of the Association of Mining Electrical Engineers.

Wills.—The late Mr. Arthur L. Cottam, wholesale electrical supplies factor, Bristol, left £8,591.

According to *The Times*, Mr. William Hampson, a leading member of the Council of the Röntgen Society and lately medical officer in charge of the electrical and X-ray departments of the Queen's Hospital for Children, left £5,574.

New Companies Registered.

Esono, Ltd. (212,669).—Private company. Registered March 24th. Capital, £1,500 in 1,000 ordinary shares of £1 and 10,000 deferred shares of 1s. Objects: To acquire (1) from W. Edwards the registered trade mark "Esono," (2) the tenancy of premises at 492, Prescot Road, Old Swan, Liverpool, together with the tenant's fixtures, fittings and tools therein, personal property, and assets of the proprietor of the business known as "Edwards, Son & Co.," electrical, mechanical, radio and automobile engineers, and the goodwill thereof; and (3) the tenancy of the premises and workshop at rear thereof, together with the business, assets and liabilities of William Roberts as a building contractor, and all fixtures, fittings, personal property and assets of the proprietor of that business. The permanent directors are:—Mrs. Annie P. Edwards, 1a, Childers Street, Old Swan, Liverpool; W. Edwards, 1a, Childers Street, Old Swan, Liverpool, electrical engineer (managing director); J. J. Fox, 28, Richard Kelly Drive, Walton, Liverpool, book-keeper; W. Roberts, 344, Queen's Drive, Knotty Ash, Liverpool, jobbing contractor. L. Carlen, 45, Osborne Road, Tuebrook, Liverpool, electrician. Qualification, £10. Remuneration, £150 per annum, divided between them. Solicitors: Bartlett & Son, 30, North John Street, Liverpool.

Cogent Electrical Co., Ltd. (212,526).—Private company. Registered March 19th. Capital, £500 in £1 shares. Objects: To carry on the business of electricians, electrical contractors, electrical, mechanical and general engineers, manufacturers of electric or other motors, electric or other lighting sets, toys of all kinds, and parts relating to wireless, &c. The directors are:—A. J. Singlehurst, 30, Falkner Street, Liverpool, electrical engineer; G. H. Miller, 17, Sunningdale Road, Wallasey, Cheshire, wireless operator. Qualification, £100. Solicitors: T. J. Smith & Son, 7, Harrington Street, Liverpool. Registered office: 54, Berry Street, Liverpool.

Callingham Electric Supplies Co., Ltd. (212,628).—Private company. Registered March 23rd. Capital, £100 in £1 shares. Objects: To carry on the business of electricians, electrical engineers, mechanical engineers and manufacturers, &c. The directors are:—G. Davis, 30, Penywern Road, Earl's Court, S.W.5; C. Howson, 144, Bromley Road, Beckenham, Kent. Qualification, £1. Solicitors: R. S. Jackson & Bowles, Ingram Court, 167, Fenchurch Street, E.C.3. Registered office: 121, Westbourne Grove, W.2.

F. F. Chrestian & Co., Ltd. (E.2,519).—Incorporated outside U.K. Particulars were filed on March 19th, pursuant to Section 274 of the Companies (Consolidation) Act. The company was incorporated in Calcutta on January 6th, 1912. The Indian address is Domchanch, Bihar. The British address is Finsbury Court, E.C.3, where E. Berkeley, engineer, and A. Berkeley, chartered electrical engineer, are authorised to accept service of process and notices on behalf of the company. The directors are:—Sir Henry P. W. Macnaghten and Geoffrey L. Winterbotham, both Indian agents, of 9, Wallace Street, Bombay. No memorandum and articles of association have yet been filed.

Nivalight, Ltd. (212,639).—Private company. Registered March 23rd. £1,000 in £1 shares. Objects: To carry on the business of dealers in electric lamps, &c. The first directors are:—H. Kaphan, 159, Eastern Esplanade, Southend-on-Sea, merchant; H. G. Coxon, 190, Bishopsgate, E.C.2. Qualification, 2 shares. Solicitor: P. S. Costerton, 190, Bishopsgate, E.C. Registered office: Pooles Buildings, Mount Pleasant, Clerkenwell, W.C.1.

Truro Electricity Supply Co., Ltd. (212,726).—Private company. Registered March 26th. Capital, £5,000 in £1 shares. Objects:—To carry on in Truro, Cornwall, and elsewhere the business of an electric light and power company, &c. The first directors are:—A. N. Rye, 11, Tothill Street, Westminster, S.W. (general manager, Edmundsons Electricity Corporation, Ltd.); L. A. Hards, Penlu, Tuckingmill, Camborne, Cornwall (manager, Cornwall Electric Power Co.); C. H. Jones, 67, Hayes Road, Bromley, Kent. Qualification, £50 shares. Remuneration as fixed by the company. Solicitors: Godfrey, Warr, Clarkson & Co., 85, Gracechurch Street, E.C. Registered office: Broad Sanctuary Chambers, Tothill Street, Westminster, S.W.

Southern Lighting and Ignition Co., Ltd. (212,725).—Private company. Registered March 26th. Capital, £1,000 in £1 shares. Objects: To carry on the business of electrical, mechanical, motor and general engineers, manufacturers of and dealers in radiators, dynamos, magnetos, transformers, motors, and all kinds of electrical goods and plant, manufacturers of and dealers in motor cars, cycles, &c. The subscribers (each with one share) are:—W. T. Beer, 2, Westfields Road, Acton, W.3, solicitor; Ethel E. Windsor, 51, Campden Houses, Kensington, W.8, stenographer. The first directors are to be appointed by the subscribers. Solicitors: W. P. Guillet, 55, Berners Street, W.1.

London and South Wales Electrical Engineers, Ltd. (212,629).—Private company. Registered March 23rd. Capital, £5,000 in £1 shares. Objects: To carry on business as electrical engineers and contractors, general, mechanical, wireless and radio engineers, builders, contractors and dealers in metal, stone, wood, &c. The subscribers (each with one share) are:—H. B. Giles, 66, High Street, Marlow, Bucks., surveyor; H. J. Norris, 138, Ashley Down Road, Bristol, builder's general foreman. The first directors are to be appointed by the subscribers. H. B. Giles signs as manager. Qualification, 250 shares. Remuneration (except managing director or manager) as fixed by the company. Solicitors: Lewis Morgan, Browne and Haslam, 31, High Street, Cardiff. Registered office: Gordon Works, Crockherbtown Lane, Park Place, Cardiff.

Chorlton Metal Co., Ltd. (212,594).—Private company. Registered March 22nd. Capital, £1,000 in £1 shares. Objects:—To acquire the business of radio and wireless merchants, manufacturers, importers, and general dealers carried on by M. Hacker and L. M. Galansky at 60, Long Millgate, Manchester. The permanent directors are:—M. Hacker, 27, Brighton Grove, Fallowfield, Manchester, merchant; L. M. Galansky, 333, Waterloo Road, Hightown, Manchester, merchant. Qualification, £100. Remuneration as fixed by the company. Secretary and solicitor: J. Prior, 7, Brazennose Street, Manchester.

Dalry Electric Supply Co., Ltd. (14,059).—Private company. Registered in Edinburgh on March 20th. Capital, £2,000 in £1 shares. Objects: To carry on the business indicated by the title. The directors are:—Lord Sinclair, Milton Park Lodge, Dalry, Kirkcudbrightshire, 100 shares; T. Edgar, Newfield, Dalry, Kirkcudbrightshire, farmer, 200 shares; A. Young, Garrock, Dalry, Kirkcudbrightshire; W. R. Gourley, Kinbank, Dalry, Kirkcudbrightshire; Mrs. E. I. Chisholm, Lochinvar Hotel, Dalry; T. Rankin, Dalry, baker. Qualification, 25 shares. Secretary: A. Milroy.

Official Returns of Electrical Companies.

J. Springer, Ltd. (in liquidation), electrical consultants and engineers, &c.—R. H. Collett, of 84, Chancery Lane, E.C., ceased to act as receiver or manager on March 12th, 1926.

Satisfaction in full on March 12th, 1926, of debenture dated December 30th, 1922, securing £7,000.

Johnson, Savage & Co., Ltd.—A. P. Barber, of 35, Walbrook, E.C.4, was appointed receiver on March 16th, 1926, under powers contained in first debenture dated October 14th, 1924.

Neutron, Ltd.—W. S. Dawson, C.A., of 31, Great James Street, Bedford Row, W.C., was appointed receiver and manager on March 17th, 1926, under powers contained in debenture dated September 29th, 1924.

Richard Marsden & Son, Ltd.—Mortgage on 115, Church Street, Preston, with machinery, &c., dated March 12th, 1926, to secure all moneys due or to become due from the company to the Midland Bank, Ltd.

Electricity Distribution of North Wales and District, Ltd.—First mortgage debenture dated March 12th, 1926, to secure £100,000 charged on the company's undertaking and property, present and future, including uncalled capital. Holder: The Treasury Solicitor. (The company may not without the sanction of the Commissioners of H.M. Treasury and the registered holder create any mortgage or charge on any part of its property or assets ranking, *pari passu*, with or in priority to this charge.)

Normand Electrical Co., Ltd.—Particulars filed of £2,000 debentures authorised December 3rd, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £1,200.

C. J. Thursfield & Co., Ltd.—Satisfaction in full on March 16th, 1926, of debentures dated December 27th, 1922, to December 16th, 1925, securing in all £3,250.

Watford Radio Supplies, Ltd.—W. R. Faulkner, of 133, Lower Paddock Road, Oxhey, Watford, ceased to act as receiver on February 20th, 1926.

Morley Electrical Engineering Co., Ltd. (52,358).—Capital, £5,000 in £1 shares. Return dated February 22nd, 1926. All shares taken up. £3,980 paid. £1,020 considered as paid. Mortgages and charges, £3,000.

Lamp Manufacturing Co., Ltd. (76,151).—Capital, £10,000 in £1 shares. Return dated February 11th, 1926. 5,400 shares taken up. £5,400 paid. Mortgages and charges, £2,500 debentures.

British Brown, Boveri, Ltd. (89,167).—Capital, £50,000 in £5 shares. Return dated December 18th 1925. All shares taken up. £21,250 paid (being £2 10s. per share on 8,500 shares). £7,500 considered as paid (being £5 per share on 1,500 shares). Mortgages and charges, nil.

Sturge & Baker, Ltd. (181,382).—Capital, £8,000 in £1 shares (1,500 preference and 6,500 ordinary). Return dated February 9th, 1926. 1,500 preference and 5,896 ordinary shares taken up. £7,396 considered as paid. Mortgages and charges, nil.

Torpoint Electric Supply Co., Ltd.—Satisfaction in full on February 27th, 1926, of debentures dated June 11th, 1923, securing £5,500. Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated February 27th, 1926, to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd.

Bower Electric (1926), Ltd.—Particulars filed of £1,500 debentures authorised January 28th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Energo Products, Ltd.—Debenture dated February 22nd, 1926, to secure £1,244 11s. 8d., charged on the company's undertaking and property, including uncalled capital. Holders: V. B. M. Mallentjer, 57, Scarsdales Villas, W.8; and A. L. Vandervelde, 166, Marylebone Road, W.8.

Hammersley Brothers, Ltd.—Particulars filed of £500 debentures authorised March 8th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £300.

Atkins & Wallis, Ltd.—Particulars filed of £500 debentures authorised February 26th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, the amount of the present issue being £250.

Bell Battery and Accessory Co., Ltd.—F. Wilcock, of 1, Great Winchester Street, E.C.2, ceased to act as receiver or manager on February 27th, 1926.

Siemens Brothers & Co., Ltd.—Satisfaction to the extent of £20,000 on January 1st, 1926, of debenture stock dated January 15th, 1918, securing £1,330,000.

Glantawe Electric Supply Co., Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated February 19th, 1926, to secure all moneys due or to become due from the company to Barclay's Bank, Ltd.

W. S. Jeal & Ebury Engineering Co., Ltd.—A. E. Tilley, of 8, Staple Inn, Holborn, W.C.1, ceased to act as receiver or manager on March 15th, 1926.

Orford Electric Light and Power Co., Ltd.—Issue on March 9th, 1926, of £300 debentures, part of a series already registered.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Metropolitan-Vickers Electrical Co., Ltd.

The annual meeting was held on March 23rd, Major-Gen. Sir Philip A. M. Nash, K.C.M.G., in the chair. In proposing the adoption of the report (*vide* our last issue, p. 510), the Chairman said that for some time past there had been a falling off in orders for heavy electrical plant in the home market, which position, in his opinion, had been partly created by the pending legislation in connection with the supply of electrical energy. During the last ten days or so two publications of very great importance to the electrical manufacturing industry had appeared. One was the report of Lord Weir's Committee, which not only gave an account of the progress of the supply of electrical energy up to date, but also set forth the steps necessary to bring this country up to a standard which would place it more on an equality with other big producing countries. The Committee recognised that Great Britain was favourably placed as a potential producer and distributor of cheap electrical energy, and that to remedy the backward condition in which our country to-day found itself, it was not merely a question of cheap generation of power in large power stations, but it was just as much a problem of proper transmission and distribution of energy. The report showed the great possibilities that lay before a large manufacturing concern like theirs, and he could assure them that the company possessed resources of both plant and personnel which were fully capable of taking their full share of that great electrical development. The draft Bill appeared to give effect to most of the recommendations of the Committee, particularly the setting up of a Central Electricity Board, but it appeared to him that under the terms of the Bill the Central Electricity Board was being surrounded by such restrictions as to make it doubtful whether it could function effectively and quickly. As manufacturers the company desired naturally to support legislation on broad national grounds, which would increase the use of electricity in this country, but at the same time they deprecated any steps being taken that would even temporarily restrict the progress, which large power undertakings—many of which were municipally owned—had been making during the last five years under existing conditions. The company had had its full share of business from such concerns, and he feared that progress might be arrested for the time being, and they must be prepared to see a falling off in their home sales, at any rate until the Bill had got a good long distance in its passage through Parliament. Another document which had just been published and was of very great importance to the electrical industry, was the report of the Royal Commission on the Coal Industry. That Commission had recorded its opinion that the development of electricity supply under the new proposals of the Government must be closely co-ordinated with such generation of electricity at the mines as might be undertaken by the suggested Coal Controlling Authority. There seemed to be a danger of confusion and overlapping between the work of the Electricity Board suggested in the Electricity Bill and the Fuel and Power Committee. It would appear to be necessary that in the creation of those new bodies care should be

taken that in so far as electricity was generated under the operations of the body set up under the Coal Commission's Report, that should be closely co-ordinated in some way with the work of the Electricity Commissioners and the contemplated Central Electricity Board. Reverting to the company's affairs, Sir Philip said that the export business since January 1st had been satisfactory in volume and indicated an ever increasing hold of the company on Dominion, Colonial and foreign markets. The export business obtained during 1925 constituted a tonnage record in the history of the company and there was every indication at the present time that they would be able to maintain that during the current year. There was still only the barest margin of profit in such business; competition grew, if anything, more severe, but the business was essential to the company, not only from the small profit which it contained, but more particularly from the point of view of the employment of workmen and of absorbing the heavy standing charges incidental to a highly technical business such as theirs. Export work was all-important from another point of view. Owing to the relatively backward condition of this country electrically, their largest units in practically every line of manufactures went abroad, and in addition their new technical developments, which alone could keep them in the forefront of the industry, arose almost entirely from the needs of the export market. The carrying on of this work should put them in the best possible position to tackle the large developments at home which were expected from the electricity legislation now before Parliament. Among the countries from which they had continued to obtain business were Norway, Russia, Holland, Rumania, Belgium, Spain, Persia, Burma, Palestine, China, Japan, India, Australia, New Zealand, South Africa, Brazil, Argentina, and Chile. The largest rotary converters that they had ever built went last year to New South Wales, and they were now constructing a turbo-generator unit and condensing plant for Japan larger than any that they had previously produced. The same remark applied to three water-wheel alternators now being constructed for Chile. The operation of the seventy-eight locomotives built for the South African Government had been satisfactory and they received last year a repeat order for seventeen additional locomotives. It was of interest to note that the great buk of the traction work carried out by the company and other English companies during the last three years had come from abroad, and in every instance where the electrification was in active operation, the financial results had more than justified the calculations on which it was based. Another development progressing with ever-increasing volume was that of automatic converter sub-stations with, in many cases, the addition of supervisory control; the order for sixteen rotary converters for the Bombay, Baroda and Central India Railway electrification, with its complement of transformers, switchgear, and control apparatus, was a good example of that kind of work. South Africa also provided some special features in the orders for a number of very large winders for the Rand Mines, among which was that for the City Deep Mine believed to be the largest electric winder ever ordered. Having referred with satisfaction to the progress which was being made by the separate company formed to deal with the supply side of the company's activities, and to the continued good work of the research and education departments, the Chairman concluded by stating that the relation between the management and the workers continued to be of the most satisfactory character and in that connection he mentioned that one of their machinists and the chairman of their works committee was chosen as the representative of the electrical industry in the party of workers now in the United States under the auspices of the *Daily Mail*. Mr. Alex Spencer, the vice-chairman, seconded the motion, which was carried unanimously.

British Electric Transformer Co., Ltd.

The annual meeting was held on March 25th, Mr. A. F. Berry, chairman of the company, presiding. In presenting the report and accounts, which were reviewed in our last issue (p. 511)), the chairman said that the company had started the year under review with a fair amount of work in hand, but the rate of improvement did not continue, so that the second half of the year did not yield so substantial a return as they might reasonably have expected. Immediately there were signs of upheaval in any one of our staple industries, the news was flashed round the world, and orders which would have come here were deflected to those countries from which delivery could definitely be relied upon. Unlike the electricity supply industry, manufacturers had no monopoly, but had stern competition from all sides, and to some extent their general charges must be borne by export work. He hoped that orders would not be sent abroad while manufacturers of this country had so great a need of the work. With regard to the future, the chairman said that, given a year free from interruption and work coming in as at present, they might hope to hold their own with difficulty. To secure the volume of work which they required at prices yielding even a small profit, was as hard to-day as they had ever known it. The holders of the ordinary shares had not yet any return in the way of dividend, but the preference shareholders had at least the satisfaction of seeing the substantial arrears of dividend paid off. Had it not been for those arrears of preference dividend, the ordinary shareholders might reasonably have expected some small return on their holdings. Electrical manufacturing companies, like most other engineering firms, still laboured under difficulties with regard to low wages, which were difficult to remedy. So long as men in " sheltered " occupations received wages in excess of those that could possibly be paid to their skilled men, no one in the engineering industries could feel satisfied. The elimination of that fundamental difficulty seemed but little nearer than a year ago. As a manufacturing country dependent on obtaining orders from abroad, every effort should be made to reduce risks of dislocation of industry. Foreign customers would not place their orders here unless they could feel certain that their goods would be delivered to time. The recent interest in the ordinary shares of electrical manufacturing firms seems to have been occasioned chiefly by the publicity received by the Government's Electricity Bill. While they all hoped that something useful would emerge from the proposals contained in the Bill, it was certain that the utmost goodwill and hearty co-operation of the various interests concerned would be needed if the country in general and the electrical trades in particular were to derive much benefit from the Bill. In the electrical industry the moderate success achieved so far was mainly the result of individual initiative and enterprise, and in spite of legislation, rather than because of it. Even now it was not certain whether the good to the country or to the industry resulting from the publicity that had heralded the Government's proposals, might not even set us back temporarily. Unfortunately, since the Government proposals had been brought forward, there was a feeling amongst many who ought to know better, that electricity was "*going* to be cheap," whereas in point of fact in many places it was not only cheap to-day, but ready to hand. Referring to the Company's domestic appliance business, Mr. Berry said that the development of the heating and cooking load had undoubtedly begun to stimulate the demand for electrical plant, machinery, cables, switchgear, &c. Electrical equipment firms, such as their own, would surely reap much added business from the development of that section of industry. The report and accounts were adopted.

British Insulated Cables, Ltd.

Mr. James Taylor (chairman) presided at the annual meeting on March 22nd, and in moving the adoption of the report and accounts (ELEC. REV., March 19th, p. 472), said that a great deal of the remarkable increase in the profit was attributable to increased dividends received on investments. Apart from their strictly manufacturing business, they undertook large contracts for the laying of cables, erection of power lines, and the electrification of railways, and provision was made out of profits to cover them against unforeseen contingencies. Such contracts frequently took several years to complete, and during the past year the work under some of them was finished and credit balances were left, which they had been able to take into their accounts. Of late years they had spent large sums in improving and extending their factories and they were now reaping the benefit in lower manufacturing costs. Another reason for the larger profit was the greatly increased output. None of the profit had been derived from higher prices to customers. To show that their workpeople had participated in the company's prosperity, Mr. Taylor said that in 1913 wages at the Prescot works represented 10.80 per cent. of the turnover; in 1925 the wages amounted to 18.50 per cent. On the other hand, dividends had fallen from 7.12 per cent. of the turnover in 1913 to 5.14 per cent. in 1925; thus, to maintain the dividend they had had to increase their turnover. Dealing with the activities of the company during the past year, the chairman said that they had disposed of their lamp business, which in some ways interfered with their more legitimate business. The trade of the Indian Cable Co., Ltd., was steadily growing and progressing satisfactorily. During the year about £300,000 had been spent in the extension of buildings, plant, and machinery, and they now had one of the most efficient factories in the country. Investments in other undertakings during the year had increased by about £84,000. The Midland Electric Corporation, in which they held a considerable interest, continued to do well, maintaining the dividend and bonus of 15 per cent., as well as offering a new issue of shares at a bonus price to existing shareholders. The Electric Supply Co. of Victoria had put in new plant which was working well, and had improved the company's position. The Automatic Telephone Manufacturing Co. was also progressing satisfactorily. Their bonus scheme, by which the staff received part of their payment according to output, was proving very successful. The scheme was originated when the share capital was only £500,000, the basis being that after 10 per cent. had been paid in dividends, the staff participated in the profits. Two subsequent issues of bonus shares had necessitated readjustments of the basis, but the staff had not suffered any loss and the directors believed that they were studying the best interests of the shareholders by securing that every member of the staff had a personal incentive to produce the best results. The report and accounts were adopted, and a proposal to increase the directors' remuneration was approved, subject to confirmation at a later meeting.

County of London Electric Supply Co., Ltd.

The annual meeting was held on March 23rd. Sir Harry Renwick, K.B.E., who presided, said that the report (ELEC. REV., March 19th, p. 471), was the most satisfactory one yet presented to the shareholders. The gross receipts showed an increase well over £90,000, and of this increase £70,000 arose from the increased sale of energy and meter rentals, notwithstanding the fact that the rates had been reduced. The net profit showed an increase of over £70,000 and the company was placing to various reserve accounts a total of £560,000. The sum carried forward had been

reduced as the new Act obviated the necessity of carrying forward the usual large amount. The increase in working costs was mainly due to rates and taxes, but the price of coal was lower, and he emphasised that last year's costs received practically no benefit from the new Barking station. The output of energy increased by over 15 million kWh and the total output was now approaching the 100 million kWh mark. The applications for supply amounted to 25,187 kW, including bulk and railway supplies, making the total connected load over 166,000 kW. The most satisfactory feature about the new business was the growth of bulk and railway supplies, which, in future, would form an important factor in the development of the business. Dealing with the Barking power station, the chairman said that additional capital expenditure amounting to £970,000 had been incurred during the year. The station was opened by the King in May last. It naturally took some time to get the station in proper operation; they had had some trouble with the 33,000-V transmission lines connecting the station with the London area, but those difficulties had now been largely overcome, and the company would have all the equipment available necessary to meet the heavy autumn load. Sir Harry then reviewed the position under the London Electricity (No. 1) Act, 1925. He said that the valuation of properties had not yet been fixed, nor the standard price upon which charges to consumers were dependent. In the meantime they were carrying out in practice the object of the Act by interconnecting the generating stations of the companies in the group, and by the giving and taking of bulk supplies. In furtherance of the same policy, interconnecting mains were being laid between the Barking station and the generating stations of the Kent Electric Power Co. and the North Metropolitan Electric Power Supply Co. He was afraid that he was not in a position to throw much light upon the Government's electricity proposals owing to the shortness of time allowed him for the study of the Bill. He did not know whether the Barking power house was to be a "selected" station under the Bill, but they were entitled to conclude that the company and other London supply companies would remain unaffected, seeing that the London situation was settled under the Acts of last year. He was in sympathy with any scheme which had for its object the provision of a cheap supply in bulk—a matter which was long overdue—but it was by no means clear that the Government scheme would provide a cheap supply. Bulk supply was of vast importance to small undertakings, and he could not understand how any such undertaking could refuse to take it, if it was available on reasonable terms and conditions. Bulk supply had converted struggling profitless undertakings into prosperous profit-earning ones. He deprecated the imaginings of journalists which misled the public with regard to the electricity situation, and particularly condemned the common error that the best site for a power station was at the pit's mouth. Such misleading effusions were not likely to assist in the least degree in understanding the very difficult technical problem now before the country. Looking ahead, Sir Harry said that they were justified in anticipating another successful year; the new business secured to date considerably exceeded the corresponding figure for last year, and the works costs so far showed a satisfactory reduction. They had extended their area of supply by some 24 square miles, and were further reducing the rates to consumers. In conclusion, the chairman referred to the appointment of Mr. Archibald Page as general manager, with a seat on the board, and that of Mr. Hobson as joint manager of the company.

Clyde Valley Electrical Power Co.

This company's report was reviewed in our issue of March 19th (p. 472). The annual meeting was held on March 24th. Mr. R. Robertson presided in the absence of Sir Frederick Gardner (chairman) and the deputy-chairman, and in the course of his speech said that the report was highly satisfactory and attested the vigour with which the area was being developed. Extensions in various directions had been proceeding steadily, and during the current year they would be in a position to supply electricity to Helensburgh, Cardross, Vale of Leven, Kirkintilloch, Lanark, Carluke, Kilmacolm, and Bridge of Weir. The company now had over 600 miles of e.h.p. and l.p. mains and 253 sub-stations in operation, and there were eight sub-stations in course of erection. The financial position of the company was sound, and if left to themselves, without undue Government interference, they could look forward to the future with confidence. They had successfully resisted an attempt by the Glasgow Corporation to infringe their rights and they hoped that all contentious matters between the company and the Corporation had now been settled. Mr. Robertson then turned to the Government's Electricity Bill, and said that the company was one of those authorities with a non-standard frequency. He considered that the estimate of eight million pounds as the cost of standardising frequency was far too low. It would, moreover, inevitably increase the cost of electricity to the consumers for many years. While the contemplated expenditure of £33,500,000, if carried out with due regard to economic considerations, would ultimately effect a saving in generating costs, it was inevitable that the immediate burdens would fall most heavily upon the districts served by the owners of "selected" stations. The period of guarantee was totally inadequate, as the charges for interest and sinking fund on the large capital expenditure were not to become effective for the first five years. The scheme appeared to be based upon certain estimates prepared for the Weir Committee, showing the probable results of the scheme over a series of years. So far as the West of Scotland was concerned, those figures were extremely optimistic; if they were not fulfilled, the expected economies would not be fully realised. In conclusion, Mr. Robertson said that the goal which it was hoped to reach, in 1940 or thereabouts, was an average rate to consumers of 1d. per kWh. The company's average rate last year was 0.889d., and in view of the reduction in the price of coal a still lower figure should be reached during the current year.

Newcastle-upon-Tyne Electric Supply Co., Ltd.

Mr. R. P. Sloan (chairman and managing director) presided at the annual meeting on March 23rd. In moving the adoption of the report (*vide* our last issue, p. 510), Mr. Sloan said that the outlook in the more important industries on the North-East Coast was still far from bright, but in spite of the depression the company had not only maintained its position, but had to some extent improved it by the exercise of economies and steady development. Last year's profit showed an increase of over £41,000, which in the circumstances could be considered satisfactory. The horse-power connected amounted to 27,842—only 1,840 h.p. less than was connected in the previous year. This was also satisfactory, in view of the prevailing adverse conditions. In 1924, 3,200 new customers were connected up and in 1925, 5,812. They hoped to reach a total of 12,000 during the current year, and the number of applications received so far indicated that that figure would be reached. Upon the whole he considered the outlook brighter to-day than it was 12 months ago. Referring to the Government's electricity scheme, the chairman said that he regretted that the public had been misled by wild statements made by politicians and others with little experience of the difficult problems involved. There was no short cut to the cheapening of supply; a scheme on the lines contemplated might, in time, result in certain economies being effected, many of which would, in the ordinary course, have been effected in any case, but he was afraid that if they had to rely merely upon any such scheme, the process of cost reduction would be very slow, and much disappointment would result. The only way of bringing about any substantial reduction of costs to consumers lay in the consumers' own hands to a much greater extent than it did in the hands of electricity supply authorities or the Government. It was only by consumers making greater use of the capital invested—by increasing their individual consumption of electricity—that any substantial reduction of cost could be brought about. The general scheme outlined in the Bill closely resembled that which had been developed by the company on the North-East Coast during the past 25 years. Its application to the country as a whole would raise many difficult problems. The high state of electrical development that had been reached on the North-East Coast had only been possible because those responsible had had absolute control over generation. In the Government scheme it was proposed to take away this control and place it in the hands of a board having executive powers. This appeared to be a substantial step towards nationalisation of all electrical energy produced by supply authorities. He was satisfied that if the Government's Bill was not amended and was passed into law in its present form, future development would be very seriously hampered. If a system of high-pressure transmission mains throughout the country was provided, he earnestly hoped that power companies would be allowed to retain control of generation within their own areas. That, in his opinion, would remove one of the strongest objections to the proposals contained in the Bill. The report and accounts were adopted.

Folkestone Electricity Supply Co., Ltd.

Presiding at the annual meeting on March 26th, the chairman (Alderman George Spurgen, J.P.) said that a satisfactory number of new consumers had been added during the year, and the demand had reached a record figure. The main part of the work of bringing the undertaking in line with the most modern practice, both as regarded generation and transmission, had been practically completed. It was hoped that before the next meeting the company's undertaking would be linked up with that of the Dover Corporation in accordance with the instructions of the Electricity Commission. The latter's sanction had been obtained to the installation of a further 3,000-kW set, and an order for that had been placed with the Brush Electrical Engineering Co., Ltd. The directors felt that the broad principle of the Government's Electricity Bill was a sound one, and should eventually lead to considerable economies. The chairman also mentioned the institution of a co-partnership system by which employés could become shareholders in the company. In conclusion he said that the future for the company appeared to be bright.

Midland Electric Corporation for Power Distribution, Ltd.

The annual meeting of this company, whose report was reviewed in our last issue (p. 510), was held on March 22nd. Mr. James Taylor, who presided, said that to meet capital commitments 70,000 new ordinary shares were being offered at par to existing shareholders, giving them a substantial bonus. The progress of the company could be gauged from the fact that the energy sold increased during the year from 48 to 55 million kWh. The demand for electricity continued to grow. Their station at Ocker Hill was fully loaded and not capable of further expansion; further supplies would have to be obtained from the West Midlands Joint Electricity Authority. It was to be hoped that that newly-constituted authority

would proceed at once with the provision of additional generating plant; strong representations had been made to the Electricity Commissioners on that matter. Referring to the Government's Electricity Bill, Mr. Taylor said that the directors were carefully considering its provisions, and while not desiring to do anything to obstruct the improvement of electricity supply in this country, were taking steps to protect the company's interests. A staff benefit fund had been created and a total of £16,954 (including £12,000 provided last year) was being handed over to the trustees of the fund. The report and accounts were adopted, and at a subsequent extraordinary meeting the institution of the staff benefit fund was approved.

West London and Provincial Supply Co., Ltd.

The annual meeting was held on March 24th under the chairmanship of Mr. Harry Kahn, who, in the course of his speech, referred to the death of two directors, Sir T. Brooke-Hitching and Mr. M. Hansell. Turning to the accounts, he said that the Chiswick Electricity Supply Corporation had declared a dividend of 16 per cent., as compared with 15 per cent. in 1924. The West London Company was paying the preference dividend and the directors recommended that 7½ per cent. should be paid on the ordinary shares, that £5,000 should be transferred to reserve, and that £2,379 should be carried forward. Proceeding, the chairman said that the company's holdings consisted almost entirely of its interest in the Chiswick Corporation. Now that the financial position had improved and they had been able to inaugurate a reserve fund, it was considered that their investments should be extended in other directions. The directors were accordingly drawing up a scheme which would improve the status of the company and consequently the shareholders' investment in it. They also aimed at dealing with the method of marketing the company's shares, and taking steps to place the company among the recognised trust companies of the City.

Pinchin, Johnson & Co., Ltd.

In the course of his speech at the annual meeting on March 23rd, the chairman (Mr. E. Robson) said that 1925 was a record year, although there was a slight drop in the net revenue, owing to the non-recurrence of certain items which appeared in the 1924 accounts. They had had to carry in the past year's accounts a fairly heavy depreciation on account of Continental exchanges, and in addition conditions in the Far East had militated against the obtaining of normal results in that particular market. All other sections of the business showed substantial increases in spite of the existing adverse conditions. Considerable progress had been made towards the completion of the new factory adjacent to their Silvertown works. That extension had considerably increased the company's efficiency. The outlook for the present year was a very encouraging one from many points of view, and the sales from January 1st onwards had been satisfactory. The report and accounts were adopted.

City of London Electric Lighting Co., Ltd.

An extraordinary general meeting was held on March 24th. Mr. J. B. Braithwaite, the chairman, explained that until an agreement had been arrived at with the London County Council, under the Act of 1925, a statement of accounts in the customary form would be of little value, and the shareholders would probably prefer to await a balance sheet showing the financial position of the company under the Act. The board was satisfied, however, that the profits for 1925 were sufficient to permit of the payment of the preference dividend and of a dividend at the rate of 15 per cent. upon the ordinary shares. This was approved by those present and at a subsequent meeting resolutions authorising the alteration of the articles of association were passed..

Automatic Telephone Mfg. Co., Ltd.

The directors' report for 1925, which we briefly mentioned in our last issue, shows a profit of £163,325 for the year, to which is added £15,755 brought forward, making £179,080. After meeting debenture interest, preference dividend, &c., and allocating £50,000 for depreciation and £20,000 to general reserve, there remains a balance of £87,408. A dividend of 10 per cent. is recommended and a balance of £37,804 is to be carried forward. Steady production on a large scale has been maintained throughout the year, causing a satisfactory increase in the profit earned and enabling the directors to make substantial allocations to reserve and depreciation. The outstanding £210,000 6½ per cent. debentures were repaid during the year. Meeting: April 7th.

German Companies.

The report of the *Robert Bosch Gesellschaft*, Stuttgart, makers of magnetos and electrical equipment for motor vehicles, shows a net profit for last year of £397,142, out of which a dividend of 8 per cent. is being paid on a capital of £1,500,000. This result has been achieved notwithstanding the fact that part of the works was on short time during the twelve months. It is stated that 80 per cent. of the output of magnetos is exported to other countries.

The *Concordia Electricity Company*, Dusseldorf, states that the expected improvement in business did not take place in 1925. After defraying general expenses the accounts show net profits of 239,000 marks, permitting of the payment of a dividend at the rate of 5 per cent.

The *German Telephone and Cable Industry Company*, Berlin, has declared a dividend at the rate of 6 per cent. for 1925. At the recent annual meeting it was mentioned that the invoiced turnover largely increased last year as well as the stock of orders. Business in the current year had so far been satisfactory, the further development depending upon what funds the authorities would have available for the extension of the telephone network and the conversion of the exchanges to the automatic system.

The *Electricity Supply Company*, Berlin, which owns or is indirectly interested in various undertakings, states that there was no diminution in the demand for energy in 1925, the falling off in some cases having been compensated for by new connections and increased use of plant in other instances. The net profits for 1925 amount to 2,080,000 marks, as against 1,750,000 marks in the previous year, the dividend being at the rate of 9 per cent., as compared with 8 per cent. in 1924.

The *Electricity Company* (*late Schuckert*), Nuremberg, reporting on the situation of the undertakings in which it is interested, states that a declining tendency was manifested in 1924-25 in the turnover of the manufacturing companies and the supply works and the traffic on the tramways, and the company's contracting and financing branches were inactive owing to the scarcity of capital. It was therefore necessary to restrict activity to the maintenance and development of the existing undertakings.

French Companies.

The *Société Française des Electrodes*, of Lyons, proposes to pay a dividend at the rate of 50 fr. per share for 1925 out of net profits of 1,638,000 fr., as compared with 1,686,000 fr. in 1924, when the same dividend was paid.

The *Compagnie du Bourbonnais* (*P. de Lachomette, Villiers et Cie.*), of Lyons, which has a share capital of 28,500,000 fr., reports net profits of 7,109,000 fr. for 1925 as against 6,032,000 fr. in the previous year. It is proposed to pay a dividend of 20 fr. per share.

La Société des Constructions Electriques de France, Paris, is increasing its capital to 100 million fr.

Swiss Company.—The *Oerlikon Accumulator Works Co.*, of Zurich, reports net profits of 700,000 fr. for 1925 as compared with 650,000 fr. in the previous year; the dividend is again 20 per cent.

Danish Company.—The *Copenhagen Telephone Co., Ltd.*, has proposed a dividend of 8 per cent. for 1925, as in previous years.

Chelsea Electricity Supply Co., Ltd.—Mr. W. R. Davies (chairman) presided at the annual meeting on March 24th, and in presenting the report and accounts (Elec. Rev., March 19th, p. 473) referred to the death of Major Woods, a director, and the appointment of Mr. P. D. Tuckett in his place. He said that the company had now come to the end of its period of independence. Although they had been able to pay a dividend of 12 per cent. for the past two years, the dividend during the 37 years of the company's existence had only averaged 5.2 per cent. The amount of the free reserves which could be capitalised and the standard price to consumers had not yet been fixed. They were anxious to have these matters settled as soon as possible to enable them to make a reduction of their charges, which should be substantial. They had decided, in the meantime, to reduce their maximum charge from 7d. to 6½d. per kWh.

Direct Spanish Telegraph Co., Ltd.—The report for 1925 states that the balance available, including the sum brought forward, amounts to £10,678. The 10 per cent. preference dividend absorbs £3,000; a dividend of 10 per cent., free of tax, is paid on the ordinary shares (£6,465); and a balance of £1,213 is carried forward. The traffic receipts showed a decrease of £8,824. During the year the company's Porthcurnow-Bilbao cable was interrupted for two days, and was repaired by the Telegraph Construction & Maintenance Co., Ltd. An issue of £100,000 4½ per cent. debentures was made, and the new cable was laid and opened for traffic on September 8th last. New overhead lines have been erected between the landing place, Arrigunaga, and Bilbao. Meeting: April 15th.

Hastings and District Electric Tramways Co., Ltd.—The annual meeting was held on March 23rd under the chairmanship of Mr. G. T. Moody. The chairman said that a substantial increase in the number of passengers had been accompanied by a decrease in the revenue. Fortunately the expenditure was lower, but the net result only enabled them to pay 2½ per cent. upon the ordinary shares—a totally inadequate return. The undertaking was heavily rated and further relieved the rates by the amount of road maintenance which it was forced to carry out. The Hastings Corporation had proposed to run competing transport services, but the proposal was rejected by the ratepayers. They regretted that their friendly attitude towards the Council had not been reciprocated.

Slough and Datchet Electric Supply Co., Ltd.—The report for the past year shows a profit of £21,261 (including £4,348 brought forward). After providing for depreciation, &c., it was proposed to pay a final dividend of 6 per cent. (making 10 per cent. for the year) together with a bonus of 4 per cent. The 15,000 new shares rank for dividend from January 1st, 1925, on 10s. per share, and from July 1st, 1925, on £1 per share. A balance of £6,150 is carried forward. The extension of the company's mains to Burnham has been attended with satisfactory results, and the company has applied for powers to extend its mains to Hitcham, Dorney, Boveney and Eton Wick.

Costa Rica Electric Light and Traction Co., Ltd.—The net earnings of the company in Costa Rica increased from £26,277 to £27,808 in 1925, but the net profit fell from £9,339 to £8,906. The board has entered upon considerable expenditure upon additional plant and renewals. Five new cars have been purchased and placed in commission, and a new 1,200-kW turbo-generator is being installed. These items will cost £30,000, and accordingly the directors have again placed the balance of net profit for the year to the depreciation and renewals account. The meeting was held on Wednesday last.

London Electric Wire Co. & Smiths, Ltd.—The directors' report for 1925 states that during the year the business of the company was restricted by trade depression, and a large proportion of the business was done at a very small margin of profit. The directors had made an addition of £25,000 to the special reserve account to provide against special contingencies. The preference dividend has been paid and the directors recommend a final dividend of 6¼ per cent. on the ordinary shares, making 7½ per cent. for the year, leaving £35,918 to be carried forward. The meeting was held on Wednesday last.

Stewarts & Lloyds, Ltd.—The annual meeting was held on March 26th. Mr. R. M. Wilson, who presided, said that last year proved to be one of the worst which the iron and steel trade had ever experienced; the competition at home and abroad became greater and showed no signs of decreasing. Indeed, it was likely to become worse. In spite of the adverse circumstances, however, the company had increased its sales. Two of the large works had been remodelled and brought up to date.

Windsor Electrical Installation Co., Ltd.—The profit for the past year (including £3,648 brought forward) was £17,553. After providing for depreciation, debenture interest, preference dividend, &c., there remains a balance of £11,308. It was proposed to pay a final dividend of 6 per cent. on the ordinary shares (making 10 per cent. for the year) and a bonus of 4 per cent., leaving £5,752 to be carried forward.

Greengate and Irwell Rubber Co., Ltd.—The net profit for the past year amounted to £80,186 and the addition of £22,719 brought forward gives an available balance of £102,905. It is proposed to pay a final dividend of 1s. 2d. per share, making 2s. per share (12½ per cent.) for the year, as against 2s. 3d. in 1924, to place £10,000 to reserve, and to carry forward £27,279.

Thames Valley Traction Co., Ltd.—The balance available for the past year's working, after adding £2,538 brought forward and transferring £668 to reserve, was £7,588. A dividend of 6 per cent. is being paid on the ordinary shares (against *nil* for 1924), and £3,088 is carried forward. The directors propose to increase the capital from £75,000 to £100,000.

Browett, Lindley & Co., Ltd.—The directors report that during 1925 it was found impossible to secure sufficient work for the shops, and although economies were effected, the net result was a deficiency of £16,692, which is only partly met by the balance of £3,581 brought forward. So far this year orders have been more plentiful, but prices are very low owing to competition.

Companies to be Struck off the Register.—The names of the undermentioned companies will be struck off the Register at the expiration of three months, unless cause is shown to the contrary:—

Amalgamated Radio-Telegraph Co., Ltd.
City Electric Welding Co. (Newcastle), Ltd.
Egyptian Power and Nitrogen Syndicate, Ltd.
Electrical Development and Finance Corporation, Ltd.

Stock Exchange Notices.—The undermentioned have been ordered to be officially quoted:—

Midland Counties Electric Supply Co.—250,000 ordinary shares of £1 each, fully paid, Nos. 1,000,001 to 1,250,000, and 250,000 six per cent. cumulative preference shares of £1 each, fully paid, Nos. 1,000,001 to 1,250,000.
Shawinigan Water and Power Co.—$1,179,600 capital stock.

Brown Bros., Ltd.—In the course of his speech at the annual meeting on March 26th, Mr. W. Dickison (chairman) said that a dividend of 7½ per cent. was recommended on the ordinary shares. The company's radio branch had proved a useful addition to its activities.

Scottish Tube Co., Ltd.—Out of a balance of £61,023 for 1925 (including £16,539 brought forward) the directors propose to pay a dividend of 4 per cent. on the ordinary shares and to carry forward £15,967.

Stocks and Shares.

Monday Evening.

The principal event this week in the world of electricity is, of course, the debate on the second reading of the Electricity (Supply) Bill, around which a lively degree of interest has become quickened. The Bill is forming now the focus of political discussion, and, having been put into the political window, it attracts thereby attention from people who in the ordinary way would have regarded the business as much too abstruse and technical for them to attempt to understand. Having been definitely stamped with the label of Socialism by one party and non-Socialism by another, the Bill suddenly assumes a position of first-class importance. The technical mind must be amused, the non-technician surmises, at some of the lay criticisms that are levelled from both sides.

From the purely Stock Exchange point of view, the effect of the hubbub is comparatively slight. The tendency is to let prices droop, but none of the London shares are affected. Proprietors are evidently content to await the course of developments, and to pin their expectation to the future rewarding them with the same dividends as they now receive. For this reason, the price-list is almost unchanged, though some of the provincial shares are a little weaker. Clyde Valleys have gone back to 28s. 6d., Midland Counties to 20s., and Yorkshire Electrics are dull at 25s. 6d. In the London list, Westminsters receded to 43s. 9d. and Edmundsons preference to 22s., but apart from these, no alterations have occurred.

Sharp advances are marked in Metropolitans and in Districts. The latter have jumped 3 points to 50, while Metropolitans are 1½ higher at 66½. London Electric ordinary at 47 is 2 up. The Central London stocks are a little better, but show no quotable changes. In the Underground group there has been a reaction after the material improvements of a week ago. The £10 shares lost 2s. 6d. out of their half-a-sovereign rise and Bus "A" shares eased off to 10s. The 6 per cent. income bonds are left at 100. To explain the rise in Districts it is pointed out that this railway is more intimately connected with the Undergound than is the Metropolitan, and that the benefits expected to accrue to the former through the acquisition by the L.G.O.C. of eight private omnibus concerns are likely to be reflected in the District's profits. Metropolitans pay a very fair yield on the money, considering the prospects that the company possesses of being absorbed into one of the other groups in the future. The rise in London Electric ordinary stock has come about as a result of a little inquiry upon a market in which it is very rarely that stock changes hands at all. Nothing fresh has occurred in the British Electric Traction or the London Tramway stocks.

Marconis have responded to the better tone (which we mentioned last week as being in evidence) by a rise to 23s. 9d., the improvement being due to the unexpectedly good showing made by the Marconi Marine, shares in which latter concern remain at £1. Other wireless shares keep steady. A statement has been issued by Pettigrew & Merriman, the price of whose ordinary shares, 5s. fully-paid, is no better than 2s. 6d. The 7½ per cent. preference, with 15s. paid, stand at 6s. The directors state that in spite of the acute depression in the wireless industry, which the company has had to share with all others, its finances give no cause for anxiety. They will cause interim accounts to be prepared up to the end of June next. The company started business as from the end of October last.

Automatic Telephones maintain their rise at 51s. 3d., and Internationals are steady at 44s. The London Electric Wire Company and Smiths announce a profit for last year of £72,500, a decrease on the previous 12 months of about £18,000. The dividend is maintained on the ordinary at 7½ per cent., and the price of the 7½ per cent. preference shares is 24s. The ordinary are not quoted.

Amongst the newly-issued stocks, London Power 5 per cent. debenture strengthened to 96½ bid, which is not surprising in view of the gilt-edged character of the security. South London Electric 5 per cent. debenture stock is better at 96, and most of the purely investment securities hold their prices. American Telephones went back to 150, and Radio Corporations come weak from New York, the common being no better than 7. The preferred keep about 9¼. Canadian Marconis are listless at 4s. 1½d. All the little interest that was aroused not long ago in the latter shares has evaporated; the price has come back, it will be observed, to about the level at which the recent offer of new capital was made.

Anglo-American deferred stock has recovered to 23¾, but the cable group as a whole is very quiet, and nothing of consequence has happened. Callenders dropped to 75s., to rally to 76s. 3d. British Aluminiums are better at 41s. 3d., and British Insulated hold their rise at 3¼. Siemens at 31s. 3d. have gone back a little. India Rubber shares at 23s. are 9d. down.

Anglo-Argentine Tramways shares are dull, the second preference in particular being weak at 2½. The company is said to be faced with severe 'bus competition, but, besides this, some doubt is expressed as to whether the reported arrangement reached between the Municipality of Buenos Aires and the Anglo-Argentine Tramways Company has been converted into a permanent agreement. It would be useful to hear an authoritative statement upon this point, in order to answer the uneasy questionings of shareholders who are disturbed at the dwindling of the share-prices. Brazilian Tractions are a little lower, and other parts of the traction market present no points of fresh interest.

The engineering section is a shade better, with trifling recoveries in some of the better class iron and steel shares. In the rubber share market activity is checked not only by the close approach of the Easter holidays, but also by the reaction which has taken place in the price of the raw material from 2s. 7d. a lb. to the neighbourhood of 2s. 5d. per lb. New issues from several of the companies connected with the electrical industry are declared by gossip to be in course of preparation. No important offers are likely to be announced until after Easter.

The British Association.—The British Association for the Advancement of Science has issued the preliminary programme for this year's meeting at Oxford. This contains information regarding accommodation, lists of officers, and a map and historical details of the city and university. The Prince of Wales will deliver his presidential address on August 4th, and the meeting will continue until August 11th. Some excellent excursions are being arranged to places of interest in the neighbourhood of the city. The meetings of Section G.—Engineering are to be held at the Electrical Laboratory. Sir John Snell, president of the section, will deliver an address on "Electricity Supply: Its Recent and Probable Future Development," on August 6th. The proceedings of the section will include a discussion on "Refrigeration."

A Stand-by Plant Test.—We have received some particulars of an interesting speed-service test which was recently carried out at the Winnipeg hydro-electric generating station in connection with its steam stand-by plant. Without warning to the stand-by crew the main switches were tripped and the water plant shut down, the pulverisers and conveyors for the steam installation automatically ceasing to function. At the sound of the shut-down siren the stand-by men ran up from the storage steam a 1,000-h.p. house turbine, and in 2¼ min. there was sufficient electrical energy developed to start feeding the boilers. The two 7,500-h.p. main stand-by turbines were then warmed up and in 26 min. from the time when the water plant was shut down the steam turbines were on load giving an adequate supply. It is interesting to note that the three steam machines were supplied by Messrs. James Howden & Co., Ltd., Glasgow.

The Electrical Exports of Germany.

With the publication of the monthly returns, for December and the twelve months of 1925, of the foreign trade of Germany, some interesting information regarding the progress of the electrical trade of the country can be ascertained. As, however, a number of alterations in the classification were made on October 1st, when the new Customs tariff came into operation, an exact comparison with the results of the previous year is not always possible. In the following table are shown the number of dynamos, motors, converters and transformers of certain specified weights exported during the first nine months of 1925 to the principal destinations, together with the total weight in double centner (= one-tenth of a metric ton) and the value in gold marks. Side by side are given similar figures for the whole of 1924.

	1924. (12 mos.)	1925. Jan.-Sept.
Dynamos, motors, converters and transformers up to 25 kg.	204,412	231,452
Weight (Double centner)	7,689	6,383
Value (Reichsmark)	5,211,000	4,815,000
To Great Britain	14,031	13,939
,, Italy	12,721	10,241
,, Holland	35,630	49,316
,, Austria	13,468	10,456
,, Switzerland	21,930	23,900
Ditto, 25 to 100 kg.	41,444	29,904
Weight (Double centner)	22,548	16,191
Value (Reichsmark)	5,343,000	4,148,000
To Holland	5,037	3,469
,, Argentina	3,182	3,653
,, Brazil	2,602	2,331
Ditto, 100 to 500 kg.	21,394	15,916
Weight (Double centner)	43,356	32,294
Value (Reichsmark)	9,235,000	6,857,000
To Italy	1,034	854
,, Holland	1,307	1,010
,, China	1,074	465
,, Brazil	3,041	2,667
Ditto, over 500 kg.	6,904	4,945
Weight (Double centner)	140,429	115,964
Value (Reichsmark)	20,598,000	18,366,000
To Italy	407	307
,, Holland	406	367
,, Spain	518	345
,, Japan	447	172
,, Brazil	599	415

Since October 1st, 1925, the records of this trade have been further sub-divided according to weight, the total exports from that date until the end of the year being as follows:—

	Number.	Weight. Do. c'tner.	Value. Gold mk.
Up to 10 kg.	76,569	1,484	1,564,000
10 kg. to 25 kg.	6.802	1,153	713,000
25 kg. to 150 kg.	12,217	8,462	2,145,000
150 kg. to 500 kg.	2,688	7,335	1,705,000
500 kg. to 3,000 kg.	1,593	16,941	3,246,000
Over 3,000 kg.	204	17,296	2,597,000

Holland, Austria, and Czecho-Slovakia figure prominently amongst the destinations of machines up to 150 kg. in weight; Italy, Argentina and Brazil are good customers for those from 25 to 3,000 kg., whilst of those over 3,000 kg. 24 went to Argentina, 20 to Italy, 18 to Norway, and 16 to Japan, during the period mentioned.

In regard to the following items a useful comparison can be made:—

	1924. (12 mos.)	1925. (12 mos.)	Inc. or dec.
Armatures and commutators (Double centner)	26,515	24,137	− 2,378

The National Register of Electrical Installation Contractors.

Report and Annual Meeting.

The report for the past year of the Executive Committee of the National Register of Electrical Installation Contractors commenced with an expression of regret at the death of Mr. L. G. Tate, whose efforts in its initiation and active assistance in furthering its aims and objects, had placed the institution under a deep obligation. The executive was advised that the Articles of Association would have to be amended, to enable registered contractors who were not members of any electrical trade organisation to appoint representatives on the Registration Board. The income and expenditure account did not show receipts in the same proportion as the previous year, as the fee for renewal was £1 only, whereas that for registration was £5, and new applications accepted totalled 163 as compared with 674, including duplicates for 1924. Assuming that the expenditure was on no greater scale than the year 1925, and that advertising and publicity expenditure were treated as special items, the annual expenditure was estimated to amount to approximately £1,000, leaving a deficit of approximately £100 to be made up by further registrations, which it was anticipated would be forthcoming during 1926.

Applications for registration up to December 31st, 1925, totalled 930, of which 804 were accepted and 50 were still under investigation and consideration; of the remainder 76 were declined for various reasons. Bringing these figures up to the date of the last meeting of the Executive, 1,018 applications had been received, 853 accepted and 84 declined, so that for the comparable year there was a net addition of 183 contractors to the Register. During the year there were 11 registrations which were not renewed owing to various causes. The Executive recommended the amendment of the rules to provide that branch establishments of a registered contractor might be registered for the payment of £1 and £1 annual renewal fee. The municipalities of Cheltenham and West Hartlepool, and the Newcastle-upon-Tyne Electric Supply Co., had joined the corporate bodies which were confining their orders to tenderers who were on the National Register. Inquiries which had been made encouraged the Executive to believe that Corporations were making considerable use of the National Register. Consultants and architects had also applied for information. During the year a Publicity Committee was appointed on which Mr. Beauchamp and the late Mr. Tate were co-opted to take up the question and to carry out a programme, and a complete list in book form of registered contractors was issued to station engineers, consultants, architects and builders to the number of some 15,000. The Royal Institute of British Architects, in pursuance of a settled policy, was withdrawing its representatives from all institutions including the Registration Board. An agreement was reached with the Commissioners of Inland Revenue that the renewal fees paid by Registered Contractors should be allowed as a trading expenditure in their accounts.

Eighty local Advisory Committees had now been constituted and were functioning smoothly. The following nominations to the Board were made by the respective nominating bodies: The Institution of Electrical Engineers, the Incorporated Municipal Electrical Association, the British Electrical and Allied Manufacturers' Association, the Association of Consulting Engineers, and the Illuminating Engineering Society, renominated their respective retiring representatives. The Electrical Contractors' Association of Scotland nominated Mr. R. A. Ure in the place of Mr. A. Lindsay. The Electrical Contractors' Association, the Electrical Wholesalers' Federation, the Irish Centre of the Institution of Electrical Engineers, and the Electricity Supply Association of Ireland, had not sent in their nominations up to the date of the report. Many inquiries had been made as to whether the National Register had adopted a set of wiring rules. Such was not the case, but it was probable that the subject would have to be considered by the Board in the future. A lengthy inquiry was made by the Executive into complaints against the work of a registered contractor carrying on business in a northern suburb of London, which were found to be justified and admitted by the contractor. The Committee had no other course open but to withdraw his certificate and strike his name off the Register. Notices of appeal from the Executive's refusal to register two applicants were received and an appeal was lodged against the Executive's refusal to approve a new qualifying manager of a registered contractor. The Executive invited discussion and such a decision on the subject as would lead to the most economical and speedy procedure being adopted.

The report concluded with special reference to the indefatigable services of the chairman, Mr. P. V. Hunter.

The annual meeting of the Registration Board was held at the Institution of Electrical Engineers on March 22nd, under the chairmanship of Mr. P. V. Hunter. After the adoption of the balance sheet and accounts, Mr. Shaw raised the question of the various Local Advisory Committees holding meetings in their areas for the purpose of obtaining further applications for registration, and a general discussion ensued. It was pointed out that the National Register considered that it could not canvass for applicants, but was prepared to grant registration to duly qualified applicants, and that the matter of increasing the number of registered contractors lay with the contractors themselves. The matter was left to the Executive Committee for further consideration and to make any recommendations which it might think fit to the contractors' associations concerned.

The nomination of Mr. Ure as the representative of the Electrical Contractors' Association of Scotland in the place of Mr. Alex. Lindsay was confirmed, and the retiring representatives of other bodies having been renominated were re-appointed. The retiring members of the Executive Committee, Messrs. Dykes, Cash, and Britton, were also re-appointed.

A lengthy discussion on the subject of the adoption of a set of wiring rules by the National Register was then entered into, in which Col. Crompton, Mr. Dykes, Mr. Shaw, Mr. Cash, and Mr. Gaster took part, and the difficulties in the way of so doing were fully pointed out. The general opinion was that the time was not yet opportune to take action in that direction, and the matter was left in the hands of the Executive to report to the Registration Board when action should appear desirable.

The Chairman explained the desirability of amending the rules affecting the registration of branch establishments and moved amendments, which were adopted. The chairman and the vice-chairman were unanimously re-appointed for the ensuing year. The question of hearing appeals from decisions of the Executive was discussed, and it was decided that a month's notice to members of the Registration Board other than those on the Executive Committee would be sufficient to secure the necessary number on the day fixed. A vote of thanks to the chairman concluded the proceedings of the meeting.

International Fair at Salonica.—*Reuter's Trade Service* learns that one of the principal aims of the International Fair to be held at Salonica from May 15th to May 31st is to give the trade and agricultural centres of Greece, particularly those of Macedonia, an opportunity of entering into closer and more frequent business relations with European manufacturers. The articles to be exhibited at the Fair include electrical apparatus, dynamos, motors, transformers, lighting and heating equipment, &c. Further particulars and application forms can be obtained from any Greek Consulate in Great Britain or the Fair's hon. representative in England, Mr. G. Loutsis, Commercial Secretary, 51, Upper Brook Street, W.1.

Municipal Electrical Service.

The Colwyn Bay and Doncaster Bills and Local Contractors.

(*Concluded from page 519*).

The Colwyn Bay Case—(*continued*).

Mr. F. C. Raphael (consulting engineer) gave evidence on behalf of the contractors. Originally, he said, a number of undertakers had obtained full selling powers, but in 1904 the Electrical Contractors' Association was formed and had opposed a number of Bills, with the result that time after time special conditions were inserted to the effect that the powers granted could only be exercised through a contractor. The Electricity (Supply) Act, 1919, did not give those powers to local authorities, whilst in a later contest the Wakefield Corporation had been refused these powers by the House of Lords. Side by side with the Parliamentary fight there had been an action in the Law Courts, when the Leicester and Sheffield Corporations lost their cases. He also quoted from the Annual Report of the Electricity Commissioners published in 1923, where it was stated that in granting Special Orders it was the general policy of the Commmissioners not to confer any powers with regard to electrical fittings beyond those conferred on joint electricity and local authority undertakers by Section 23 of the Act of 1919, and that any departure from that policy could only be considered in cases where strong and exceptional reasons were given. Witness could not recollect any cases which had been fought since 1904 in which full powers had been given, except that of the London County Council General Powers Act, until last year, when selling powers were given to the Bath, Burnley and Barrow Corporations. In those cases the main reason put forward was that it was desired to wire poorer class houses on a free-wiring or hire-purchase system, and he was strongly in favour of that. It was not necessary, however, in order to carry out that scheme, that the local authority should do the wiring. He saw no object in local authorities starting wiring departments, which was a new business entirely. They had already contracting firms who could carry out the work and naturally they had to invest their capital for those installations if they were going to sell them on the hire-purchase system. The amount of capital that they invested would be no more if they employed a contractor to do the work than if they did it themselves; in fact, it might conceivably be very much less because they had to build up their wiring business first. By having contractors in the district they had the advantage of the canvassing done by the contractors and further, there was always better canvassing where there was competition than in the case of a monopoly. Reference was then made to cases where wiring was carried out on hire-purchase terms through contractors, though the local authorities concerned did not possess or had not put into force wiring powers. In the case of South Shields the contractors' canvassers were provided with a form of hiring agreement, they were paid on commission by the contractors, and the contractors who secured the orders were given the order for the wiring, which was carried out on an agreed schedule and financed by the Corporation. Within six months of the inception of that scheme there were 7,477 applications for supply. Within seven months the number of private houses connected to the supply had increased by 86 per cent. Mr. Raphael said that all the wiring was carried out in comparatively small property. There was nothing to prevent the Colwyn Bay Council from carrying out a similar scheme if it chose to do so without further powers. The St. Marylebone Borough Council, though it had full powers, did not use them, but had an assisted wiring scheme. Applications for wiring were submitted to contractors for tender, the most suitable being accepted. In the 18 months from the time the scheme was started until November last, 177 radiators and 128 cookers had been connected in one block of artisan dwellings only, containing 540 flats, and the total energy consumed was estimated to be 238,894 kWh. At Walthamstow, where full wiring powers were possessed, the local authority had had an assisted scheme since 1922. It did not have a fixed rate for rentals, but obtained quotations for the work from contractors and worked out the rentals from those. The consumers chose their lamps and shades at the local authority's showroom and bought them from the contractors. Other hire-purchase schemes referred to, in which the work was done by the contractors, were those of Tamworth and Gillingham, Kent.

The Chairman asked whether it did not come to this, that so long as the contractors were reasonable the corporations would employ them to do the work, whether they had powers or not. Mr Raphael replied that that would be the reasonable course, but there were cases where there were very pushful municipal engineers who would exercise their powers and drive the contractors out of business. The Chairman asked if there were no contractors who were unreasonable.

In further evidence, the witness said there was no guarantee that a wiring department run by a local authority would be self-supporting. He had examined the accounts of a number of undertakings who had these powers and it was impossible to ascertain whether the wiring departments were carried on at a loss or at a profit. He also stated that as a rule local authorities had no experience of wiring, whereas on the whole the contractor knew his business very well and did it very well. If the Colwyn Bay Council started wiring it would be in the position, as the supply authority, to condemn the wiring carried out by contractors; also the consumer who received tenders for wiring from the Council as well as from contractors would, in nine cases out of ten, accept the Council's tender on the pure question of standing. As to the allegations of bad wiring at Colwyn Bay, he gathered from the evidence that with the exception of one or two cases, they were matters of very small detail. Cross-examining, Mr. Rowand Harker said that witness suggested that the scheme was one by which the Council should be liable to the contractor for the full amount of the bill and that the ratepayers should finance the local contractors who were unable to finance themselves. Witness agreed that the Council should pay for the wiring; it would finance not the contractors but the hire-purchase scheme. Mr. Harker said that if the hire-purchaser did not meet his obligations the ratepayers would bear the loss incurred. Witness replied that there should be no loss because the Corporation could collect the fittings. He agreed that the wiring would be of little value unless taken over by the next tenant, but there had been very few failures in that respect. Mr. Harker asked if it were suggested that if the Council obtained these powers it would deliberately run the wiring department at a loss in order to drive the independent contractors out of business. Witness replied the Council would not do it for that purpose but any municipal department which started a business and could not run it at a profit would continue to run it at a loss. Mr. Harker pointed out that the clause in the present Bill made it clear that work carried out under the powers asked for should be self-supporting, whilst another clause imposed upon the Council the obligation to keep separate accounts for each undertaking and laid down exactly how moneys were to be applied.

Referring to the report of the Electricity Commissioners, Counsel asked whether it was not the case that the Commissioners took the view that when simply asked to "extend" existing powers they had no jurisdiction to grant such powers as the Council was now asking for. Witness replied that the Commissioners' view was that they had no jurisdiction to grant any powers at all beyond those referred to in Section 23 of the 1919 Act.

Mr. T. E. Alger (President of the E.C.A.) was the final witness, and was giving evidence as to why competition by local authorities was ruinous to contractors, when Mr. Turner (representing the Colwyn Bay Council) interposed with the remark that the Association was not petitioning in this case but that the petitioners were individual contractors in Colwyn Bay. In his cross-examination, Mr. Turner, having ascertained that there were eight members of the Association in Colwyn Bay, suggested that they had joined in large numbers recently in view of the present proceedings. Witness, however, disagreed and said he did not think any had joined within the last six months, although he was not sure about that. Those eight members would represent 90 per cent. of the competent electrical contractors in Colwyn Bay and they were admitted to membership by examination.

This concluded the evidence, it being stated by Mr. Drucquer that he had other witnesses, but as their evidence did not refer specially to Colwyn Bay he would not call them, in view of the Chairman's request that the evidence should deal as far as possible with the conditions there.

Mr. Drucquer, addressing the Committee on behalf of the contractors, said he fully realised the difficulty which he had to face in that last year a Committee of the House of Lords, after carefully considering the matter, had decided to grant the powers now asked for to the Bath, Burnley and Barrow Corporations. He asked the Committee, however, to deal with the matter now upon the special grounds relating to Colwyn Bay. There was no doubt at all that in the case of the three Bills referred to the matter was, to a very great extent, decided upon principle. He did not dispute that, prior to 1904 when the E.C.A. was formed, some 71 local authorities had obtained the powers now asked for, because nobody had opposed or had thought about them, but from 1904 to 1919 the Association had opposed successfully in all cases except that of the L.C.C. General Powers Act, and had succeeded in getting the powers refused or a special clause inserted which provided that the work should be done through contractors. There could be no doubt, therefore, that the policy of Parliament, and especially of the House of Lords, was that it was inimical to the interests of the country that this retail trade should be carried on by local authorities against the contractors. That policy was also reflected in general Acts of Parliament. In the Electric Lighting (Clauses) Act, 1909, an attempt was made to insert those powers, but it was unsuccessful; the Electricity (Supply) Act of 1919 did not give the powers, but made it necessary for a local authority to show a special case before they could be granted. The powers were also refused in other private Bills. Dealing with the events leading up to the granting of these powers in the Bath, Burnley, and Barrow Bills last year, he said that the Institution of Municipal Engineers had written to the Lord Chairman pointing out for the first time, so far as counsel was aware, that there was a very strong case for giving those powers, because, unless they were granted, it would be impossible to

supply electricity to a very large number of the poorer classes, who could not afford to pay the initial cost of wiring. In consequence of that, a Committee was appointed specially to inquire into it. The evidence before that Committee was such that he could scarcely see how it could have reached any other decision than to grant the powers, because it had had simply a strong body of evidence to the effect that the powers were necessary in order to wire working-class houses. Had that Special Committee known that free-wiring or hire-purchase wiring could be done and was being done very successfully by a number of local authorities throughout the country, whether or not they had those powers, that change of mind of which Lord Strachie had spoken would not have occurred.

Continuing his address on March 19th, Mr. Drucquer referred to the case made by the Council that it was absurd for it to go to the expense of providing a showroom and not be allowed to sell fittings in it. His answer to that was that the cost would be very small, as the fittings shown would be supplied by manufacturers or contractors who would be pleased to supply them. It would be dangerous for a local authority supply undertaking to carry on selling, and in Manchester it was appreciated that it was not safe to run a separate trading undertaking owing to the danger of being unable to cover properly the risk of loss, but a showroom was maintained. As to the suggestion that it was unreasonable to expect the local authority to pay for wiring and fittings supplied on the hire-purchase system and for the contractors to take the profit, he pointed out that the local authority would have to pay whether it carried out the wiring itself or through the electrical contractors, and it would then receive payment by instalments. On the other hand, by doing the work through contractors, it had a body of men who, by reason of competition among themselves, were certain to do their best to obtain new consumers.

Another ground on which it was urged that the powers should be granted was that it was fairer when consumers who had hired cookers and other big appliances wished to buy them, that the Council should have power to sell. In this case, however, the Council had never made any attempt to let these appliances; it had not let a single cooker. Even so, the main point about letting cookers was that it increased the consumption of electricity. It had also been suggested that when cookers were no longer required, the Council could do nothing but scrap them. There was no evidence, however, that that was so; such cookers could be burnished up and hired out again. The allegation as to bad workmanship in Colwyn Bay was a very slender reason indeed for putting forward the present case. There were cases of bad workmanship all over the country, and there was no special reason for saying that the contractors of Colwyn Bay as a body were not fit to carry out the work. If there was ever a case which showed an absence of all enterprise, it was this particular case. In the witnesses' own admission the undertaking was in a very serious state. Its supply was equivalent to 33 kWh per head of population, and it was due to the lack of initiative. Blackpool had been referred to as a successful undertaking, but Blackpool had not the powers now asked for, and was comparable in every respect with Colwyn Bay, except that in the one case there was real initiative, whilst in the other there was none. A retail trade of the description referred to needed initiative, and if the Council had not that initiative that was one of the principal reasons why the powers should not be granted in this case. The Council had done nothing to increase the number of consumers, except in the case of new houses, and the supply in those cases was probably given as the result of applications by the householders themselves. Finally, having regard to the fact that the Lord Chairman hoped that a Joint Committee would be appointed at an early date to settle once and for all by statutory enactment what should be the powers granted to local authorities, he asked that the powers should not be granted until that Special Committee had been appointed.

The Chairman said that the Committee was unanimously of opinion that it was not necessary for counsel for the promoters to address the Committee, the decision being in favour of the granting of the powers.

The Doncaster Corporation Bill.

A Select Committee of the House of Commons considered Clauses 43 and 44 of the Doncaster Corporation Bill on March 22nd and subsequent days. These clauses asked for full wiring and hiring and selling powers in respect of electrical fittings, and powers to maintain showrooms. The proceedings were largely a repetition of those before the House of Lords Committee which considered the Colwyn Bay Bill. The same Counsel appeared as in the Colwyn Bay Bill, *viz.*, Mr. Tyldesley Jones, K.C., Mr. Harker, K.C., and Mr. Wrottesley, K.C., for the Doncaster Corporation, and Mr. Craig Henderson, K.C., and Mr. Drucquers for the electrical contractors, who again opposed.

Mr. Tyldesley Jones, in the course of his address on behalf of the Corporation, said that the principle that local authorities should supply electricity had been established and it was only logical that these authorities should be able to wire premises and hire and sell apparatus in the same way that electricity supply companies and gas companies could. As a matter of fact, the Doncaster Corporation owned the gas undertaking in the town and had all these powers in respect of gas. The development of electricity supply would be greatly speeded up if the Corporation had the powers; there were difficulties in the way of contractors wiring houses on the hire-purchase system or letting out apparatus on hire. The clause provided that the wiring business should not be carried on at a loss. Referring to the report of Lord Weir's Committee, Counsel called attention to the statement that the restriction on municipalities with regard to the supply of electrical fittings, &c., did not exist in America and ought to be removed in this country. It was true that no clause to this effect appeared in the Government Bill, but the Committee had made a very clear statement of its view on the matter. The Electricity Commissioners had drawn attention to the powers granted under Section 23 of the Electricity Supply Act, 1919, which permitted local authorities to hire out fittings but not to sell them, and had stated that no doubt the Committee would require the Corporation to justify the wider powers now being asked for. Counsel urged that full powers should be granted to municipalities unless very good reasons could be brought to the contrary.

Mr. S. R. Windle, borough electrical engineer, Doncaster, said that there were 12,000 premises in the borough, of which only 4,000 were connected to the electricity supply mains. The reason was that the tenants of smaller houses could not afford the expenditure involved in wiring their houses and the landlords would not do it. He was constantly finding people who had electricity for lighting and wanted apparatus such as cookers, vacuum cleaners, &c., but the cost of these was too high unless they were hired or let out on a hire-purchase system. At present the cost of wiring for lighting purposes in Doncaster was from 20s. to 25s. per point and considerably more than that for power purposes. He would be willing to co-operate with contractors to develop the supply in the borough but he could not say what the policy of his Committee would be in that respect. He would not agree that the contractors would be badly hit if the Corporation came in as a competitor, because under the scheme of development contemplated, new consumers would be obtained who would never come on to the mains under the present system. Broadly, the desire of the Corporation was to be able to deal with the customer right through into his premises and to give real service in connection with electricity supply.

On March 23rd, Mr. Windle, in answer to questions by Mr. Craig Henderson, for the electrical contractors, denied that the Corporation had been slack in developing the electricity supply undertaking. The Corporation had not put the powers to hire, under the Electricity Supply Act of 1919, into force because those powers were not considered sufficiently comprehensive. Moreover, it was not considered practicable to hire out electric cookers without giving the customer an option to buy. He regarded easy payment terms of purchase as a very important factor. He agreed that the Corporation had never tried to hire out cookers nor had it prepared a tariff of charges for hiring.

Mr. H. M. Marshall, a member of the Electricity and Housing Committees, said that 52,000 people in Doncaster out of a total of 55,000, were living in houses having a rental of less than 10s. per week and it was in order to deal with those that the wiring and fittings clauses were asked for. In the ordinary way, assuming the contractors offered a reasonable schedule of prices, the work would be done through contractors and not direct, but without the power on the part of the Corporation to do the work direct it would be in the hands of the contractors. There had been an instance of that in connection with a housing scheme when four contractors quoted exactly the same price, *viz.*, £612 for wiring 42 houses. The Corporation and the Government Housing Inspector thought the price too high and the work was not carried out.

Mr. Henderson expressed strong doubts whether the tenants of such small property as had been referred to, would really improve the landlords' property, by wiring it at their own expense.

Mr. Matthews said that the position of the contractors in the event of the powers being granted, had been seriously discussed by the Electricity Committee and everything possible would be done to co-operate with them and prevent any injury to them, if the contractors would assist.

Mr. F. W. Purse (borough electrical engineer, West Ham) said that West Ham had had full wiring powers since 1898 and did most of the work directly, although there was a certain amount done by contractors. He agreed that the number of contractors in the borough was now very small and that there was not one registered contractor there. He did not think the Doncaster contractors would be injured by the present proposals, so far as sales of fittings were concerned. The Corporation would be handicapped if it could not sell fittings in the showrooms.

Asked about the South Shields wiring scheme, which was being carried on through contractors, Mr. Purse replied that although the scheme had been a success, it was not one which he would recommend his Committee to adopt. It was nothing more than a disguised hire-purchase system, carried out through contractors, and if anyone cared to take action it seemed to him that an injunction could be obtained against the Corporation. Asked as to his own wiring and fittings department, Mr. Purse replied that a balance had been shown on the right side ever since it was started, allowance being made for interest on capital and depreciation. This closed the case for the promoters with regard to the wiring clauses.

The first witness for the contractors in opposition to the clauses was Mr. Walter Finlay, secretary of the Electrical Contractors' Association of Scotland, who emphasised the point that the Edinburgh Corporation had no powers to sell fittings and did all its wiring and fitting through contractors, whilst the Glasgow Corporation, which had powers to sell as

well as to hire, also did all its work through contractors in a most satisfactory manner. As to the demand for the hire-purchase of electric cookers, he said the sensible man would hire in order to safeguard himself against obsolescence. He objected to the Doncaster Corporation having selling powers because the customers might get the impression that their work would be better and more expeditiously done by the Corporation than by contractors, whereas it was not so.

Mr. Finlay said he had no doubt that the clause was all right in theory from the paying point of view, but in practice it did not always work out, and Corporations did not always conform to the strict letter of the clause. If no one took action then a loss might very well be incurred; it had happened in Scotland.

On the question of wiring small houses, Mr. Finlay said that once the Rent Restriction Act was done away with, he believed landlords would be inclined to have their houses wired, even when they were quite small, but he admitted that the Scottish wiring contractors had not advertised offering to undertake wiring on the hire-purchase system, although he believed that it had been done by private arrangement. Replying to questions concerning the necessity to inform the supply authority of a possible customer, Mr. Finlay said it was necessary to find out where the cut-out would be and it would be impossible to avoid giving away the name of the customer to the Department, and that was undesirable when the Department was also a competitor.

Mr. Thomas Alger (President of the Electrical Contractors' Association) said that that Association had a membership of 1,250, representing 90 per cent. of the firms in the trade. It was impossible for contractors to exist in a district where the Corporation had the powers asked for and did the work itself. At West Ham, for instance, there were no electrical contractors of any importance. A short time ago, the Hackney Council followed the policy of West Ham and there were no electrical contractors in the borough but since that policy had been changed, there were good class contractors there, and they were now doing the work for the Borough Council. Something like 20 or 30 contractors could get a living in West Ham if it were not for the policy of the Corporation. Questioned as to the position of contractors concerning hire-purchase arrangements, Mr. Alger said this matter was under the serious consideration of the contractors in conjunction with the manufacturers and he hoped that something would be done before long. If, however, full wiring powers were to be given to local authorities, the effect would ultimately be the same as had happened in the gas industry. Owing to the work being done by the gas supply authorities there was hardly an ordinary gas fitter left in business in the country. The contractors and the manufacturers in an endeavour to work out a hire-purchase scheme for wiring and fittings, had seriously discussed the matter during the past twelve months.

Mr. E. Brett, a Doncaster electrical contractor, and one of the contractors who put in the price of £612 referred to earlier in the proceedings, said he had had no communication whatever with the other three firms who quoted precisely the same price, and it came as a surprise to him to know that they were identical. It rather emphasised the keenness of the competition among the contractors of Doncaster. The Corporation went outside the borough for a later contract and gave it to a man who so undercut that he went bankrupt before he could complete the contract. Witness had not advertised his willingness to undertake wiring on the hire-purchase system, but he had done work and allowed payment to stand over for a while.

Mr. G. E. Shipe, another Doncaster electrical contractor, was also called and the Committee adjourned until March 24th, when counsel delivered their final speeches.

Mr. Craig Henderson, K.C., for the contractors, referred to a number of local authorities, with and without selling powers, which were carrying on business successfully by co-operation with contractors. He contended that Section 23 of the Electricity Supply Act of 1919 did not give wiring powers to local authorities which had not been authorised under a special Act or Order. He appealed to the Committee to leave the general law on the subject as it was at present, pending a general discussion of the whole subject, which would settle the difficulty once for all. Perhaps the best way to do that would be for the municipal authorities to seek to insert a similar clause to Clause 43 of the Doncaster Bill, in the Government's Electricity Supply Bill when it was discussed in the House of Commons, and so get a final decision which would become the general legislation for the country. In conclusion, he said that it the Corporation was merely asking for powers to deal with wiring under hire-purchase arrangements, the work of installation to be done by contractors, the contractors would not have opposed.

Mr. Rowand Harker, on behalf of the Corporation, said that it was the intention, if the Committee allowed Clauses 23 and 44 to work through contractors if the contractors made it possible by offering reasonable schedules of prices.

The Chairman inquired whether the Doncaster Corporation Gas Department had powers to sell gas fittings, and was informed that those powers existed but were not exercised.

The Chairman, in announcing the Committee's decision, said that Clauses 43 and 44 would be granted subject to the insertion of a provision that the wiring of premises must be carried out only through contractors.

A Survey of Industrial Relations.

Wages and Conditions.

This is the title of the second report* by the Committee on Industry and Trade, under the chairmanship of Sir Arthur Balfour, K.B.E.† In an introductory summary and review the Committee has digested a vast amount of authoritative information relating to wages, hours, and conditions in industry. The Committee emphasises the fact that the volume is purely descriptive and it does not make definite recommendations for action.

Having explained that the proportion of the population which follows definite occupations has remained fairly constant during the last forty years, the Committee draws attention to the decrease between 1881 and 1921 in the numbers and percentage employed in agriculture, *viz.*, from 1,500,000 (12 per cent.) to 1,300,000 (7 per cent.) and the great increases in coal mining, from 500,000 (4 per cent.) to 1,300,000 (7 per cent.); and in the metal and engineering group of trades, from 900,000 (7 per cent.) to nearly 2,500,000 (13 per cent.).

The Committee then proceeds to discuss the subject of wages. Having mentioned that the Board of Trade Index Number of wages showed a rise of about 13 or 14 per cent. in the twenty years preceding the war, it examines the level of rates of money wages in 1924 and 1925 as compared with 1914 and states that on the whole this rise may be taken to average between 70 and 75 per cent. over industry as a whole. The conclusion is reached that the prevailing rates of increase of weekly rates of money wages in the most exposed trades range from 45 to 75 per cent., with an average of about 60, while for the trades sometimes described as "sheltered" the increases range from 80 to 120 per cent., with an average of about 100. The average "real" rates of wages have remained roughly unchanged. The Committee further finds that in industries in which time rates of wages prevail, skilled workers fully employed in industries directly exposed to foreign competition are on the average less well off than before the war, while, on the other hand, unskilled workers generally, and workers in the so-called "sheltered" industries, have, generally speaking, improved their position. The Committee points out that in any trades in which piece-work has become materially more prevalent since 1914, the true average rise in weekly earnings will be somewhat greater than the recorded rise in time rates. On the question of wages in other countries, the Committee emphasises the difficulties surrounding the subject but quotes such official figures as are available for comparing the purchasing power of wages in London and various other capital cities. With certain qualifications, it may be said that the figures for June, 1924, indicate that in New York and Ottawa the purchasing power of an hour's wages in terms of food was roughly double that in London, while at the other end of the scale were Rome and Vienna with purchasing power less than half that of London. The figures for Paris and Berlin were each about two-thirds, and that for Brussels about three-fifths, of the London figure.

The Committee says that there are indications that payment by results has probably been gaining somewhat on payment by time, and describes certain special methods of industrial remuneration such as profit-sharing and family allowances, in certain foreign countries.

The Committee estimates that in 1914 the average weekly hours of industry were between 53 and 54 and that they have been reduced now to an average of about 48. In pre-war years, while wage movements were subject to periodic fluctuations, there was a continuous tendency towards the shortening of the working day. There has been little general change since 1914 in the ratio between overtime and ordinary rates of pay, or in the overtime conditions generally prevailing. The movement towards reduced hours of labour in Great Britain is only part of the movement in the same direction throughout a great part of the world, and mention is made of the legislation enacted in a large number of countries for the establishment of maximum hours of labour, usually, in principle, eight a day, or 48 a week. It is pointed out that this legislation differs very materially and is very elastic.

Passing from questions of remuneration and hours of labour, the Committee proceeds to discuss a group of miscellaneous matters concerning working conditions. The question of industrial fatigue is dealt with and the Committee points out that in given industries an optimum limit of hours in relation to production per hour and per shift can probably be determined. The Committee expresses the view that the researches on this and cognate points by the Industrial Fatigue Research Board may be expected to have important bearings on indus

* The first report was published in July last (Elec. Rev., July 24th, p. 151), and took the form of a survey of overseas markets.

† Stationery Office, 5s. net.

trial efficiency, and refers to the improvements in the amenities of workshop life and in industrial relations, and the increased continuity of personnel and productive efficiency which have already taken place and may be expected to result in increasing measure from the development of welfare work through the voluntary action of employers and the encouragement of Joint Industrial Councils and the Industrial Welfare Society. Mention is made of the increasing attention which welfare activity is receiving in the other principal industrial countries. On the subject of time lost in industry through various causes, the Committee points out that time lost through sickness in the three years 1921-4 was very much less than that lost through unemployment, while the time lost through the latter cause was also many times greater than that lost by persons engaged in trade disputes. Attention is also drawn to the loss of time in certain important industries, *e.g.*, the engineering, shipbuilding and building trades due to disputes between different bodies of skilled workmen as to their right to perform a particular branch of work. During the four years 1921 to 1924, an average of 74 million man weeks of potential work were lost owing to unemployment alone, the figure in the worst year, 1921, being as high as 93 million. It is found that unemployment has been higher in the group of exporting trades than in industry in general. The main groups of industries which have lately been most severely depressed are those connected with or dependent upon shipping or iron and steel. The readjustment of personnel and plant to peace requirements is still incomplete in some of these industries. On the other hand, most trades connected with house construction showed rates of unemployment well below the average, and the same is true of the printing and paper trades, public utility services (gas, water and electricity supply, railway, tram and omnibus services, &c.), and the distributive trades. The total number of persons in employment in Great Britain is fully as great as immediately before the war, the increased margin of unemployed being at least balanced by the increase of the employed population. An investigation made by the Ministry of Labour showed, *inter alia*, that 63 per cent. of the males and 77 per cent. of the females in the sample 10,000 individuals examined would in normal times usually be in steady employment. As to unemployment in other countries, two tendencies appear to be indicated, *viz.*, that in the period immediately before the war the percentage of industrial workers totally unemployed in Germany was probably lower and the range of its variation narrower than in Great Britain, and that while a collapse of employment occurred in the United States in 1920-21, at the same time as that in Great Britain, the recovery was much more rapid in that country than here.

The Committee includes its review with a discussion of the machinery in existence for industrial negotiation. It draws attention to the growth of collective bargaining, the result of which is a widespread system of regulating working conditions by means of national agreements reached by the parties themselves. The two main tendencies to which the committee calls attention are the essentially voluntary nature of British practice, and the differences which exist in the machinery evolved in the various trades to correspond to the great variety of conditions and needs of the individual industries themselves. The Committee considers that probably far fewer disputes to-day arise out of mere misunderstanding than was the case prior to the war. The Committee gives a summary of the legislation in existence in the Dominions and in foreign countries for the prevention and settlement of industrial disputes. It is explained that while many countries have relied on purely voluntary methods, a number of experiments in the utilisation of compulsion in one form or another have been made. The Committee selects the experiences of Australia, New Zealand and Canada as the most instructive, and explains the systems of compulsory awards, prohibition of strikes and compulsory investigation of disputes in existence in each of these Dominions. The experiences of Australia and New Zealand suggest that where compulsion is present conciliation in the true sense will be neglected.

High-Power Fusible Cut-Outs.

Some Factors which Influence their Rupturing Capacity, and Research Developments.

By L. C. GRANT, A.M.I.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

Hitherto fuses have been used to control only small amounts of power; in this section of the subject no real problem is involved, but when the power source is large the simple fuse in its various arrangements becomes unequal to the duty. Power station auxiliaries are usually supplied from a transformer bank of the order of 2,000 kVA, which could feed perhaps 50,000 kVA into a fault. This immediately emphasises an important difference between the duty required of a fuse and a circuit breaker, for a properly designed fuse operates so rapidly that the peak current and the effect of asymmetry must be taken into account in estimating the kVA to be ruptured. Distribution network transformers are usually fed from a high-pressure system of considerable capacity which would thus be capable of maintaining the full potential on the primary of the transformer under almost any condition. The use of pressures, nor was there a reliable fuse suitable for the protection of potential transformers and similar duty. A heavy current medium-voltage fuse is one important requirement for switchboard and similar work, and a good high-pressure fuse is equally desirable. Even at the present time there are few fuses which could clear a short-circuit properly, yet this is an essential duty if safe and consistent design is to be a characteristic of any scheme. Many of the claims made for fusible cut-outs could not be substantiated, and the general impression obtained from the tests was that most manufacturers were not correctly visualising the problem.

The author has endeavoured to confine his attention to the rupturing capacity and the problems having a direct bearing upon it. Between the time a new fuse element is fitted and the time it may operate, the setting is gradually altering

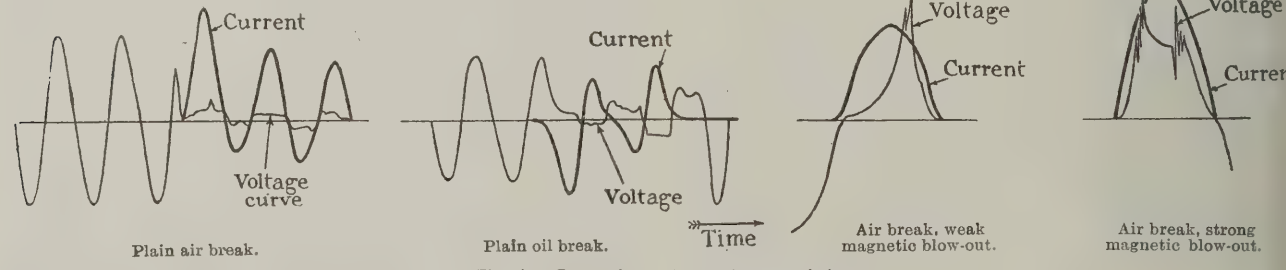

Fig. 1.—Comparison of Arc Characteristics.

circuit breakers would entail considerable expenditure, and if good fuses can be used in their stead it is an unquestionable economy to do so.

A point in favour of the fuse in preference to a circuit breaker is that more consistent protection can thus be obtained. Many distributors, installations, and apparatus are controlled by fuses, and the characteristics of the plant connected are essentially thermal. Therefore, any main circuit-breaking device should preferably have a characteristic time-current curve similar to that of a fuse. The author has not found for this duty any suitable device, other than a fusible cut-out, which consistently reproduces a thermal time-current curve.

Attention was at first concentrated on finding the limitations of and, if possible, devising improvements in existing designs. Afterwards, changes in design were made with a view to eliminating the known troubles At the time this work was commenced, the author could not find any fuse capable of rupturing, with reliability, large currents at moderate or high The time-current curve is therefore difficult to control and almost impossible to maintain with consistency. Deterioration also takes place through mechanical vibration, through innumerable changes in temperature due to load variations, air draughts and other causes, and through electrically induced vibration. The simple fuse will rupture large powers, but that is not the only problem; it must clear the fault without a dangerous explosion and without arcing over to neighbouring parts. Failure under these tests has proved the impossibility of producing a good cut-out of this class. In practice it has been found necessary to limit the continuous full-load current to between one-third and one-half of the minimum fusing current, otherwise cumulative oxidation will be set up. When the oxide film breaks down at a temperature near to the fusing temperature of the metal, as with copper, the process of rupturing is not affected to any marked extent by the presence of the oxide; but with such metals as tin, aluminium and zinc, the oxides are capable of holding up the molten metal after the current has raised the fusible element to it

melting point. With open elements of small size the oxide skin not only increases the rated minimum fusing current, but exerts upon the fusible element a variable effect which cannot be predetermined.

The section of the fusible element plays a part in limiting the current on short-circuit, but the effect is due not so much to the resistance of the element as to the point in the growth of the short-circuit current at which the element melts. In other words, it is possible to prevent the current rising to its full short-circuit value by using a rapidly-acting fusible element. For this, as well as other reasons, it is important to reduce the amount of metal in the element to a minimum, but the limit is set by the risk of introducing oxidation. On a 6,000-volt system with a maximum short-circuit power of 70,000 kVA a 100-ampere fuse of careless construction will pass practically the full short-circuit power before it clears, but if the ratio of fusing current to load current is reduced to the lowest practicable value of 1.2 : 1, a limiting effect will be exerted and the short-circuit power to be ruptured will be of the order of 6,000 kVA.

It is possible to reduce the ratio on a simple fuse to some extent by extreme care in the design of the carrier, by paying attention to cooling and so on; but for best results it appears to be necessary to make radical departures in the design of the fusible element. The functions of melting and heating are separated in one type of fusible cut-out commercially available, and heat is transmitted from a calibrated copper " neck " to a tin and copper fusible element. The tin runs at a lower temperature than the restricted portion of the element and heat is transmitted from the restricted portion in proportion to the load carried by it. When the load reaches a value which causes sufficient heat to be transmitted to the tin portion to melt it, the circuit is broken. With this arrangement it is possible to get a fusing-current/load-current ratio of 1.2 to 1.

At the moment of rupture the metallic fusible element becomes a conducting vapour path. It is important to reduce the temperature rapidly in order to reduce the arc energy to the lowest possible value. In cartridges the filling cools and condenses the metallic vapour, and a sub-divided or multiple element, or the equivalent, gives the dual advantage of a greater surface area in contact with the filler, whilst the increased radiation surface enables a smaller aggregate section to be used for a given current.

A proper magnetic arc blow-out at the point of rupture decreases the arcing time, but, if misapplied, may produce voltage harmonics often of a dangerous amplitude; incorrect form may introduce complex phenomena, resulting in a greater amount of arc energy than with a simple non-magnetic blow-out fusible cut-out. A comparison of arc characteristics to illustrate this point is given in fig. 1. If magnetic blow-out be adopted, it should be of simple and finite form; commercial forms, both for switches and fuses, are far from simple. The most reliable blow-out so far tested for heavy-current fusible cut-outs was obtained by bending the main leads at right angles for a few inches so that there was a tendency for the fuse element to be blown away from the ends of the conductors. In tests with currents ranging up to 100,000 amperes, portions of the fusible elements were blown 300 ft. away.

All fusible elements should be enclosed; many forms of enclosure at present in use are defective. When clearing any considerable amount of power there is a strong tendency for arcing to be set up to the metal housing and to adjacent poles, and no form of internal insulation so far tested has been found capable of preventing trouble of this nature. Fibre, bakelite, glass and similar enclosures are of poor mechanical strength, which is unfortunate, as their proximity to the point of rupture exposes them to high pressures. When rupturing a power of the order of 30,000 kVA per phase, pressures of the order of 1,000-2,000 lb. per sq. in. were measured approximately 1 inch from the point of rupture, and there is reason to believe that higher pressures are set up. The tests have not brought to light any liquid which reduces appreciably the pressure set up at the moment of rupture.

Enclosure in metal containers without damping substances has been found to be inadequate, chiefly because of the unrestricted range of the arc and the explosive effect which results in destruction of the carrier and arcing to the framework. When immersed in oil, the arc is restricted to a comparatively small space, but the pressures set up are not reduced. This necessitates a strong housing and the dimensions of the parts approximate to those usual for oil switches, which increases the cost, but results in apparatus having an intrinsically higher rupturing capacity than fuses of the insulated-container type. The increased rupturing capacity is obtained in a way that has so far proved to be a sound method of investing money in oil-immersed fuses or switchgear, namely, by the provision of mechanical strength. On a 6,000-volt three-phase pattern when rupturing approximately 50,000 kVA, pressures of the order of 600 lb. per sq. in. have been measured within 2 in. of the arc, and up to 200 lb. per sq. in. at the walls of the container.

Oxidation troubles are usually accentuated through the tendency of the filler to support the oxide film. Loosely packed filling avoids to some extent the holding-up action on the fusible element, but introduces a certain amount of oxygen and consequently increases the risk of explosion. A tightly packed filling, although practically eliminating oxygen, supports the fusible element and the oxide film and the molten material of the fusible element is prevented from being driven into the filler to be cooled. Good filling for cartridge fuses can be formed by using a calcium-carbonate base; also it is an effective arc damper, but it is possible for it to assist rather than quell the disruptive agencies; the introduction of a restrainer controls the action. Excellent results have been obtained with simple inert fillers, such as sand, but the gas pressures set up are likely to be higher with a filler of this sort than with fillers of the controlled type.

Fibre has been largely used for tubular fuse containers, but the common forms are not strong enough to withstand the pressure set up, and, furthermore, it is hygroscopic. Porcelain is perhaps better than glass mechanically, and the chief troubles with Bakelite are the non-uniformity of batches, conductivity along the laminæ, and, perhaps, the price. Special bakelised fibre has been found to give the best all-round results. The fixing of the end-caps in cartirdge fuses is an important matter.

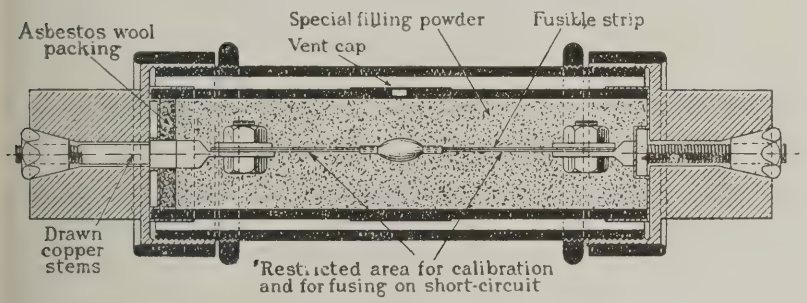

Fig. 2.—Section of Filled Cartridge Fuse.

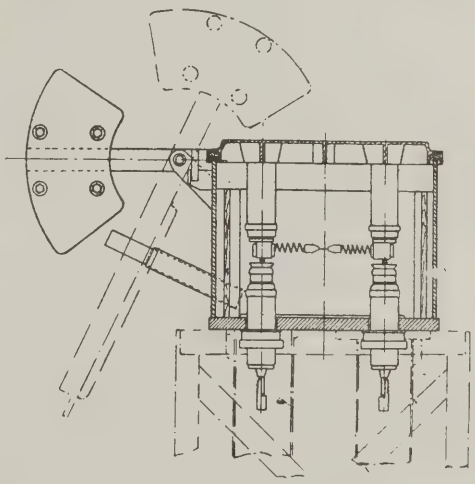

Fig. 3.—Section of Oil-immersed Fuse.

Rupturing Capacity Tests.—A piece of wire stretched between terminals in the open air could be regarded as superior to confining the wire in a carrier. Furthermore, it is a legitimate criticism to object to the carrier on other grounds, *i.e.*, it is usually formed of a comparatively fragile substance which is liable to splinter into dangerous fragments. A piece of fuse wire between terminals will clear short-circuits every time if the gap is large enough. On 6,000 volts a 24-in. gap gives moderate results, the important thing, however, is that the process of rupturing is not materially different from any of the undamped forms of fusible cut-out. Precisely the same experiences were obtained on and below 440 volts; a tremendous destructive explosion took place.

Consider, then, this simple arrangement with a correspondingly shortened break connected to a source of power capable of giving a short-circuit power of the order of 50,000 kVA at 440 volts, a likely condition, as was pointed out in an earlier section of this paper. Some engineers would put the same wire into a porcelain, or other, carrier (an addition of questionable merit) and would then consider, for some obscure reason, that conditions were entirely different. Others would go to the trouble of specifying the dimensions of the carrier, the confining case, size of the contacts and other factors which, from the rupturing-capacity point of view, are irrelevant, whilst neglecting the fundamental insecurity of the arrangement.

The problem must be attacked in a more logical way; let us seek the prime cause of the trouble. The rupturing of the circuit produces a certain amount of thermal energy at the arc, generated in an explosive manner, and the immediate result is the production of an arc and the unnecessary explosion of a quantity of vapour. The proper way to tackle the problem would be to reduce, first, the arc energy, and, secondly, to control the explosive effect; efforts to do this with simple fusing arrangements have met with no material result. The performance of a simple power fuse is described in some detail

in the paper in an attempt to present a picture of the performance of the majority of power cut-outs of this type. The tests were a reproduction of the conditions obtaining with the auxiliary supply in a modern power station, and were similar to the conditions to be found to-day on many a.c. distribution systems.

A three-phase transformer bank consisting of two 1,200-kVA transformers in parallel was coupled to a 6,000-kVA, three-phase, 6,600-volt turbo-alternator capable of giving a maximum of 70,000 kVA on dead short-circuit, and the results were disastrous, there being a huge flash and report accompanied by flying fragments, and it is almost certain that any person or apparatus in the neighbourhood would have been badly damaged.

In subsequent tests the fuses operated with the usual intolerable explosion, with flame and burning fragments ejected in all directions, but cleared the fault, and serve to show that open fuses, however, carefully designed, are inadequate on heavy-duty work and are dangerous alike to the operators and to all apparatus associated with them. Similar tests were carried out on many commercial tubular fuses with liquid, powder, and other fillings, and for various voltages. In the majority of the tests the fuses were totally destroyed, resulting in an open arc and explosion between the main contacts. A representative selection of these tests are described in the paper. Similar tests were carried out on many types of powder filled cartridge fuses, several variations of a modern design of filled cartridge fuse (fig. 2) and an iron-clad oil-immersed fuse of modern design (fig. 3).

Modern, filled, cartridge fuses put up an entirely different performance from the old pattern referred to above. Low-voltage, heavy-current, and high-pressure fusible cut-outs (up to 6,000 volts) were tested with equally good results. One design is that of a robust cartridge fuse with a bakelised fibre container and strong metal ends. For extra heavy duty, a double container is used with a venting arrangement between the inner and outer containers. The vent is quite effective;

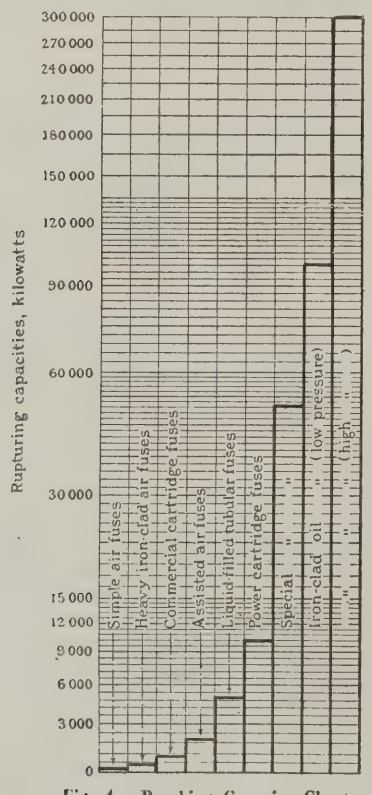

Fig. 4.—Breaking Capacity Chart.

a thin paper seal across a hole of pre-determined dimensions is used. The filling has calcium carbonate as a basis, and in similar tests to those which resulted in the destruction of the plain air and tubular cut-outs, the present one cleared satisfactorily with no sign of flash or flame and no report. It was perfectly safe to be in the vicinity when this cut-out was opening a potential short-circuit of the order of 100,000 amperes.

Another fusible cut-out tested had a single moulded container reinforced with metal bands and a simple inert filler of clean sand. It is capable of standing up to short-circuits of considerable magnitude and at voltages up to 440 and has operated satisfactorily up to 1,500 volts unaccompanied by any noise or flame.

A fourth type was the 600-volt, three-phase, 200-ampere iron-clad pattern with oil-immersed elements. The three phases were mounted within 2 in. of one another and within similar distance of an earthed iron case, yet this fuse broke short-circuits similar to those which destroyed the other fuses, without any sign of operation other than the ejection of a slight spray of oil through a somewhat faulty flange, and at no time was there any dangerous symptom.

As the result of these investigations, a curve has been prepared to assess the rupturing capacity of fuses of various types, fig. 4, and the information has been obtained largely by test. Column 9 (high-pressure oil cut-outs) has been extended to 30,000 kVA on the evidence of the performance of oil circuit-breakers similar in dimensions to these oil-immersed cut-outs.

(To be concluded.)

Discussion in London.

Mr. R. W. Gregory commenced the discussion by characterising the paper as a very valuable one which indicated persistent research. A proper fuse which cleared the short-circuit in the first half-cycle produced the least shock and damage to the plant and itself, in contrast with circuit breakers. High-speed circuit breakers, which had become the fashion in traction stations, were relied upon by the designers of the rotary converters to protect their machines, and they would not guarantee a rotary unless it was provided with such a breaker. The devices described by the author could really be called high-speed breakers for a.c. work, and his industrial type designs would be found very useful. He (the speaker) had attended too many inquests on fuses not to appreciate the value of the author's work, and it was satisfactory to learn how to replace the old dangerous and inadequate types, and to know that oil-immersed and powder-filled fuses were obtainable for modern requirements. High-pressure fuses were a revival and the paper recorded a very great advance in the art of protective gear. There was, however, a lack of knowledge on the subject of sequence discrimination.

Mr. P. D. Morgan pointed out that the paper represented very many tests carried out over a long period, and it clearly indicated that the prevalent idea that fusible cut-outs could not be relied upon for heavy duty was erroneous. Certain terms that the author had used to denote some things in his paper differed from the terms used by the B.E.S.A. and Research Association, an unimportant point perhaps, but it had been known to be the cause of serious misunderstanding. A nomenclature list was at present under consideration by the B.E.S.A. and Research Association, together with the factors which influenced deterioration; much interesting information had been collected and was being embodied in a report on the subject. The author's oil-immersed cut-out tests had been made with a.c. only and it was doubtful whether low-voltage d.c. tests would have produced similar results; a comparison should have been made. The Research Association had recently obtained the use of a large battery of accumulators at the L.M. & S. Railway's Stonebridge Park electricity generating station and it would be used for a series of d.c. tests on fusible cut-outs.

Mr. H. W. Clothier described the paper as a herculean work which would have done credit to a research committee, but the author had not needed anything like so long a time as the former would have done to produce results. He was glad to hear that facilities had been made available for carrying out corresponding d.c. tests. With reference to nomenclature, he remarked that the tests described in the paper had created a new term, *i.e.*, "potential short circuit," which meant that the amount of power plant behind the fuse was taken into account, but the choice of the word "potential" was unhappy because it would be apt to be confused with voltage. In discussing the rating of a fuse, he thought the author too optimistic when he spoke of a fusing current/load-current ratio of 1.2 to 1, which had been obtained from experiments with the fuse illustrated in fig. 2; the functioning of that device would really depend on the heat conducted from the restricted portions of the drawn-copper stems to the fusible strip, and the time factor of heat transmission from the copper to the central bulb was the controlling factor. He was glad the author had made such good use of the metal-clad feature, and his work would have a beneficial influence on the supply of power in rural areas.

Mr. A. Hooker, who said he was speaking on behalf of the student members, was of the opinion that there was a considerable field of usefulness for fusible cut-outs in rural h.p. work. It was high time the subject was given the attention it deserved in the college curriculum, where it had not hitherto featured It was desirable to make the fuse container transparent, if only for inspection purposes, and in that connection silica might be of use.

Capt. P. Dunsheath said the paper would have been improved if the author had recorded the conclusions he reached as he proceeded; he had apparently assumed that readers had studied the subject as much as he had. The one-minute fusing current had not been dealt with, which was a rather serious omission, and another most important point had been overlooked. In the construction of fuses, restriction of the expansion of the gases which formed in the container when the fuse blew had been accidental and was deplored rather than made use of. In a new pattern of fuse which he had constructed, the fusible element was enclosed in a fibre tube (little bigger than the wire itself) that was strong enough to withstand the pressure generated when the fuse operated, which pressure damped the arc and reduced the violence of the explosion. Such fuses had consistently ruptured from 1,500 to 2,000 kW, d.c., at 250 volts, and were four times as good as other types of cartridge fuse of similar dimensions. Engineers should be capable of designing fuse enclosures which would stand pressures up to one ton per sq. in.

Mr. V. Hope referred to the performance figures of "Aeroflex" fuses, remarking that they had from two to three times the carrying capacity of other patterns. He pointed out the large space required for the accommodation of limiting resist-

ances, and said that surely such devices were not necessary if the fuse was made to do its best. With regard to oil-immersed fuses, he was prejudiced somewhat, but the liquid was the wrong one to use for it aggravated matters by creating gases itself and so increasing the pressure generated. However, no one had yet discovered a better liquid to perform the required function.

Mr. H. BRAZIL remarked that the new fuse Capt. Dunsheath had exhibited seemed almost too good to be true. He personally used a combined pressure and oil-immersed type; the glass containers had had to be strengthened, however, and springs were added to hasten the oil immersion. Regarding cartridge fuses, a type filled with marble dust and containing several silver wires had been successful.

The author (Mr. L. C. GRANT), in reply to the debate, intimated that he would deal fully with the various points that had been raised in the I.E.E. *Journal*. It was not advocated that from 10 to 20 per cent. more should be paid for a good fuse, but for one that operated in an entirely different manner (for small powers). Rupturing capacity was fundamental and was the first aspect to be tackled; others (such as rating, in connection with which much remained to be done) had only been introduced where they could not be avoided; regarding omissions from the paper, his difficulty was to keep it within reasonable length. Silica had been considered, but it was very similar to glass in so far as shock, &c., was concerned. Mr. Hope's fuse was known to operate very well.

The president (Mr. R. A. CHATTOCK), in calling for a vote of thanks to the author, said his paper was specially interesting just now when all engineers were trying to cheapen switchgear.

Induced-Current Cooking.

The New "Falkirk" Electric Cooking Apparatus.

As we mentioned in our issue of March 19th, the FALKIRK IRON CO., LTD., has recently introduced a range of electric cooking and water-heating apparatus depending for its functions on the principle of induced electric currents. The feature of the

Fig. 1.—15-kW Inducer Apparatus.

equipment is a transformer or inducer, the core of which is built up of laminated plates in the usual way, securely clamped together. A portion of the core is removable, thus breaking the magnetic circuit, this being necessary to link the cooking utensil or secondary circuit. For this purpose the foot of the utensil is arranged as a loop or one-turn coil of heavy nickelled copper, specially constructed utensils of course being necessary. The primary coils are securely fitted in place, and are

Fig. 2.—Domestic Suite and Separate Inducers.

of enamelled copper strip, bakelised after winding, and are connected in series or parallel to the control switches according to the supply voltage and the heat required.

In the case of single portable models, an outer casing and cover conceal and protect the primary circuit and main terminals, the casing being suitably earthed. The movable portion of the inducer, or keeper, is supported at the back on a suitable standard with springs which hold it above the transformer when the utensil is off, and allow it to close the core when pan is on. The exposed parts of the inducer are covered with a bright polished metal which does not tarnish, and as the demonstrations milk and fat were allowed to boil over on to these parts without harming them in any way. A special automatic switch is fitted to these models to prevent the keeper from being pulled down magnetically if the switch is closed when vessel is off.

The domestic oven, of which only a first model is available for inspection at present, employs induced current for roasting only, ordinary radiant-heat elements being used for other cooking. It is strongly constructed of steel and suitably lagged all round. The resistance elements are built in suitable frames which can be placed at the top, sides, or bottom of the oven as required, pin and socket contacts being employed. The elements are wired for multi-heat regulation and the cooking space may be limited by placing a horizontal element-containing shelf at any required height in the oven, the side or top elements being arranged accordingly.

The induced current for roasting is conveyed to and from the joint by means of special contacts; a steel plate laid in the bottom of the meat pan, and on which the meat rests, forms one of these, and a chain mesh which is laid over the meat forms the other. It is necessary to have lean cuts on the meat for both the top and bottom contacts. It is claimed that the chain is easily kept clean by plunging it into hot water and soda and drying it in an oven. The inducer for roasting is placed externally to the oven and the current is derived from a pair of coils wound so that when the domestic inducer is being used for oven work, it practically becomes an auto-transformer. The keeper is pressed into position and current switched on "high"; a small lever is then raised which acts as a switch for the oven coils and also prevents a pan from being placed in position on the inducer. The oven is used in connection with the domestic suite, fig. 2, which consists of one 3.7-kW and two 2.75-kW inducers and the oven, about 5½ kW, and the larger inducer is equipped for the oven cooking.

For heavy appliances for use in restaurants, hotels or ships, the boiling tables would consist of heavy inducers, 15 kW, fig. 1, let in flush with the table and built up in batteries to suit requirements. Large boiling pans of 20-25 gal. capacity, fish fryers, and water boilers, are equipped with the 15-kW units fixed permanently in the base of the apparatus. In the case of the water boilers part of the induced-current circuit is in the form of a tube through which the water in the tank circulates.

A Hyper-Super Station.—A recent note upon developments at St. Helens was given the heading "32,000,000 Kilowatt Power House" by the *Liverpool Express*. If this became the "selected station" under the Government scheme, it would produce quite enough for the Central Board to deal with.

The Electricity Supply Bill.

Some Comments on the Scheme.

At the annual meeting of the Salt Union, Ltd., on March 23rd, the chairman, Mr. Geo. H. Cox, said there was no subject about which more nonsense had been disseminated of late than that connected with the cost of production and distribution of electricity. The general public might consequently have been misled as to what was practicable. It was significant that the chairmen of several important electrical undertakings had recently expressed themselves strongly concerning the harm that might be done by well-meant Government interference, even if the administration was conducted through a statutory Board. The painful experience of the Mersey Power Company entirely confirmed this, as its progress during the last few years had been tremendously hampered. The Electricity Bill was calculated to create endless trouble and to fasten the dead hand of bureaucracy upon the industry, thereby crushing enterprise and progress. As drafted, it might be used to treat unfairly the existing up-to-date producers and undertakers. This would bear very hardly, for example, on such a concern as the Mersey Power Company, which, after a long and desperate struggle (not altogether unconnected with matters of control) was now within sight of reaping the fruits of its uphill task. Several stations had been equally successful and if let alone the efficient undertakings would quickly fill all the requirements of the country. He agreed with those who regarded the threatened legislation as quite uncalled for, and they would take every available and proper means to get the objectionable clauses of the Bill drastically amended. He did not object to reasonable public control when monopolies were granted such as the sole right to supply certain areas, but this was safeguarded by existing statutes. He also realised that the general interests would be served by the standardisation of frequency as proposed, while the fact that the Bill sought to make electricity much more widely used by means of greatly extended transmission cables was admirable. The estimated sales of current by the Mersey Power Co. this year would be appreciably increased owing to the demand of Crewe, Northwich, &c. New machinery was being installed to enable them to double their output; already they were selling at the rate of over a million units per week.

Mr. H. E. Parkes, president of the Birmingham Chamber of Commerce, in his address at the annual meeting last week, referred to the Electricity Bill. It would, he said, take a good deal to convince manufacturers that the advantage of changing from one periodicity to the other would be worth the enormous expenditure that it would throw upon everyone concerned. It would have been wiser had the Government put a skeleton Bill up for discussion and negotiation before it put a definite Bill before the House of Commons to which it as a Government was committed.

A statement issued on behalf of the Provincial Electric Supply Committee of the United Kingdom, representing practically all provincial electric supply companies, says that the declared object of the Bill is to enable electricity to be generated more cheaply than it is at present, but cheaper generation will not necessarily mean cheaper supplies if it involves, as appears to be inevitable, heavy capital charges, expensive transmission, and costly administration. The fulfilment of the scheme will occupy many years, and the immediate effect is likely to be disadvantageous to electricity users.

The anticipated beneficial results from the Central Electricity Board are based upon a large expansion of the use of electricity. If, after the expenditure of the large sum of money proposed, the increased output is not obtained within a reasonable time, the burden of the interest charges on that sum, with the addition of the administration charges of the Central Electricity Board, will seriously increase the cost of electricity.

The Committee is of the opinion that the Bill, in its present form, will not produce the results which are anticipated. It imposes greater disabilities and restrictions on existing undertakers. Cheap electricity in bulk can be better ensured by giving wider power and relief from existing disabilities and restrictions.

The Committee is of the opinion that it is not in the interest of the technical development of the generation of electricity that this work should be concentrated in the hands of a very limited number of individuals. Concentration in too few hands eliminates that competition of ideas on which progress so largely depends, and tends to stereotype existing methods. This would ultimately react on the efficiency of electricity supply in this country.

The experience of electricity supply companies is that the principal causes at present preventing more rapid development in their areas are:—(a) Uncertainty of tenure; (b) Uncertainty of the price to be paid under compulsory purchase. The Bill does not remove these difficulties.

The Bill is drastic in character, and unless materially altered in Committee is in the highest degree detrimental to the industry.

Electricity is the key of the nation's industries. The Government's Bill, in its present form, fetters private enterprise, and must lead to confusion and higher costs. It is a step in the direction of complete State control of a great key industry and will facilitate the Socialist Party's avowed intention of nationalisation.

In the course of a circular addressed to the shareholders in the Yorkshire Electric Power Company, the Chairman, Mr. Arthur G. Lupton, states that the Power Companies were entrusted with the business of supplying in bulk to authorised distributors, and in face of great difficulties and despite many restrictions placed on them as a result of municipal opposition, they have, by the energy and initiative of private enterprise, built up large undertakings. They supply electricity in some of the most important industrial areas of the country, and their combined sales of electricity amount approximately to one quarter of the total sold by all the authorised undertakers in the country. The average price of the electricity sold by the Power Companies last year was less than one penny per unit. The Government's proposals will involve a serious interference with private enterprise, and a great and needless expense at a time when the burdens of national and local taxation are already becoming intolerable. The establishment of the Central Electricity Board will place the control of generation under a body of persons not directly responsible to Parliament and against whose decisions there is, in many matters, no effective means of appeal. Many thousands of investors have put their savings into electric Power Companies' shares. This Bill, if confirmed, will greatly reduce the market value of these securities, and render it impossible to secure further capital at anything approximating to the same favourable rates. The shareholders of the Yorkshire Electric Power Company have invested over 3¾ millions of capital in the belief that powers conferred by Parliament would not be interfered with; it will be a grave disaster if this faith in Parliamentary obligations is destroyed.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Electricity Bill and Broadcasting.—On March 22nd, Mr. G. Balfour asked the Prime Minister whether his attention had been called to a speech on March 19th, and broadcast by the British Broadcasting Company, describing the Government's electricity proposals as "Socialism in small doses"; whether he was further aware that on the same occasion the Chief Electricity Commissioner, Sir John Snell, in a speech delivered by him and broadcast, advocated the Government proposals; and what action he proposed to take.

Mr. Baldwin said that permission was given for broadcasting the speeches on the usual understanding that the speakers would refrain from controversial statements of a political character. As regarded Sir John Snell, he was informed that he gave a review of the electrical position in this country, and stated his view as to the line of technical improvement desirable. His only reference to politics was a mention of the Bill now before Parliament. He asked the electrical experts present to give constructive criticism.

The Cost of Standardising Frequency.—On March 22nd, Mr. Raine asked the Minister of Transport whether he had consulted any experts with regard to the cost of converting all the electrical plant in the country from 25 periods to 50 periods; and whether any estimate was available as to the probable cost of such conversion.

Colonel Ashley said that a report was prepared by Messrs. Merz & McLellan, the eminent consulting engineers. The results were given in the report of the committee under the chairmanship of Lord Weir.

On the same day Mr. Preston asked the Minister of Transport, if he would authorise the publication of the Merz Report, submitted to the Electricity Commissioners in respect of the standardisation of frequency in Great Britain.

Colonel Ashley said that the conclusions as to the cost of standardisation of frequency proposed by Messrs. Merz and McLellan were given in paragraph 88 of the report of the committee under the chairmanship of Lord Weir. He did not propose to publish the whole report.

Long-Distance Transmission.—On March 22nd, Major Ainsworth asked the Minister of Transport whether, in view of the introduction of the Electricity (Supply) Bill, he proposed to investigate, from the point of view of cost, the conditions of transmission of power over long distances.

Colonel Ashley said that the question of the cost of the transmission of power over long distances entered into, and constituted a part of, the investigation made by the Chairman of the Electricity Commissioners in preparing the memorandum appended to the report of Lord Weir's Committee.

Smoke Abatement.—On March 23rd, in the House of Lords, Lord Gage, in moving the second reading of the Public Health (Smoke Abatement) Bill, said that the first clause of the measure made it possible to take proceedings in respect of smoke nuisances, irrespective of the colour of the smoke. It extended the exemption from legal proceedings to certain premises, chiefly connected with the steel trade, and enabled the Minister of Health, subject to confirmation by Parliament, to exempt other premises. Clause 2 enabled local authorities to set up standards of smoke emission, subject to confirmation by the Minister. Clause 4 enabled local authorities to require that certain new buildings should be provided with arrangements for smokeless heating. While it was obviously impossible to require the alteration of heating arrangements in existing buildings, the Minister considered that it should be possible to enforce smokeless heating arrangements in new buildings. It was considered that the extension of the provisions of the Bill to dwelling-houses would not be compat-

ble with the rapid and inexpensive provision of working-class houses.

The Bill was read a second time.

Municipal Electrical Service.—Elsewhere in this issue we continue the report of the proceedings of the Committee upon the Colwyn Bay Bill, and also deal with the Committee stage of the Doncaster Corporation Bill. The Guildford Corporation Bill was read a second time on March 24th, and, later, Mr. Campbell moved: "That it be an instruction to the Committee on the Bill that they shall leave out Clauses 52 and 53." He said that Clause 52 empowered the Corporation to sell electrical fittings, and Clause 53 sought to confer powers for the establishment of showrooms. It was said, in support of these clauses, that 70 or 80 municipal authorities already possessed those powers, but having been a trader and a merchant all his life, he was opposed to municipal trading.

Sir Harry Foster, who seconded, suggested that before the business of private electrical firms and contractors in this country, employing capital which was estimated to amount to about £3,000,000, was subjected to unfair, rate-aided competition, the matter should be inquired into by a Joint Committee of both Houses.

Sir H. Buckingham, the Unionist member for Guildford, in opposing the instruction, thought that the House had been led away entirely on the question of municipal trading. The present question was not one of municipal trading at all, but purely a matter of business, and if the clauses in question were passed it would mean good business for Guildford. In these modern days all those small houses ought to be wired and equipped with electricity, but in many cases the occupiers or owners were not able to put down the necessary capital for the installation, except on the deferred payment system, and local contractors would not, as a rule, put in electrical installations on such terms.

Mr. Attlee, who also opposed the instruction, said that up to a short time ago Guildford's electricity was supplied by a company. The result was that there were a number of breakdowns, no dividends were paid, and the company did not reduce the price of electricity. The town had now taken over the business, with the result that it now paid its way, there had been no more breakdowns, and the cost of electricity had been reduced from 11d. to 7½d. per kWh.

After further discussion, the motion for the instruction was rejected.

Post Office Tube Railway.—On March 23rd, Mr. Broad asked as to the present position of the Post Office (London) Tube Railway.

Lord Wolmer, Assistant Postmaster-General, said that the permanent way had been completed; the bulk of the electrical plant had been manufactured and its installation was proceeding rapidly. It was anticipated that the railway would be available for traffic in the autumn. The sum provided under the Post Office (London) Railway Act, 1913, was £1,100,000; the sum expended to date was £1,411,000.

The Electricity Bill.—On March 29th, Col. Ashley, the Minister of Transport, moved the second reading of the Electricity (Supply) Bill in the House of Commons.

Before the debate began Mr. D. Herbert, who had on the Order Paper a motion to reject the Bill, submitted that the motion for the second reading could not be proceeded with until the measure had been referred to the Examiners for report as to whether it affected private rights.

The Speaker said that he had examined the Bill carefully, and had come to the conclusion that it need not be submitted to the Examiners.

Col. Ashley said that this country was unfortunately behind many others in electrical development. There were in this country 592 public utility stations, of which 494 belonged to authorised undertakers, many very small. Thirty-two were responsible for 50 per cent. of the total output, while 462 between them were required to generate the other 50 per cent. That was wrong. Experts told him that the question of load factor was the crux of the whole matter. The average load factor was no higher than 25 per cent., which meant that only one-quarter of the plant was working at full capacity. To improve this load factor was really the great object of the Bill and should be the object of all electrical reform. Only one-third of Great Britain was reasonably supplied with electricity. Practically all the rest was supplied by small undertakings, incapable of generating electricity except at an unreasonably high cost. The Bill aimed at levelling up the efficiency of generating stations. The present yearly consumption of electricity per head of the population was only 118 units, as compared with Italy 140, France and Germany 200, Belgium 230, Norway and Sweden 500, U.S.A. 500, Switzerland 700, Canada 900. How could we hold our own in trade while we consumed only half the units per head of population that Belgium did? Some reorganisation was absolutely necessary. There was no fear that if we reorganised our plant we could not produce power as cheaply as our commercial competitors. We must foster the development of mass production by means of large generating units in big interconnected stations. Cheapness was largely a matter of big generating stations. Cheaper electricity would enable more efficient modern machinery to be installed for commercial purposes. It was doubtful whether we had more than 34 per cent. of our industrial equipment engaged in production operated by electricity. It was estimated that in 15 years the annual consumption per head of population in this country should increase to 500 units. If the Bill became law it was estimated that by 1940 the saving to the consuming public would have reached £44,000,000 per year over and above the normal economies which might have been effected if the Bill had not been introduced. They were also pathetically behind other countries in labour-saving devices for housewives. In America 1,000,000 curling irons were operated by electricity and housewives had learned to be happy though servantless. The Bill would also help agriculture.

The Bill rightly emphasised the distinction to be drawn between distribution and generation. Distribution was left in the hands of existing authorities. The Bill maintained the principle of separate authorities with all the stimulus of local management. With regard to generation the Government had no desire to interfere with ownership and management more than was necessary. The sole function of the Central Electricity Board would be co-ordination; it would be essentially an organising body. It would be a commercial concern, and its commercial discretion would be absolutely unfettered. It would not be a Government Department in any sense of the word. The Board would be appointed by the Minister. If there was to be interconnection there must be standardisation of frequency. The extent to which this might be necessary and the time for doing it were left by the Bill to the Board. Under Clause 9 the Board was given power to require standardisation on the understanding that it must bear the whole expenditure, including the cost of altering or replacing the plant of the consumer. The Weir Committee recommended that the cost of standardisation should be met out of State funds and suggested that this expenditure might be repaid, without interest, through the operation of the Board. The Government, however, did not feel justified in putting this burden upon the taxpayer, and after it had gone very closely into the figures it decided that the whole expense should be met by the Board and could be so met without detriment to the scheme, and accordingly the cost was made a capital charge of the Board.

Turning to the finances of the Board and remembering that real economy consisted in a judicious expenditure of money, the Weir Committee decided that the capital required under the scheme would be £25,000,000 and that this sum should be guaranteed as to principal and interest. That estimate had been accepted and when to that had been added the cost of standardisation it would be found that the capital authorised under the Bill stood at £33,500,000 sterling. The primary object of the Bill was to reduce the price of electricity; accordingly provisions were inserted to ensure that any saving in generation should be passed on to the consumer.

Sir J. Marriott asked whether £33,500,000 would be sufficient to cover the acquisition of those stations which were to be shut down?

Col. Ashley said he could not tell how many cases there might be. He could not imagine that there would be many of them.

He asked the House no longer to approach this great question from a parochial point of view, but to use some imagination and faith with regard to it. He could not conceive that this Bill would hurt the gas industry in any way whatever. Such a scheme had never done so in America and in other places, where these two industries were working side by side and sometimes hand in hand. The prosperity of the one had meant the prosperity of the other. He appealed to all the power companies and the municipal authorities which operated and owned electricity stations. They were not asked to give up the ownership of their stations; they were not asked to give up the ordinary management of their stations; but what they were asked to do was to submit to a co-ordinative control as to the hours they should work, what peak load they should put into operation and generally to assent to a general co-ordination all over the country. How could that hurt them at all? They stood to gain substantially in three ways. The whole of their output was guaranteed to be taken. Their stock in his judgment would become gilt-edged and more valuable than it was at present. They would sell a greater number of units under the scheme, and would secure a greater saving per unit than they did before. Their sale of electrical apparatus, such as cookers, &c., would be increased and generally they would do much more business than they were doing at present.

Mr. D. Herbert: The Minister says that these companies would have a guarantee that all their output would be taken?

Col. Ashley: Yes, certainly. The way they are to generate is to be laid down and the whole of their output is to be taken by the Board.

Mr. D. Herbert: By the Board which decides how much they are to generate?

Col. Ashley: Certainly. Proceeding, the Minister also appealed to the owners of the stations which might have to shut down. He knew, he said, that no one liked to have his own pet station and his own pet business done away with, but distribution would remain. It was only generation in small stations which was to be done away with and if one could get something cheaper than one was now making it, then surely it was no great hardship to anyone. In the Bill the Government had endeavoured to carry out the principles in which it believed—that it was not the business of the Government to manage or operate, but to co-ordinate and to control. The State should leave to agencies, private companies, or public authorities those operations which they could carry out themselves. No Parliament working through a bureaucracy could have achieved the progress or made the discoveries in the electrical industry which had emerged in recent years. But the Government could regulate—and rightly regulate—public utilities.

Mr. W. Graham, on behalf of the Labour Party, moved:—"That this House, considering that the urgent need of the nation for a cheap and abundant supply of electricity can best be secured by the development of a publicly owned and controlled system of generation, main transmission, and distribution, cannot agree to the second reading of a Bill which fails

to provide for the co-ordination of the production of coal and its by-products with electrical generation, creates cumbrous machinery, strengthens and extends the hold of profit-making companies over an indispensable public service, continues the limitation of municipal undertakings in confined and uneconomical areas of distribution, and affords to consumers in company areas no adequate protection against excessive charges for light and power." He explained that the Labour Party advocated a solution of the whole question on the principle of public ownership by the State. The Government had been driven to their present proposals by economic forces beyond their control. Administratively the Bill exceeded the worst complication that any member of the Socialist Party could devise, while financially it was rotten.

Mr. D. Herbert, a Unionist, declared that the measure did not place the industry under the control of the Government, but under the control of an autocratic Board, the members of which were appointed not by Parliament but by the Minister of Transport. The entire generation of electricity was to become an absolute monopoly of the Board. The Government had brought forward a thoroughly impracticable scheme, the failure of which would put the industry back for 10 or 25 years.

Mr. P. Harris, a Liberal, supported the Bill.

Mr. R. S. Hudson believed that under the Bill the cheapening of the supply of electricity would make the demand so large that the last possible excuse for nationalisation would be cut away.

Sir C. Wilson declared that the Government were seeking to impose an unjustifiable tyranny on the great municipalities.

Mr. Hardie, a Labour member, objected to the payment of £33,500,000 to wipe up the mess of private enterprise.

Mr. Burman, one of the Unionist members for Birmingham, urged the Government to give some right of appeal from the Central Board, so that the non-standard undertakings might know exactly where they stood, and to give them a certain amount of time to change over.

Mr. T. J. O'Connor, another Unionist, said that the Bill would not, as at present designed, produce cheap electricity. This view was also taken by other Unionists, among them being Mr. P. J. Hannon, who, as one directly interested in electrical undertakings, declared the measure to be impossible.

Major Kindersley based his objection to the Bill on financial grounds. The measure asked them to underwrite in advance a sum of £33,500,000 for an enterprise the details of which had not been examined by the three gentlemen whose report they were asked to accept blindly. If the Bill could not produce a scheme which would stand the scrutiny of the business community it should receive no guarantee from the taxpayer.

Mr. Grotrian said that if left to itself the electrical industry would accomplish everything that the Bill set out to do.

Lord Apsley, one of the few Unionist members who spoke in support of the Bill, believed that they were on the eve of a great enterprise.

Sir G. Hume, another Unionist, considered that without a measure of compulsion, it would be impossible to do anything from a national point of view. The country had made up its mind that something had to be done, and he had heard of no alternative to the Government proposals except the Socialist amendment. He would support the Bill, but he felt strongly that there must be a right of appeal.

Mr. T. Thomson, a Liberal, contended that if the Government had applied compulsory powers to existing legislation it would have achieved greater success than the present extraordinarily hotch-potch measure. There should be more control by Parliament than was provided for in the Bill.

Commander Burney urged that the Bill should provide for the standardisation of pressure as well as of frequency.

Mr. Clarry said that the gas industry would not oppose the Bill, but strongly resented the fact that there was no appeal from the decisions of the Electricity Commissioners.

Major Attlee (Labour) complained that the Bill did not provide for the control of distribution or of the prices charged, which should not be left in the hands of companies.

Lieut.-Col. Moore-Brabazon, Parliamentary Secretary to the Ministry of Transport, said that no one could maintain that the present position was satisfactory. Distribution was not touched by the Bill, but the cost of generation would be greatly reduced. If it were thought right to generate electricity at the pit mouth, or if low-temperature carbonisation became possible, the Bill put no obstacle in the way.

The debate was adjourned on the motion of Mr. G. Balfour.

(To be concluded.)

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from March 24th :—

Sylva (lettering and design). No. 465,335. Class 8. Thermionic valves. No. 465,430. Class 13. Electric lamps (ordinary).—Julius Axelrad, 25, Mornington Crescent, N.W.1, and 14, Leopold Ernst Gasse, Vienna.

Tungstron (lettering and design). No. 465,336. Class 8. Apparatus for use in radio-telephony and telegraphy, but not including electric accumulators. No. 465,431. Class 13. Electric lamps (ordinary).—Julius Axelrad ((address as above).

A.C.C., Ltd. (lettering and design). No. 466,830. Class 8. Thermionic valves, electric lamps (philosophical), vacuum tubes, electric signs, X-ray tubes and apparatus, not for medical or surgical purposes, electric furnaces, &c.—A. C. Cossor, Ltd.

Correction.—The number and correct description of the trade mark applied for by the British Ebonite Co., Ltd. (*vide* our issue of March 19th), are 466,435 and "Becolate."

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

21,289. "Electromagnetic acoustic devices." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). September 9th, 1924. (248,412.)

26,527. "Electric transformers." S. Z. De Ferranti and Ferranti, Ltd. November 6th, 1924. (248,429.)

26,618. "Electric current controllers." Alloy Welding Processes, Ltd., and R. W. Happe. November 7th, 1924. (248,430.)

28,379. "Loud speakers." H. J. Round and J. G. Robb. November 28th, 1924. (Cognate applications 3,011/25 and 19,492/25.) (248,433.)

28,916. "Sockets for valves, coils, and the like of wireless instruments." T. B. Braid. December 2nd, 1924. (248,450.)

28,938. "Electrical switches." H. B. Stanton. December 3rd, 1924. (248,451.)

29,009. "Lamp-globe holders." J. Stone & Co., Ltd., and J. F. B. Vidal. December 3rd, 1924. (248,455.)

29,036. "Crystal rectifiers for wireless reception." R. G. McLeod and W. J. McLeod. December 3rd, 1924. (248,459.)

29,087. "Electric couplings." A. E. Chapman and C. R. Cook. December 4th, 1924. (248,464.)

29,103. "Transmission and reproduction of sound." J. T. Day. December 4th, 1924. (248,465.)

29,106. "Electrolytic condensers." Automatic Telephone Manufacturing Co., Ltd., and A. E. Hudd. December 4th, 1924. (248,466.)

29,143. "Variable inductances." M. E. Elliott. December 4th, 1924. (248,469.)

29,187. "Electric measuring instruments and relays." Crompton & Co., Ltd., W. G. Smith, and W. F. Jones. December 5th, 1924. (248,473.)

29,221. "Mounting of electron-discharge devices." N. P. Hinton and Metropolitan-Vickers Electrical Co., Ltd. December 5th, 1924. (248,474.)

29,512. "Variable electric condensers." H. V. Flinn. December 9th, 1924. (248,485.)

29,864. "Combined electric switches and electric couplings." J. A. Crabtree. December 12th, 1924. (Cognate applications 29,965/24 and 22,851/25.) (248,496.)

29,973. "Resistances, rheostats, potentiometers, inductances, and the like used for electrical purposes." A. E. Moore. Decembr 13th, 1924. (248,498.)

30,394. "Apparatus for electromagnetically engaging and disengaging claw couplings for shears, punches, presses, or the like." Deutsche Maschinenfabrik Akt. Ges. January 14th, 1924. (227,811.)

30,507. "Systems of electric motor control." British Thomson-Houston Co., Ltd., R. D. Given, W. J. Pool, and H. W. C. Liddiard. December 18th, 1924. (248,503.)

31,138. "Electric generator." J. W. Tyler. December 29th, 1924. (248,516.)

1925.

399. "Radio receiving apparatus." Sterling Telephone & Electric Co., Ltd., and W. M. Holbeach. January 6th, 1925. (248,522.)

887. "Supports for headphones used in wireless telephony and the like." M. Sutton. January 12th, 1925. (248,527.)

2,545. "Combined condenser and inductance-coil holder for wireless instruments." L. Manning and C. E. Needham & Bro., Ltd. January 29th, 1925. (Cognate application 23,940/25.) (248,535.)

4,890. "Expanding and contracting electric illuminated signs." C. G. White and A. Brooke-Irish. February 21st, 1925. (248,550.)

5,969. "Fine-adjustment devices for electrical instruments." A. R. Taylor. March 4th, 1925. (248,559.)

6,105. "Electric insulators." J. A. Brassington, jun. March 6th, 1925. (248,562.)

6,612. "Construction of tumbler switch." W. J. Charles. March 11th, 1925. (248,567.)

8,574. "Magneto-microphonic relays." C. F. Adolph. March 31st, 1925. (248,581.)

9,844. "Loud speakers." Dr. G. Seibt Fabrik Elektrischer und Mechanischer Apparate. June 16th, 1924. (235,529.)

10,048. "Automatic stopping devices for electric lifts." Smith, Major and Stevens, Ltd., and P. H. Stevens. April 17th, 1925. (248,588.)

10,243. "Leading-in tube combined with throw-over switch contacts and spark-gap for use with wireless or other electrical apparatus connected to overhead aerials." P. J. Ambrose. April 20th, 1925. (248,590.)

12,673. "Aerials for use with wireless receiving apparatus." J. W. Hyde. May 15th, 1925. (248,597.)

12,750. "Insulating blocks for electric heaters, resistances, and like apparatus." W. F. Jackson and G. Bray & Co., Ltd. May 15th, 1925. (248,598.)

14,214. "Electron-discharge valves." Compagnie Générale de Télégraphie Sans Fil. June 2nd, 1924. (234,844.)

14,455. "Telephone receiver rests." W. H. King. July 8th, 1925. (248,609.)

15,549. "Illuminated advertisement machine." E. A. Vardy. June 16th, 1925. (248,614.)

15,735. "Electric connectors." F. Kniveton. June 17th, 1925. (248,616.)

19,351. "Multi-filament incandescent lamp." S. Rendes. July 30th, 1925. (248,631.)

21,670. "Variable electric condenser." S. Cohen. August 29th, 1925. (248,647.)

21,940. "Speed-regulating device for electric elevators." Waygood-Otis, Ltd. June 18th, 1924. (Divided application on 235,858.) (239,515.)

23,028. "Electrodes for thermionic valves." A. Emerson, jun. September 3rd, 1925. (248,648.)

22,445. "Immovable electrolyte for dry cells." Compagnie Francaise pour l'Exploitation des Procédés Thomson-Houston. September 8th, 1924. (239,547.)

23,210. "Electron discharge devices." British Thomson-Houston Co., Ltd. September 17th, 1924. (240,166.)

24,500. "Electron discharge devices." British Thomson-Houston Co., Ltd. October 1st, 1924. (240,850.)

24,675. "Automatic reduction gear couplings for combined electric starters and dynamos for motor vehicles." P. Dufour. October 4th, 1924. (240,865.)

24,998. "Electrical condensers." Dubilier Condenser Co. (1925), Ltd. October 7th, 1924. (241,200.)

25,133. "Multiple or combination electric switches." A. H. Midgley and Auto Sundries, Ltd. October 8th, 1924. (248,661.)

25,248. "Electron discharge apparatus." British Thomson-Houston Co., Ltd. October 9th, 1924. (241,216.)

25,549. "Thermionic discharge devices." Westinghouse Electric & Manufacturing Co. October 14th, 1924. (241,556.)

26,698. "Arc-light high-frequency oscillation generators." C. Lorenz Akt. Ges. February 15th, 1925. (247,517.)

26,781. "Overload time-lag protective arrangements for electric circuits." J. W. Kirkland (Allgemeine Elektricitats Ges.). October 26th, 1925. (248,669.)

26,796. "Electric motor-driven change-speed device." E. C. R. Marks (Hendey Machine Co.). October 26th, 1925. (Addition to 239,395.) (248,670.)

28,305. "Surface condensers." International General Electric Co., Inc. November 10th, 1924. (242,677.)

30,112. "Gasfilled electric lamps." General Electric Co., Ltd. March 18th, 1925. (248,680.)

32,757. "Movable headlights for vehicles." J. W. Reynolds. December 28th, 1925. (248,685.)

1926.

3,632. "Electric couplings." A. E. Chapman and C. R. Cook. December 4th, 1924. (Divided application on 248,464.) (248,692.)

The

Electrical Review

VOL. XCVIII. APRIL 9 1926. No. 2,524.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Industrial Lighting Reflectors.

WHILST there is general recognition of the continual progress that is being made in lighting, one recent development—the tendency towards standardisation—deserves special notice. It marks a new stage in illuminating engineering. Lighting is in many respects a very difficult field for standardisation. In the case of most problems, there are many different aspects to consider, and as new lamps and appliances are being constantly introduced, the whole subject is in a state of continual development.

There are, however, some directions in which standardisation would obviously be beneficial. Several of these were indicated at the recent meeting of the Illuminating Engineering Society, when the B.E.S.A. specifications for portable photometers (No. 230/25) and industrial reflector fittings for electric lighting (No. 232/26) were discussed. The former specification should have the effect of materially raising the standard of accuracy and workmanship of photometers; the latter is of particular value as showing the willingness of leading manufacturers of reflectors to adopt standard principles of design.

Discussion of the last-mentioned was concerned mainly with its leading feature—the adoption of an "angle of cut-off" of 20 deg. for reflectors of the enamelled-iron "R.L.M." type. The Home Office Departmental Committee on Lighting in Factories and Workshops has already recommended that, with a view to avoiding glare, the angle between the line drawn from the eye of the operator to the filament and a horizontal plane should not be less than 20 deg. (except in the case of sources within six feet of the operator, where an angle of 30 deg. is specified). Reflectors with an angle of cut-off of 20 deg. could therefore be used in practically any position in a factory without fear that the conditions would be unduly glaring. This is obviously a great advantage. The Home Office Committee made it clear that its requirements could be met in various ways—for example, even very shallow reflectors can be used if located at a sufficient height so as to be out of the direct range of vision. But a user of the standardised R.L.M. reflector would know that he was taking no risks.

One fact brought out very clearly in this discussion, but not sufficiently generally realised, is that angle of cut-off and efficiency are closely related. The more completely the flux of light from a lamp is enclosed by the reflecting source the greater in all probability will be the loss of light. The general opinion seems to be that

enamelled-iron reflectors of this type with a cut-off angle of 20 deg. should have an efficiency of the order of 60 to 65 per cent. Estimates of efficiency of industrial reflectors are apt to be somewhat fanciful; there are certainly very many reflectors in use with an efficiency very much less than the value mentioned above.

The term "efficiency" is often abused. Here is a striking case in which the more "efficient" apparatus is not necessarily the more serviceable. If, for example, one imagines a reflector consisting of a flat disk a comparatively long way above the lamp, intercepting only a small fraction of the light rays, it is apparent that it might have an efficiency of nearly 100 per cent.—simply because it is inactive, and discharges none of the functions of a proper reflector. British manufacturers will do well to continue to aim at the production of reflectors with suitable screening properties and a cut-off angle of at least 20 deg., even though this may occasion some sacrifice of nominal efficiency.

Whilst this specification relates primarily to one particular standard form of fitting—the enamelled-iron reflector of the R.L.M. type—it should be understood that there are other possible methods of eliminating the glare, for instance, by the use of opaque or translucent rings so placed as to screen the source at all angles likely to bring it within the range of vision. By these and other methods sufficient protection against glare, coupled with higher efficiency and desirable properties as regards very extensive distribution of light, may be obtained, and a promising form of fitting of this type was exhibited at the meeting of the Illuminating Engineering Society. The specification, therefore, should not operate as a bar to progress, and may require revision from time to time.

One other point of great importance requires to be noted—the necessity for standardisation of lamps in order that they may give predetermined results in standardised reflectors. In the past much trouble has been caused by variations in the dimensions of lamps of the same wattage. In some cases the dimensions were such that the filament came too far within the reflector; in other cases the filament projected right outside the reflector, giving rise to glare. In either case the expected distribution of light from the reflector would not be obtained, and hence the predetermined conditions of illumination would not be realised.

In order that reflectors designed in accordance with the specification may operate properly, it is of great importance that the position of the centre of the filament with respect to the cap of the lamp should be standardised so that the light source will be located as nearly as possible always in the same place within the reflector. Excellent progress has already been made by the B.E.S.A. Lamp Committee in the direction of standardisation, and lamp manufacturers will no doubt co-operate in the fixing of limits which will ensure yet greater precision in the future.

The Training of Electrical Power Engineers.

Whilst the Electrical Power Engineers' Association in its earlier years devoted its attention mainly, and with ample justification, to securing reasonable remuneration for its members, it has always been proclaimed by the leaders of the Association that it had higher aims—namely, to raise the status of power engineers and, to that end, to improve the training of recruits to their ranks. In this resolve it has enlisted the sympathy and support of the Employers' Side of the National Joint Board, and a scheme drawn up by that Board has been under consideration by the District Joint Boards for some time. We have now received a copy of the scheme as approved by the N.J.B. and recommended for adoption by the District Boards and supply undertakings.

In a brief introduction it is pointed out that modern systems of supply are so complex that the engineers who supervise their operation and maintenance must needs be highly trained; they are responsible for very costly plant, for the continuity of supply, and for heavy outlay, demanding technical knowledge of considerable extent, and the scheme is designed to ensure their possession of the necessary qualifications. A Register of trained engineers is to be established, recording the names of men who have been suitably trained, but there is no intention of restricting employment to those on it.

The National and District Joint Boards will not attempt to supervise the course of training until the men who have completed an approved course in engineering works present themselves for admission to the electricity supply industry, but they will appoint sub-committees to collaborate with the firms concerned and with technical colleges, and to keep in touch with the progress of the trainees during their training within the supply industry and afterwards. The preliminary training involves three or four years spent in a manufacturing engineering works, unless the candidate follows a three-year day course at a technical college or university, in which case the works training may be reduced to two years; and the two years' training within the industry must be spent in an undertaking having not less than 8,000 kW of plant installed. The total period of training in any case must extend over six years, and the candidate must pass a test for proficiency, which may be the A.M.I.E.E. or other approved examination.

The scheme as a whole is commendably brief, practical, and businesslike, and should prove effective in removing the uncertainty which has hitherto surrounded the question of training for the electricity supply industry and in placing it on a higher plane. We are specially pleased to see that it is regarded as essential that the engineer shall possess a knowledge of the commercial side of the industry. The want of this qualification has been a heavy handicap to the industry in the past, and if electricity supply is to be developed as it should be, it is imperatively necessary to include adequate commercial training in the curriculum.

The Electricity (Supply) Bill.

That the Bill would be given a second reading by the House of Commons was a foregone conclusion. The debate, which occupied two days, was in many respects interesting; the Bill was praised for widely different reasons, and no less diverse were the arguments advanced in opposition to its progress, some of which, as was pointed out at the time, were mutually destructive. At this stage, of course, the broad principles embodied in the Bill were alone in question, the details being a matter for the Standing Committee. A brief report of the debate is concluded in this issue.

Unfortunately, as might be expected from the nature of the subject and want of acquaintance with its intricacies on the part of the speakers, misconception of the situation and misinformation as to the actual facts largely detracted from the value of the discussion. Not a little of the latter was due to the Weir Committee's report; in the course of the Attorney-General's closing speech, for example, he made use of a table from the Report purporting to compare the consumption of electricity in this country with that in eleven places abroad, of which only one was truly comparable and relevant. No wonder that such figures were stigmatised by a member as "deliberately misleading"!

It would be tedious to review the debate at length, but we may sum up the result in a few words: a Bill of some kind is essential to repair the damage done by the House of Lords to the Bill of 1919; this Bill is not satisfactory, but can be greatly improved in Committee; when all is said and done, it will not give cheap electricity to everybody—distribution still remains as costly as ever; and, what is of the first importance, progress is being brought to a standstill whilst the electricity supply industry, including the Electricity Commission, awaits the verdict of Parliament. Since the autumn of 1924 numerous schemes of local development received by the Commissioners, and certain schemes devised by them, have had "necessarily to be deferred pending a decision by the new Government as to the policy to be followed. The brake is on all the time—and the slow progress resulting from its application is used as an argument against the industry!

Electrical Progress in Pretoria.

The New Municipal Generating Station.

The first electricity supply installation in Pretoria, which was established in 1891, consisted of five belt-driven generators, and it is interesting to record that Mr. T. C. Wolley-Dod, the present electrical engineer to the Town Council, assisted in the transportation of these units by ox wagons. Within ten years the output of the station had increased to six times that of the original demand, and between 1891 and 1919 the station was reconstructed three times on the original site; and in 1902 it was taken over by the Municipality. Subsequently Mr. G. M. Clark, M.A., M.Inst.C.E., who was appointed as consulting engineer to the undertaking, decided that it was necessary to build a completely new power house equipped with turbine-driven generating plant. A site, convenient for coal and water supplies, was chosen some three miles from the centre of the city, and it was proposed that the new station should be designed for an initial output of 10,000 kW, and that the original station (Schoeman Street) should be used as a converter station and equipped with five 750-kW motor converters. The new station, fig. 1, stands 4,360 ft. above the sea level.

Fig. 1.—Pretoria Generating Station.

The first work to be put in hand was the construction of a dam, by which it was possible to store 100 million gallons of water, with a top-water surface of 35 acres, for cooling the circulating water by natural evaporation.

The power station is of reinforced-concrete monolithic structure, and all the stresses are carried on beams and columns; the foundations are taken direct on to the rocky shale, the bases of the concrete columns being carried to this solid foundation. An important feature in the construction of the building is the provision of large windows on all sides, freely admitting natural light to the semi-basement engine room. The boiler and engine rooms and all the machinery are on the same level, which was determined by the minimum water level to be anticipated in the dam.

The boiler equipment consists of six Babcock and Wilcox marine-type boilers, fig. 5, with electrically-driven chain stokers. Each boiler has a normal capacity of 20,000 lb. per hour, and is fitted with a steel-tube economiser with a main flue above. The chimney stacks are 7 ft. 6 in. in diameter, and are fitted with induced-draught fans. Coal is brought to the sidings in hopper-bottomed trucks, the largest of which is capable of a load of 50 short tons (2,000 lb.). It is belt conveyed to bucket elevators, from which a second conveyor discharges it into overhead steel bunkers, whence it travels, *via* chutes, to the boilers. At the top of each chute is a coal valve which discharges 700 lb. at each filling. About 100 tons of coal is kept in the overhead bunkers, and provision is made for storing and handling up to 3,000 tons on site.

The pump room lies between the engine room and boiler house, and Weir feed pumps, 6,000 r.p.m., are installed, each having a capacity of 7,000 gal. per hour against full pressure. The boiler feed water is taken into drums, from which it is distributed to either or both of the duplicate feed ranges; and a motor air compressor supplies air to all parts of the station for various purposes, including soot blowing from the boiler tubes.

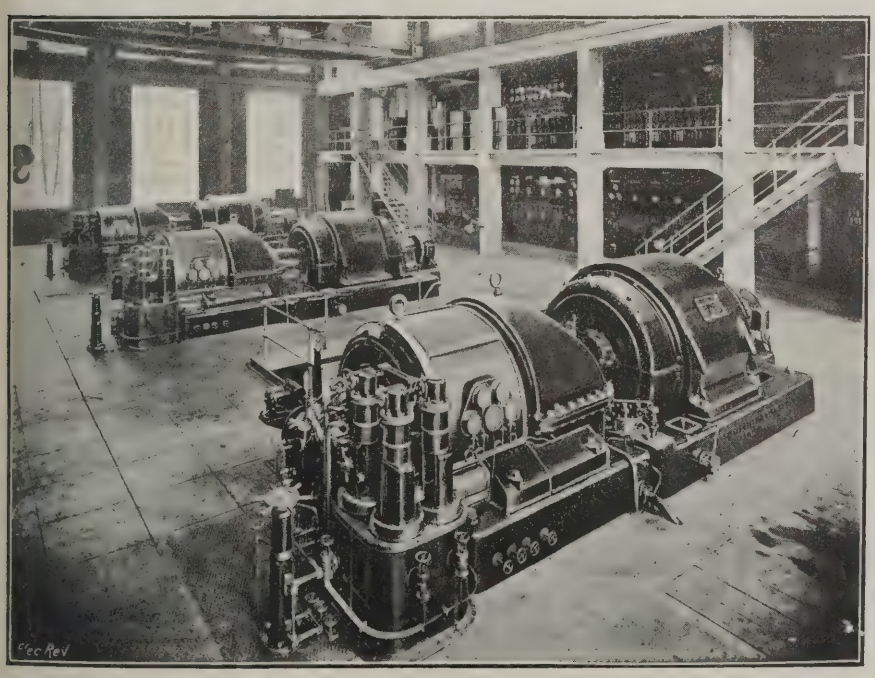

Fig. 2.—Turbine Room.

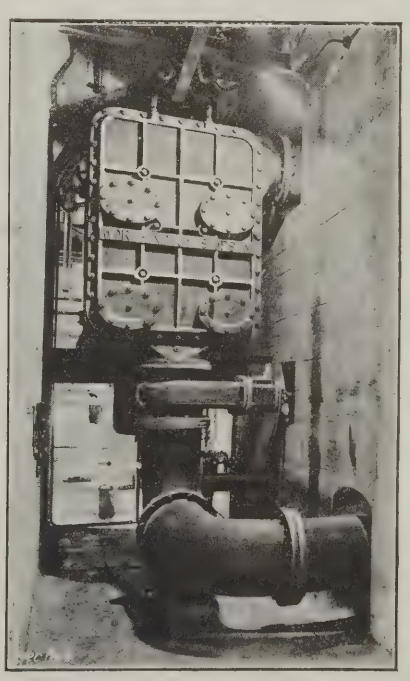

Fig. 3.—6,000-sq. ft. Condenser.

The turbine room, fig. 2, is equipped with three 3,500-kVA, General Electric Co., Ltd., turbo-alternators, running at 3,000 r.p.m., the turbines being of the impulse type designed for a working steam pressure of 350 lb. per sq. in. gauge, with a total temperature of 600 deg. F., and a 95 per cent. vacuum. The steam supply to each turbine is controlled by three throttle valves automatically operated by the governor through oil relays.

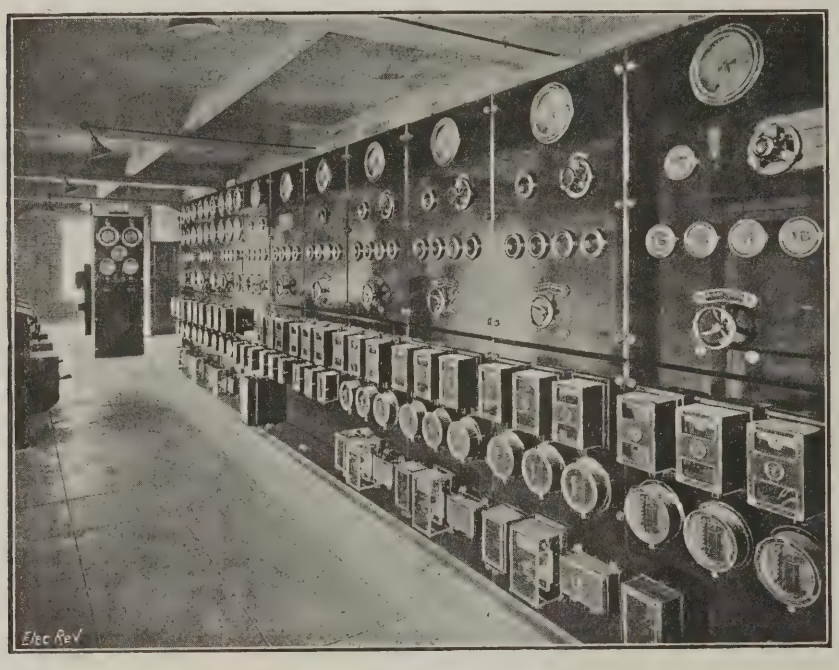

Fig. 4.—6,600-V Cubicle Board.

The first or main throttle valve, which is housed in a separate steam chest, enables the machine to carry ¾ load. The other two carry full load and 5/4 load respectively, and are arranged together in a second steam chest. The steam from the chests enters the steam belt in the high-pressure casing, where expansion nozzles are fixed in the bottom half only. The steam belt of the bottom half casing is closed at the horizontal joint, so that none of the joints, which have periodically to be broken for inspection purposes, are subject to live steam pressure. Worthington-Simpson condensers, fig. 3, are installed, each with a cooling surface of 6,000 sq. ft. The circulating pumps are driven by "Witton" motors, each of which is started by an auto-transformer starter, an oil circuit breaker being also provided for the main control.

The alternators are of the G.E.C. standard type generating at 3-phase, 50 cycles, 6,600 V, and were designed for an 80 per cent. power factor. The ventilation of these machines is such that the air which cools the rotor is kept apart from that which cools the stator during their passage through the machine.

The switchgear, also supplied by the G.E.C., Ltd., is divided into three main sections, a 6,600-V stonework cubicle board, fig. 4, with electrically-operated oil circuit breakers; a steel-plate, slate-front, cubicle board for the 500-V supply for the auxiliaries and lighting; and the auto-transformer starting panels for the auxiliary motors. The control board for the h.p. gear, equipped with the usual modern apparatus, including protective relays, is on a gallery overlooking the engine room, while the steel-plate cubicle board is immediately below. The stonework cells for the oil circuit breakers, links, and instrument transformers are in a room immediately behind the 500-V board and on the same level. The bus-bar cells are situated behind the control board. Three main generator cubicles, one containing a bus-bar coupler, two works cubicles, and three 2,200-kVA feeder panels, accommodate the h.p. switchgear. A duplicate bus-bar system with duplicate links is installed, both sets of links being mounted on the oil circuit breaker side of the cubicle so as to facilitate inspection. The circuit breakers have a maximum breaking capacity of 125,000 kVA, and each phase contact is contained in a separate tank, having a rupturing speed of at least 5 ft. per sec. A coloured-light indicator shows the position of each breaker, "on" or "off." The 500-V board consists of ten panels in all, seven of which control the works supply. The remaining three are a 50-kVA lighting panel; a 50-kVA panel for a charging set; and a busbar disconnecting panel.

It is interesting to note that at the old generating station there is an electrically-operated stonework cubicle system, which is a duplicate of that at the new power house, except that there are four feeder panels, a busbar panel, and five panels for controlling the high-pressure side of the motor-converters. Also in the eight other municipal sub-stations there are installed G.E.C. truck-type cubicle switchboards for the high-pressure circuits, comprising in all some 30 trucks.

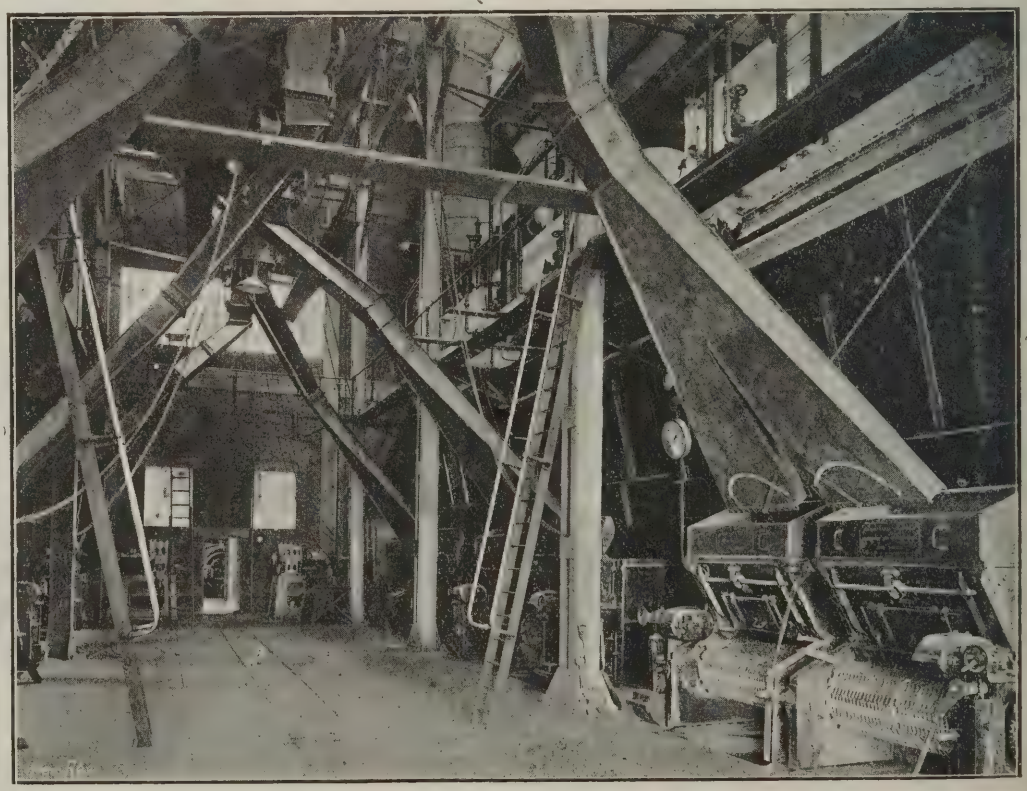

Fig. 5.—The Boiler House.

In the main power house there is installed a petrol engine coupled by belt to a combination machine, which

can be used for battery charging or reversed to supply a.c., while in the event of a shut-down it provides a means for starting the auxiliary motors.

The present output of the station is approximately 1,250,000 kWh per month; the maximum load amounts to 4,050 kW; and the load factor is about 40 per cent. Underground cables transmit the energy to the old power station. Two pairs of cables form a ring main to supply a.c. energy at various points of the western end of the city, while a third cable forms a diameter to the ring and runs direct to the old station. The eastern end of the city is supplied by a second ring from the Schoeman Street station.

The total cost of the station was £250,000, exclusive of the dam and the site. This gives a figure of £25 per kW, of which 10 per cent. was absorbed by transport costs. A further £75,000 was spent on the converter station and mains. These costs are based on 1921 prices. As an indication of the wide use made of electricity in Pretoria, the consumption per head of the white population is about 300 kWh per annum.

Agricultural Electrical Machinery.

Some Features of the Paris Agricultural Exhibition.

By R. BORLASE MATTHEWS, Wh.Ex., A.M.Inst.C.E., M.I.E.E., F.R.Ae.S.

This annual Paris exhibition of agricultural machinery increases in size each year and affords a most interesting illustration of the machinery employed by the French farmer, much of which is radically different in detail from that utilised in England. This year the machinery shown in operation was worked by electric motors, and naturally the stands were electrically lighted. The electric motor in itself is no longer considered to be a novelty, but rather an accepted feature of such an exhibition, and owing to its compactness, it is incorporated as an almost obscure part of many machines. French agricultural electric motors are nearly all of the industrial type, for unlike the special farm motors in use in Germany and Scandinavia, no pains seem to be taken to make them dust-proof. While many of the machines are directly driven with individual motors, there is apparently a very large demand for portable motors mounted on wheeled barrows of various styles. These barrows, without exception, are equipped with a countershaft fitted with several pulleys of different diameters, and the endless belt, connecting the motor to this countershaft, is maintained at the proper tension by a counterweighted jockey pulley. The use of such a pulley also ensures a longer surface of belt contact. The motor starter and a drum for the flexible cable are mounted on the same barrow.

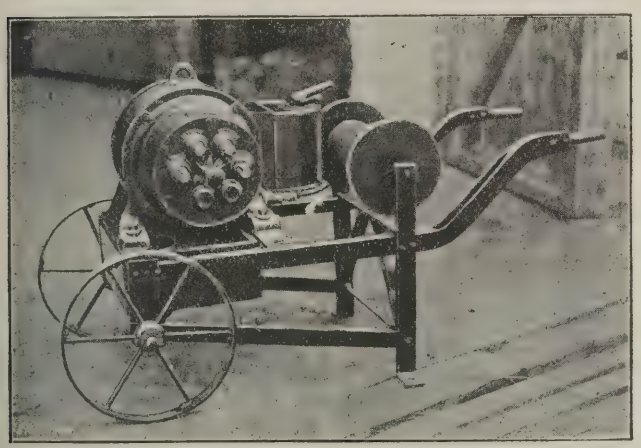

Fig. 1.—The "Law" Motor.

Progress has been made with self-contained geared motors; in fact, in one type, the electric motor has become an accessory which is bolted to the side of the gear box, holes for foundation bolts being provided on the latter. To avoid the trouble of alignment with the various machines that have to be operated, tubular shafts some six or eight feet in length are provided, the ends of which are fitted with Hooke joints; thus the geared motor can be conveniently placed on the floor to drive a machine whose axle is two to three feet above the ground level. Several spindles project from the gear case, fig. 1, each of which is arranged to run at a different speed (say 40, 60, 100, and 200 r.p.m.). The curves (fig. 2) show the advantages of this class of motor, known as the "Law." Figs, 3, 4, and 5 illustrate some of the applications of the machine.

Among the electric thrasher machines, a particularly interesting motor was the Dassenoy, which runs at 3,000 r.p.m.—an unusually high speed for electric-motor drives—and has a sliding armature which facilitates the starting. This method of starting permits the use of a smaller motor than would normally be employed, as it is unnecesary to start on load. Motors of this type are often equipped with a so-called hour meter; really, of course, it is a revolution counter which records the revolutions in units of the hourly number. In this form, the motor is used by French farmers' co-operative societies, and the hire charge to their members is based on the hours indicated on the counter. For these machines the makers claim a better power factor, negligible slip, and a 10 per cent. reduction in consumption for the same work done by motors of the usual type. The motor is also made to run at 1,500, 1,000, and 750 r.p.m.; the standard sizes vary from two to fifteen horsepower.

During recent years, the Ford Motor Co., in order to develop the sales of the Fordson agricultural tractor, have expended a great deal of time and energy in working out various applications of their machine, including farm uses, building operations, and road construction and transport. The manner in which this work has been carried out is a very good object-lesson in the application of the electric motor to farm purposes.

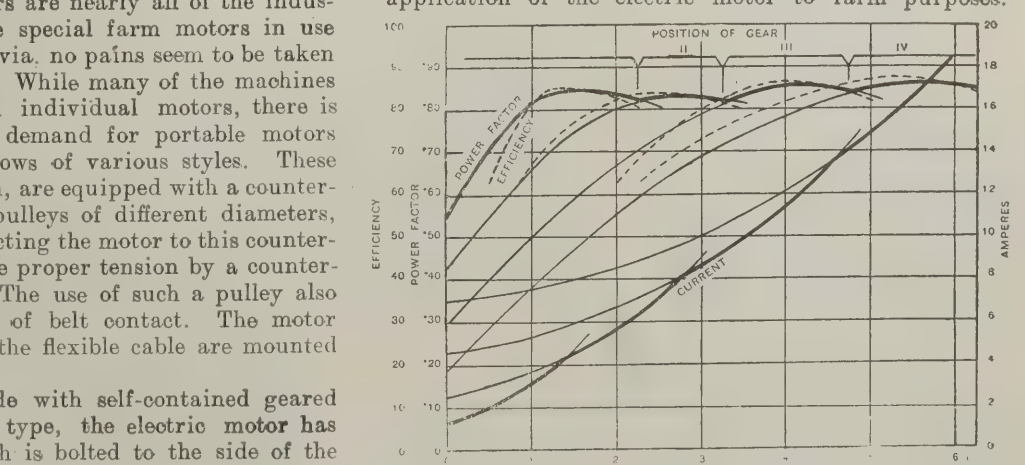

Fig. 2.—Comparison Curves for Geared Motor.

The latest development of Fordson tractor applications is the incorporation of a dynamo. This is accomplished by placing a special cast-steel bracket below and in front of the radiator. The generator is directly connected to the crankshaft at the point where the starting

handle is usually placed. Thus among the numerous duties of the Fordson tractor is now added that of charging the lighting batteries on a farm when required and when the tractor is not employed on other farm work.

On the Continent the mechanical cultivation of vineyards is becoming more and more important, and in this connection a very ingenious plough, somewhat humorously described by the exhibitor as "an intelligent implement," was exhibited. It is provided with a guide in front, which, on coming in contact with any vine stems, momentarily diverts the plough share which follows, thus avoiding any damage to the vine roots. This implement is driven by a Julien & Prat electric motor mounted at the end of a multigear box which gives the choice of special speeds; the final drive is effected by means of an endless belt with a solid cast-iron idler pulley riding upon it to maintain a uniform tension and also to neutralise any shocks, due to stones and such obstacles encountered in the soil which is being ploughed. Though no electric ploughs for ordinary farm work were exhibited, there were several working models; fig. 7 shows an electric plough tractor.

One of the difficulties in operating tractors on the land is that of maintaining a sufficient grip on the soil; almost innumerable types of spuds, strakes, and other non-slipping attachments have been tried, and the latest development is that of the Guerrini "pedorail" chain attachment. This device provides chains which can be mounted over twin rubber tires or pneumatic tires, or else direct on to steel rims. The chain carries a series of eleven feet, mounted on bearings on which the feet can oscillate slightly, enabling two of

Fig. 4.—The "Law" Motor Crushing Corn.

the feet to come in contact with the ground at the same time, thus very greatly improving adhesion, especially on soft ground. While apparently quite satisfactory for slow speeds, such as those of agricultural tractors, the device is not suitable and is too noisy for the higher speeds of lorries, though it is employed by the French War Department for temporary attachment when a lorry has to travel over very rough or very soft soils.

The Renault Motor Co. showed a 20/40-h.p. oil engine driving a 220/127-V, 79-A, 3-phase alternator, running at 1,500 r.p.m., with a 50-V, 20-A exciter. The alternator and exciter were made by the Société Alsacienne de Constructions Mécaniques, Belfort. This type of plant is intended for temporary use in a district pending the construction of overhead supply lines.

The Diluvien automatic watering machine was on view. This consists of a motor-driven pump mounted on a small wagon which progresses automatically. The water is distributed by means of two arms which carry roses at intervals for spraying the water. The apparatus is intended particularly for the use of market gardeners. It will water, it is claimed, a surface of 3,000 to 6,000 sq. yds. per hour and distribute about 7,000 gallons of water during that time. The machine is fitted with a $2\frac{1}{2}$-h.p. motor, and the pump runs on a permanent rail track laid down the centre of the ground that is to be watered. The automatic watering of crops is becoming of more importance, not only to the market gardener but also to the farmer, hence all developments of this nature are well worthy of study.

A new development in self-contained geared motors for the French market is a high-speed motor, 3,000 r.p.m., which follows the lines of some German designs,

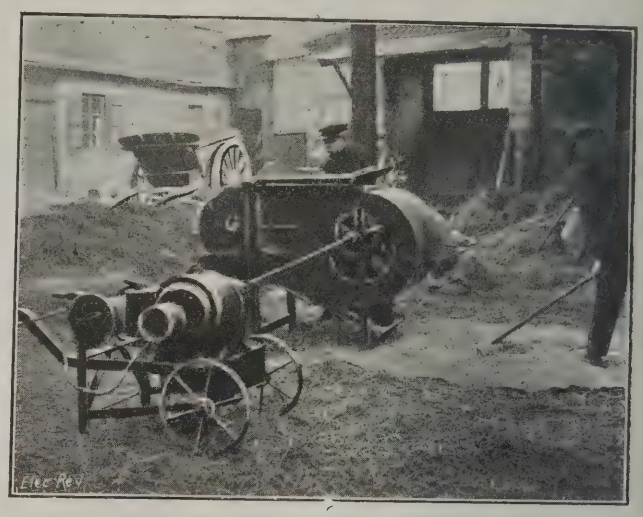

Fig. 3.—Driving a Winnowing Machine.

of one-half to two horse-power. This makes an exceedingly compact machine. It is fitted with a double-reduction gear and drives at one speed only. For the sake of portability a convenient handle is incorporated. A switch is counter-sunk into the motor frame so as to be readily accessible and yet not easily damaged. The connection between the shaft or motor gear box and the machine to be driven incorporates a triple Hooke joint. A tripod stand supports the motor (fig. 6), and it is considerably more stable than the machines employed in other countries, which in practical use are inclined to wobble about. The stability is due to the final adjustment being effected by a sliding vertical tubular support above the tripod.

Among the English firms which exhibited were:—Ransomes, Sims & Jefferies, Ltd.; Ruston & Hornsby, Ltd.; Marshalls; Campbell Gas Engine Co.; and Bamfords.

In the general exhibits of electrical equipment for farm buildings, one was struck with the great variety of applications and the choice of methods of accomplishing each. Taking water pumping as an example, there must have been over forty different designs of pumps on show. The general trend seems to be towards automatic pumps of small horse-power, which provide a high-pressure delivery and yet are of simple design and reasonable cost. The air-pressure tank seems to be falling out of favour, its place being taken by a small cistern, mounted at a considerable height, to provide

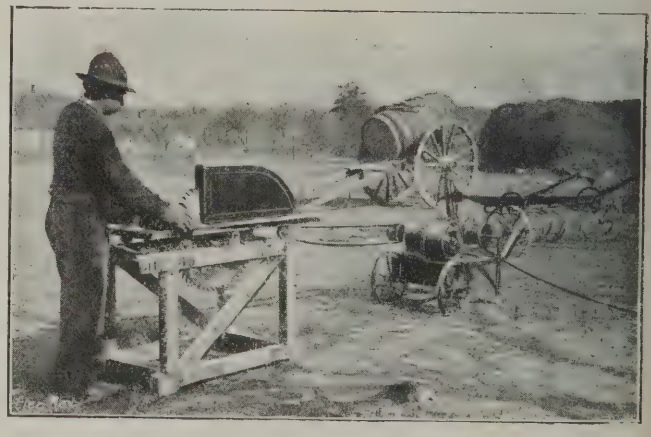

Fig. 5.—Driving a Saw Mill.

the required head. One very good form of float control that was noticed, made by the Société Générale Agricole, consisted of a metal arched tube containing a small quantity of mercury. When the control is operated, by the limits of the change of level of the water, the over-

balancing or spilling of the mercury in the curved tube takes place with less friction than that of a roller weight, hence the switch is operated more positively. There were a great many modern variations of the *chaine hélice* pump on view. In the case of centrifugal pumps, base-plates are often now eliminated; this is accomplished by designing the pump casing as a part of the motor end frame—provision being made for an accessible stuffing box. This makes a very simple, cheap and neat design.

Fig. 6.—Portable Motor on Tripod.

As to washing machines, there are a great many makes from which to choose. The general construction is of such a type that they can be sold at lower prices than those on the British market. Fig. 8 shows a very popular design of this form of machine. It will be observed that galvanised sheet steel is largely used in their construction. One French motor manufacturer is marketing a fractional horse-power electric motor combined with a worm reduction and automatic reversing gear, in one complete unit. This is adaptable for the driving of any horizontal drum type washer. The automatic reversing gear is essential for operating drum-type washers, for the clothes that are being washed would otherwise get too closely pressed or wound together to become properly cleansed.

Fig. 8.—Electric Drive for Washing Machine.

Several working examples of milking machines were on view. A feature of the Alfa-Laval machines is the use of rubber tubing which has extremely smooth interior surfaces, thus avoiding resting places for deleterious bacteria. A Danish machine—the Dana—now largely used in France, employs a new principle in milking-machine design, for its valves are operated by the milk as it is drawn from the cow. This feature enables the cows to be milked quite dry—an operation which, it is claimed, no other machine accomplishes, it being usually necessary after the milking machines are removed for the cow to be "stripped." Further, the "strippings" contain a big percentage of cream, and also if they are not drawn off properly, the cow diminishes her supply of milk at subsequent milkings. Of course, the vacuum pumps of these milking machines could be operated by oil engines, but in practice the farmers appreciate the self-contained electric unit, as the cow is very sensitive to any change in the regularity of the pulsations, reducing her supply of milk if they are erratic.

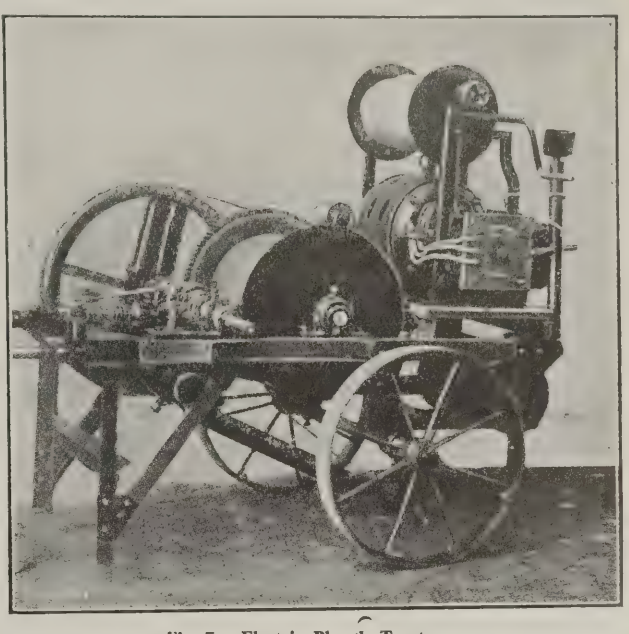

Fig. 7.—Electric Plough Tractor.

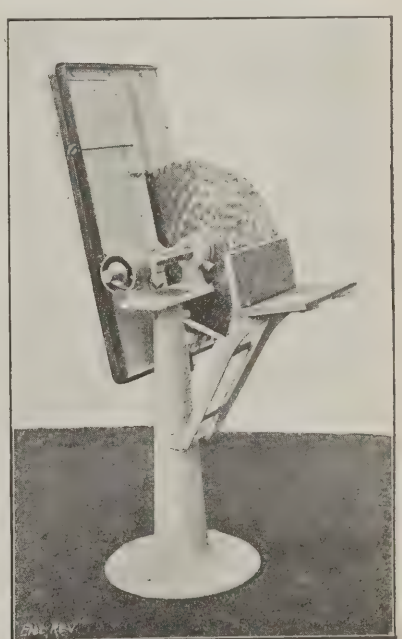

Fig. 9.—Tilting-Table Machine.

An important problem on every farm is the transport of material. On the Continent and in America to-day there is a marked tendency to install overhead transporters of various kinds, and in modern British cow houses the overhead runway is becoming familiar; but the electrically-operated transporter gear is almost unknown here. Several examples of these were on view at the exhibition. They might be briefly described as simple modifications of the well-known Temperley coal transporters, adapted to agricultural conditions and farm limitations of capital costs.

On every farm, a circular saw is a most convenient tool. In France it has developed in a most useful way, many of the machines being adapted to serve for both log and firewood, and also for ordinary odd-job work. This is accomplished by the aid of a tilting table or bascule, fig. 9. There can be no doubt that firewood sawing is made much safer when the wood is firmly supported in double Y-arms, as is done in these double-purpose machines.

Electrically-driven cross-cut log saws have been on the market for some time, and have proved their utility. A new development which was shown at Paris is an electric portable horizontal saw, made by the Société Générale Agricole, for cutting down standing trees. As the result of practical experience, the circular saws used for this purpose are made with four sets of three special teeth. The first two of each set are clearing points of semi-circular shape, while the third is of the usual shape. This same tool can also be used for other circular-saw work when a circular saw of the normal type is substituted, for the power transmission is through two different bevel drives, and that the gear-box casings are arranged for turning at any convenient angle to suit the work in hand.

It will be appreciated from the foregoing remarks that steady progress is being made in the development of new electrically-operated apparatus for the farmer and rural dweller in France. Continental farm labourers are not as a rule so intelligent as the British farm hands, and when electrical distribution in this country reaches the stage it now occupies in many parts of the Continent, we may anticipate an extended use of even more ingenious labour-aiding (a preferred expression to labour-saving) machinery, over the country-side.

Three-Phase Four-Wire Metering.

Comparative Performances of Four Types of Equipment.

By GEO. D. MALCOLM.

In my previous article on the metering of three-phase power,* I confined my remarks to three-wire industrial practice, and endeavoured to prove that the three-wire unbalanced-load meter was the most satisfactory medium for that purpose. The metering of a 3-phase 4-wire supply, which may include under one service 3-phase motors, single-phase motors, and perhaps heating—if the tariff permits—is, however, quite another proposition, and requires a different solution.

Supply authorities generally insist on large lighting installations being separated, and the load more or less equally balanced between the three phases; so once again the question of how best to deal with this form of supply is presented.

One, or even two, of the phases may be temporarily disconnected for some reason or other; one single-phase motor, one radiator, or one small section of lighting may constitute the total load at some period; one 3-phase motor may be in commision alone; a considerable amount of "out-of-balance" may be caused by groups of single-phase units being on load simultaneously; and so on. The combinations of possible conditions are many, and the metering equipment installed should be capable of integrating accurately under all of them.

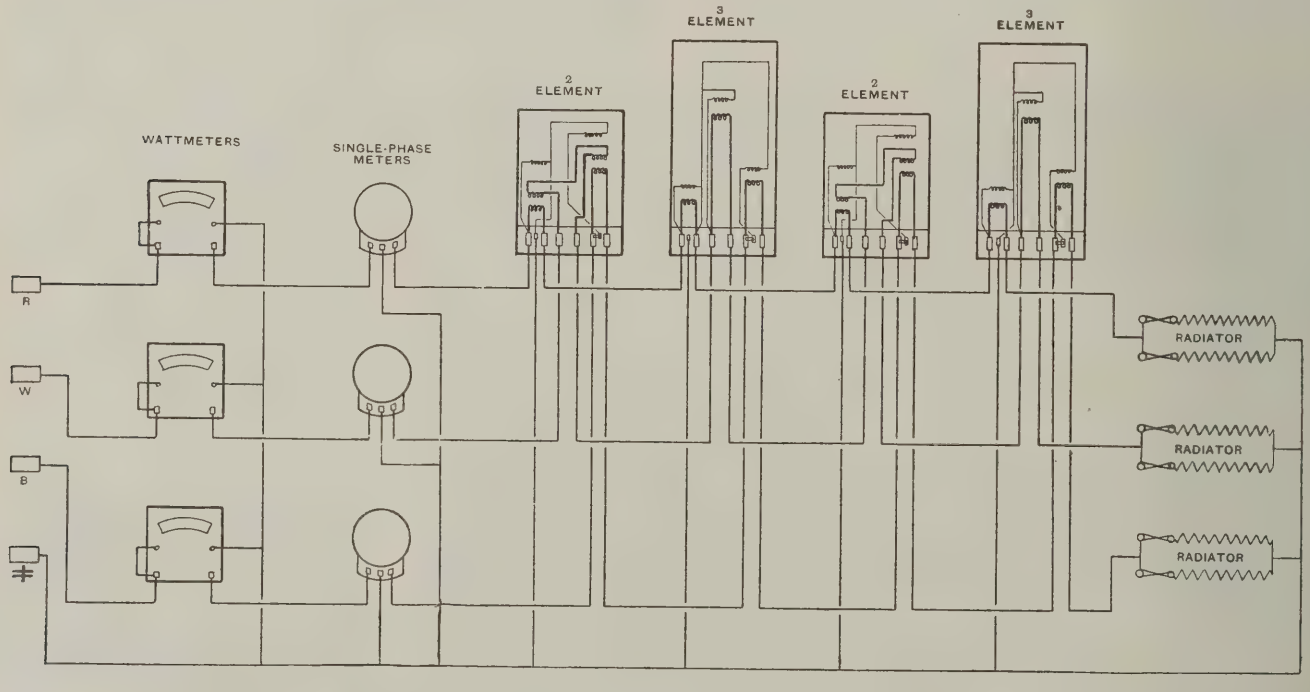
*Electrical Review, October 30th, 1925, p. 689.

There are two methods which may be employed, *viz.*:—

(1) Three single-phase meters.

(2) One 3-phase 4-wire unbalanced load meter.

The latter method may be again sub-divided into:—



(1) 3-phase 4-wire two element type meter;

(2) 3-phase 4-wire three element type meter (2 rotors);

(3) 3-phase 4-wire three element type meter (3 rotors);

and it is the relative performances of these three types of polyphase meters which present the most interesting features.

Opinions still differ on this point; and whilst some manufacturers state that the 2-element type meter will cope with all conditions likely to arise, others hold that the 3-element, 3-rotor type meter is the only correct type for the task. The experience of supply engineers who have been called upon to deal with this class of supply also seems to vary, and it is hoped, therefore, that the results of tests recently made will be of passing interest to both groups.

Comparisons were made to ascertain which of the following four systems of metering would produce the most accurate record of the consumption on non-inductive and inductive 3-phase 4-wire installations, under normal and abnormal conditions, the equipments employed being:—

System No. 1.—Three single-phase meters.

System No. 2.—One 3-phase 4-wire 2-element polyphase meter.

System No. 3.—One 3-phase 4-wire 3-element polyphase meter (2 rotors).

System No. 4.—One 3-phase 4-wire 3-element polyphase meter (3 rotors).

The tests were carried out "on circuit" under practical service conditions, the meters having been carefully checked in the test room before being installed.

As in the previous series of tests, three 2-element radiators, each controlled by two switches, were utilised to provide the non-inductive loads; but in this case one terminal of each radiator was connected to the neutral of the system, as shown in fig. 1. Various combinations of circuits and irregularities were reproduced, and tests taken on all meters under each condition. The results obtained, reduced to a percentage basis to facilitate comparison, are set out in Table I, column 2 of which indicates the state of balance existing at the time of each test.

TABLE I.

Units chargeable in respect of 3-phase, 4-wire, non-inductive load under four systems of metering.

System No. 1.—Three single-phase meters.
System No. 2.—One 3-phase, 4-wire, 2-element polyphase meter.
System No. 3.—One 3-phase, 4-wire, 3-element polyphase meter (2 rotors).
System No. 4.—One 3-phase, 4-wire, 3-element polyphase meter (3 rotors).

Neutral ,, ,, ...	2	2	2	,,	102	96	99	102

For the purpose of the inductive series of tests, the radiators were replaced by three choke coils. The figures tabulated in Table II represent, therefore, what might be expected—at some time or another—under industrial conditions, and provide data upon which the choice of the most reliable and straightforward system of metering may be based.

TABLE II.

Units chargeable in respect of 3-phase, 4-wire, inductive load under four systems of metering as in Table I.

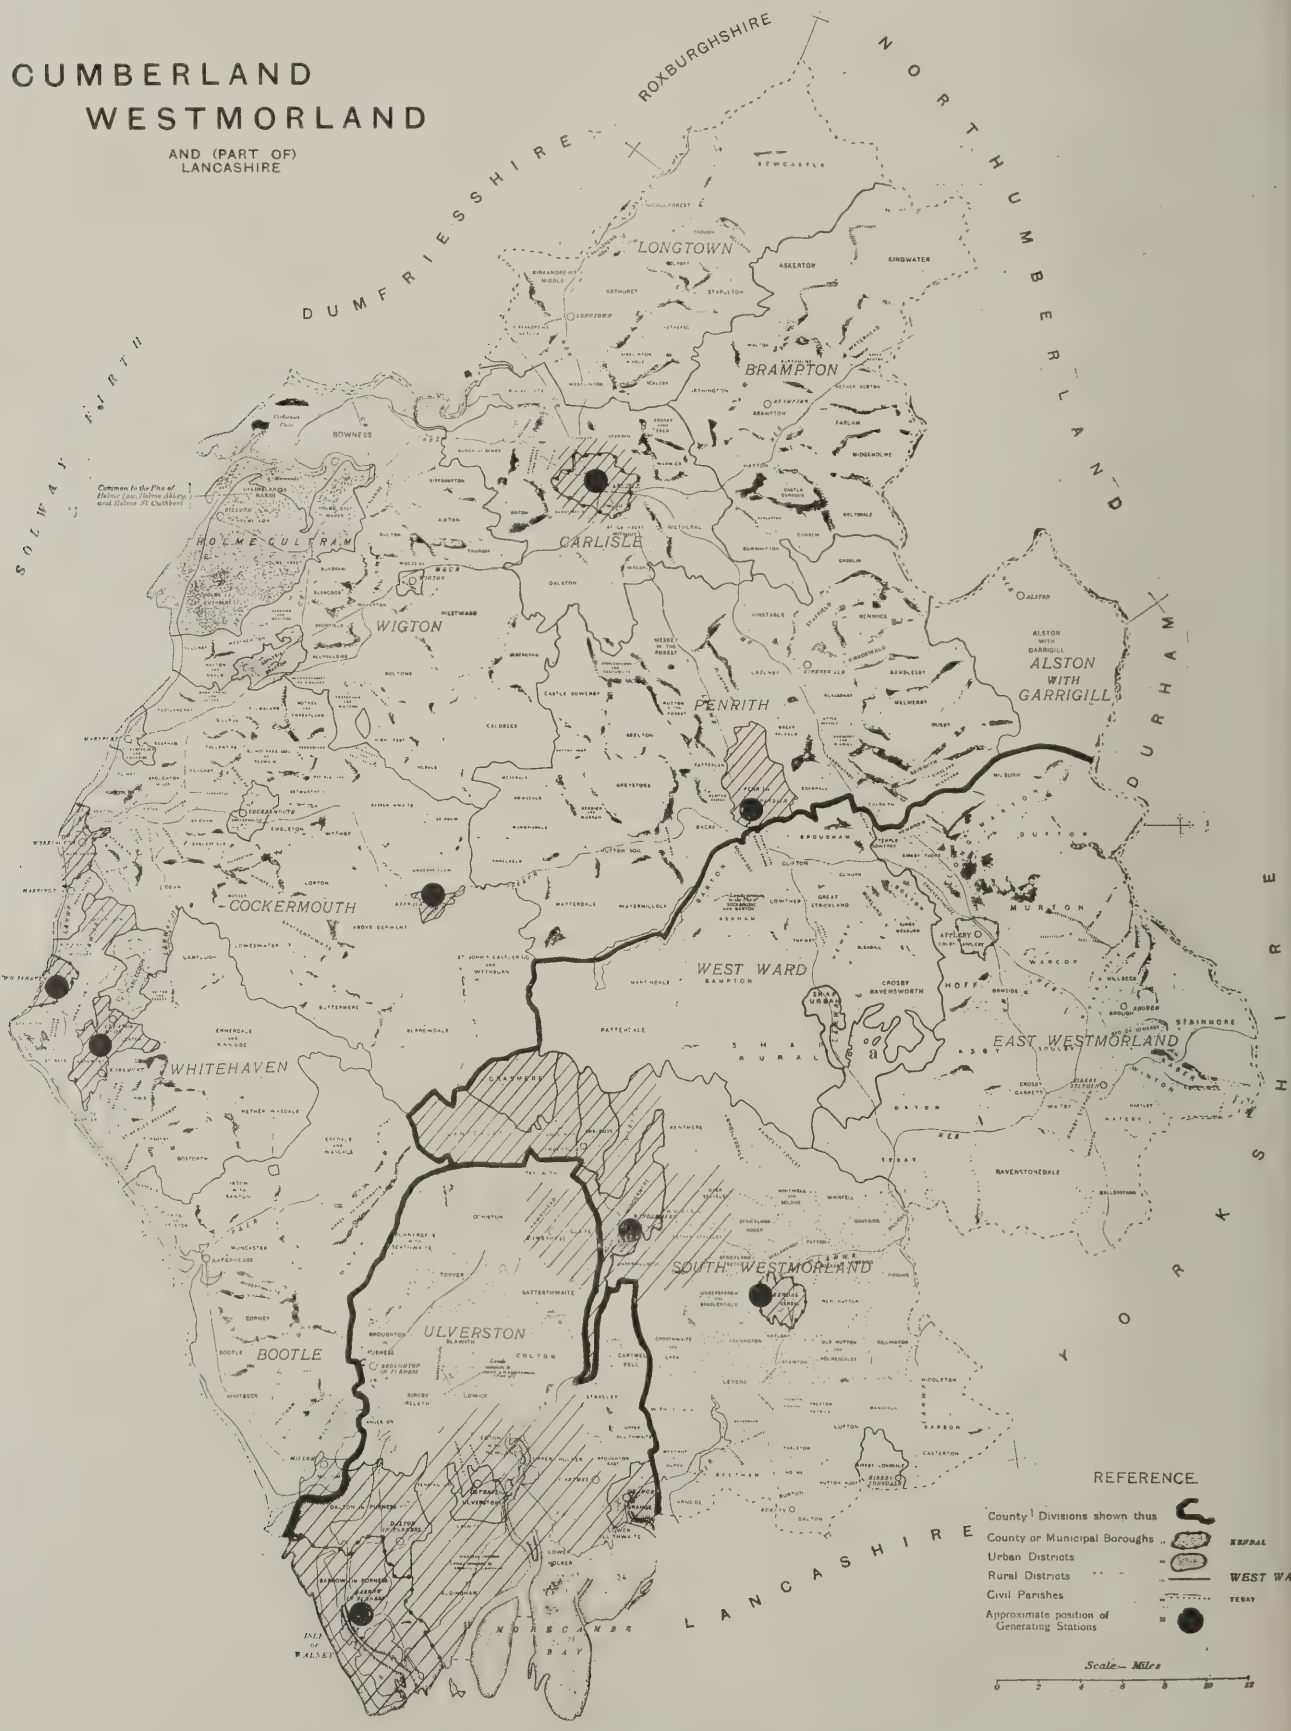
Neutral fuse, drawn ...	1	1	1	,,	99	95	98	101

It will be noted that Systems Nos. 1 and 4 integrate accurately under all the conditions produced. The 3-element, 2-rotor meter in System No. 3 tends to speed up during periods of partial disconnection from the mains, due, no doubt, to the elimination of "interference" factors which are present under normal conditions. System No. 2, employing the 2-element polyphase meter, proved most unreliable under certain circumstances. When the red phase or blue phase fuses are "blown" or withdrawn, a very definite source of error is introduced, due to there being only one of the two shunt coils energised at the time. As this coil interacts with the half of the white phase current coil overwound on that particular element, the resultant torque—and in consequence the registration—is affected correspondingly. Under non-inductive conditions, the meter registers only 50 per cent. of the consumption in the white phase circuit. When the power factor of the circuit is below unity, the average error with the blue or red phase fuses withdrawn is 50 per cent., the ratio between the two errors depending on the power factor. It will be noted that with the blue phase fuse withdrawn, the accuracy of the meter improves as the power factor decreases. The reverse effect is produced when the red phase main is disconnected. When both red and blue phase fuses are withdrawn, no registration is recorded in respect of any consumption in the white phase circuit; and although this may appear to be a remote probability, the possibility is one that should not be ignored, even if the duration of the disconnection is short. The chance of one fuse being "blown" or withdrawn is certainly greater, and the possibility of such a large error in the registration of the white phase consumption when this occurs is worthy of consideration when contemplating the adoption of this type of meter. As it is difficult—if not impossible—to ensure that the condition $e1 + e2 + e3 = 0$ is maintained at all times, it is, therefore, impossible to guarantee, or to expect, complete accuracy under all circumstances. Add to this the possibility of either $e1$ or $e3$—or both—being unavailable at the meter terminals, and faith in the reliability of the 2-element meter is seriously undermined.

It has already been shown that the use of three single-phase meters is not entirely satisfactory when dealing with an industrial three-phase power supply, owing to the unbalanced readings obtained, and to the occasional meter reversals which are the cause of so much investigation and frequent dissatisfaction. It would, therefore, appear reasonable to assume that, when both 3-phase and single-phase motors are connected to a 3-phase 4-wire circuit, the choice should lie between Systems Nos. 2, 3 and 4. The 2-element meter has been shown to possess inherent weak points, which become manifest under certain conditions, and we are, therefore, left with the 3-element polyphase meter as the only "error-proof" meter to adopt for this class of load.

For non-inductive loads, Systems Nos. 1 and 4 are equally satisfactory as far as performance is concerned. I would, however, in conclusion, quote an analogy to point a moral. One buys an adding-machine as a step towards increased efficiency, and as a time and labour-saving device. After manipulation, a final total is expected, and is recorded. It is not necessary to add up, say, three independent results to get that total; it is done automatically and accurately by the machine. What a wonderful "adding-machine" the polyphase meter is, accomplishing, as it does, even algebraical sums when occasion arises, and recording the net result on one dial.

An Enlarged Mollier Diagram.—A Mollier diagram on a large scale, plotted by Prof. H. L. Callendar, F.R.S., from his enlarged steam tables, has been published by Messrs. Edward Arnold & Co. for the British Electrical and Allied Industries Research Association. The diagram, which was prepared for the Turbine Section of the Beama, relates to saturated and superheated steam, and measures 660 × 800 mm.; it is admirably printed in three colours, and is very clearly figured, while the scale is so large that a high degree of accuracy is attainable—one millimetre representing 0.001 ϕ and 1.0 B.th.u. per lb. The ranges covered are from 0.2 to 2,000 lb. per sq. in. absolute pressure, 0 to 500 degrees F. superheat, 0.3 to 1,000 cu. ft. per lb., 100 to 1,000 degrees F., 65 to 100 per cent. dryness, and 26 to 29.6 in. vacuum. The corresponding range of entropy is from 1.36 to 2.02, and of total heat per lb. from 700 to 1,500 B.th.u.



The diagram, which is priced at 4s. net, is a very fine production, and will be very useful to engineers concerned with $H - \phi$ calculations.

Electricity Supply in Great Britain.—XIV.

Cumberland, Westmorland, Lancashire, and Cheshire.

With reference to the accompanying maps, which have been hatched to show the areas occupied and applied-for in respect of statutory powers for general supplies of electricity, it has been found convenient to include the north-west portion of Lancashire with the map of Cumberland and Westmorland. Space will not permit of the map of Cheshire being reproduced, but it is available if required. Prints on art paper of the maps which have appeared in this series, and coloured maps, 4 miles to one inch, are also available.

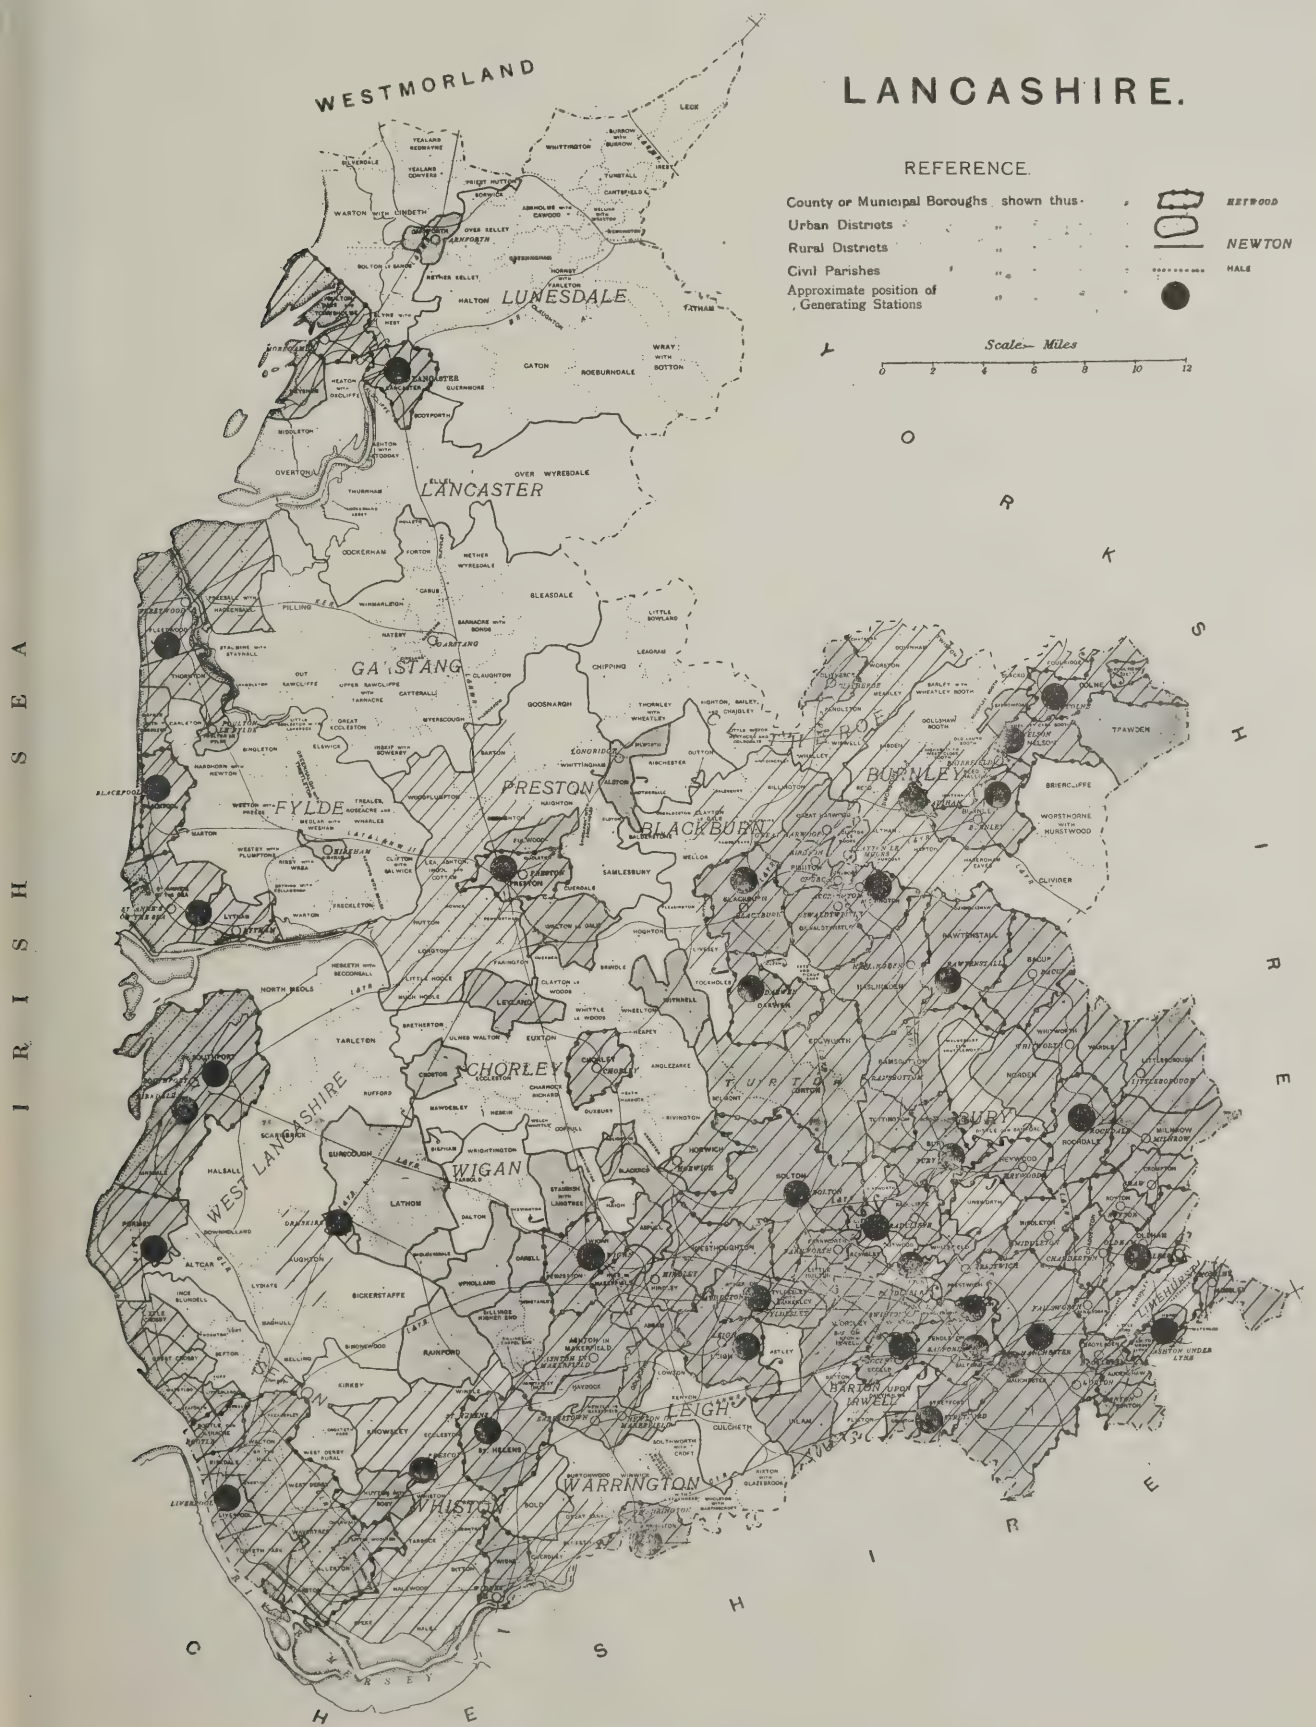
The 1921 Census gives the following figures for the Administrative Counties and County Boroughs:—

Electricity Supply in Cumberland and Westmorland.

	Acres.	Persons.	Resident families.	Buildings, not containing dwellings.
Cumberland ...	973,086	273,173	59,579	4,214
Westmorland ...	504,917	65,746	14,648	1,897
Lancashire ...	1,194,555	4,927,484	1,108,668	68,300
Cheshire ...	657,950	1,025,724	236,427	12,454
Total ...	3,330,508	6,292,127	1,419,322	86,865

The total number of kWh generated in the above counties has been ascertained by the addition of the outputs of Areas Nos. 2, 3, 5 13, and 17 (as given in Table 8 of the Electricity Commissioners' publication, "Generation of Electricity in Great Britain"), except that Chester and Crewe are excluded and Buxton and Glossop included.

Table No. 1 of this publication gives the description of these Areas as follows:—



Area No. 2.—The Mid-Lancashire Electricity District as finally determined.

Area No. 3.—The South-East Lancashire Electricity District as finally determined.

Area No. 5.—The Mersey and West Lancashire Electricity District as provisionally determined and amended.

Area No. 13.—The North Lancashire and South Cumberland Electricity District as provisionally determined.

Area No. 17.—The parts of the Counties of Cumberland and Westmorland not included in Area No. 13.

Electricity Supply in the County of Lancashire.

KILOWATT-HOURS GENERATED.

Year ending March 31.	Area No. 2.	Area No. 3.	Area No. 5.	Area No. 13.	Area No. 17.	Total of Areas Nos. 2,3,5,13 & 17
1922	66,209,448	536,292,207	231,943,138	12,503,161	9,066,355	855,954,309
1923	82,413,644	647,284,355	280,552,537	13,263,085	10,737,169	1,034,250,790

2 & 3	Lancashire Electric Power Company.
5	Mersey Power Co., Ltd.
5	Northwich Electric Supply Co., Ltd.
5	Ormskirk Electric Supply Co., Ltd.
5	Ormskirk Gas & Electricity Co.
17	Penrith Electric Supply Co., Ltd.
13	Windermere & District Electric Supply Co., Ltd.

All the above Companies possess generating stations except the Hightown Gas & Electricity Co., which takes a bulk supply from the L.M.S. Rly., and the Ormskirk Gas & Electricity Co., which has not yet commenced supply.

The area of the Lancashire Electric Power Company has not been hatched, except where statutory powers for general supplies are held or have been applied for. This Power Company has various powers over that part of Lancashire which lies south of the River Ribble, except for certain County Boroughs, and it also holds 18 distribution Orders. The Power Company's generating stations at Radcliffe and Padiham have been indicated on the map. Separate dots have been shown for Manchester Corporation's stations at Barton and Stuart Street, and also for Salford Corporation's stations at Agecroft and Frederick Road.

The generating stations of the London, Midland and Scottish Railway at Clifton and Formby, and that of the South Lancashire Tramways Company at Atherton, have also been indicated on the map.

Applications for Special Orders have been lodged by the following:—

Lancashire Electric Power Company.
Gwynedd Trust, Ltd.
Chester Corporation (Extension).
Millom Urban District Council.
Barton-upon-Irwell Rural District Council and Urmston Urban District Council jointly.

These maps are reproduced by permission of the Controller of H.M. Stationery Office.

The originals were prepared by the Ordnance Survey Department for the 1917 Boundary Commission. Since 1917 many alterations to areas, &c., have been made, of which particulars are available if required.

The Fine Regulation of Resistance.

Some Particulars of the Multi-Step Rheostat.

By R. AMBERTON, M.I.E.E.

The problem of fine regulation over a considerable range of resistance is an old one. There is not much difficulty if the current to be carried is infinitesimal, or if it is permissible to employ a rheostat with coarse steps of relatively high-resistance values, and subsequently to make the final adjustment on one or more separate finely-graded rheostats having a relatively low resistance. This method is the usual one when the final resistance value to be obtained is the only consideration, but it is of no use when it is essential that fine regulation is available throughout the range, and when the "kick" or "jump" caused by moving the coarse rheostat a step backwards or forwards defeats the object of the combination.

The regulation of the exciter fields of alternators and motor converters is a case where smooth regulation over a fairly wide range of resistance is necessary, although, of course, there are many other applications. The employment of separate coarse and fine rheostats being in many cases ruled out on account of the resultant "kick" when the arm of the coarse rheostat is moved, the usual practice is to use an ordinary single-arm rheostat with a large number of steps. This rheostat is graded as carefully as possible, so as to ensure the most satisfactory results at the most critical points. Theoretically, of course, there is no reason why this method should not prove perfectly satisfactory, but there are certain practical difficulties which limit its scope.

If space and cost were of no consequence, it would be possible to imagine a rheostat with a faceplate large enough to have, say, 400 contacts. This would be ample for practically all requirements, but it would involve the use of a faceplate over six feet square. Quite apart from the cost, which would be prohibitive, it is not often that this amount of space is available.

With a more modest rheostat, having between 100 and 200 steps, the faceplate can be kept within a reasonable space, but the difficulty which the rheostat maker has to face is that of making such a large number of satisfactory insulated connections from the contacts of the rheostat to the resistance elements. If the size of the rheostat and its resistance is to be kept within the compass demanded by cost and switchboard space, it must necessarily be run at a reasonably high temperature; and there is only a limited choice of commercial insulated wires which will retain their insulating properties over a period of years when subjected to heat and friction due to expansion and contraction when the connections are bunched up with a couple of hundred of their fellows.

The makers of exciter field rheostats and the manufacturers of dynamo-electric machinery are aware of the difficulties, and take them into account. The result is a compromise, and whilst the rheostat maker has on

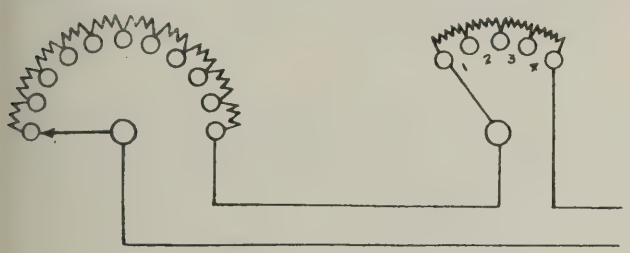

Fig. 1.—Fine and Coarse Rheostats in Series.

occasion to supply exciter field regulators with rather more steps than is quite convenient, the designer of the machine has to put up with rather fewer than he would like. From time to time attempts have been made to solve the problem, and the most popular method has been the combination of coarse and fine rheostats operated by a single hand-wheel. One of these was described on page 673 of the Electrical Review, published on May 7th, 1915.

In view of the fact that previous attempts have been made to combine two rheostats to obtain even regulation over a wide range, it is as well to point out why they have hitherto not fully achieved their object. Fig. 1 shows a coarse rheostat in series with a fine one. Assuming that the whole of the resistance of the fine rheostat is equal to one step of the coarse rheostat, it is obvious that the total number of resistance values which can be obtained with the combination, is the product of the number of steps of fine and coarse. It is equally true, but not quite so obvious, that with the electrical connections as shown it is absolutely impossible to avoid a " kick " when the coarse rheostat is moved from one step to another. This difficulty remains and must remain, whatever forms the rheostats take, or whatever the mechanical arrangements may be, so long as the electrical connection between the two rheostats is

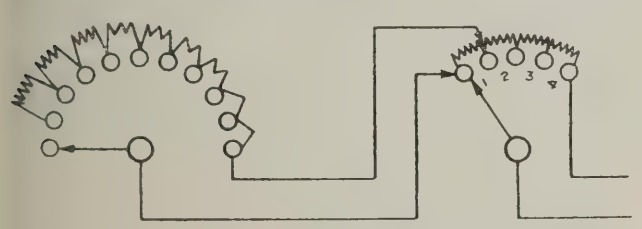

Fig. 2.—Principle of the Multi-Step Rheostat.

in effect a series connection. It is curious that this point should have been consistently overlooked, but the fact remains.

The solution is quite simple, as will be seen from fig. 2, and it is on these lines that the multi-step rheostat (Patent No. 212,089) is constructed. It is clear that without moving the arm of the coarse rheostat it is possible to cut out its first step by means of a left to right movement of the fine rheostat, and, if the resistance of the latter is suitably graded, resistance will be cut out in equal increments.

Having short-circuited the first coarse step in gradual stages by means of the fine regulator, the arm of the coarse rheostat can be moved forward one step, thus taking up the short circuit and enabling the fine rheostat to be disconnected from the coarse one without electrical change. The arm of the fine rheostat is now returned to the " off " position, and its terminals are connected to bridge the second step of the coarse rheostat ready to cut out this step in a manner similar to the first. After cutting out the second step by gradual stages the cycle of operations can be continued until all the resistance is cut out. Similarly, by reversing the procedure the whole of the coarse resistance can be put in by equal increments.

It now remains to be shown how these somewhat cumbersome operations can be translated and co-ordinated into a practical method of combining a coarse and a fine rheostat so that the whole of the resistance of the former is cut out in equal fine gradations and without " kicks " by means of a unidirectional movement of one hand-wheel. To do this it is necessary to introduce a third rheostat, or rather a third set of contacts interconnected with the coarse and fine rheostats in such a manner as to facilitate the changes of connections which are necessary after cutting out one step, and before starting to cut out the next.

In the diagram (fig. 3) the essential parts are; the main rheostat with its insulated brush A, the auxiliary rheostat with its insulated brush B, and the fine rheostat with its insulated brush C. Brushes A and B are carried on a common arm (afterwards referred to as the main arm) and move in unison. Brush C is carried on a separate arm (which will be referred to as the short arm) intermittently coupled to the main arm in such a manner

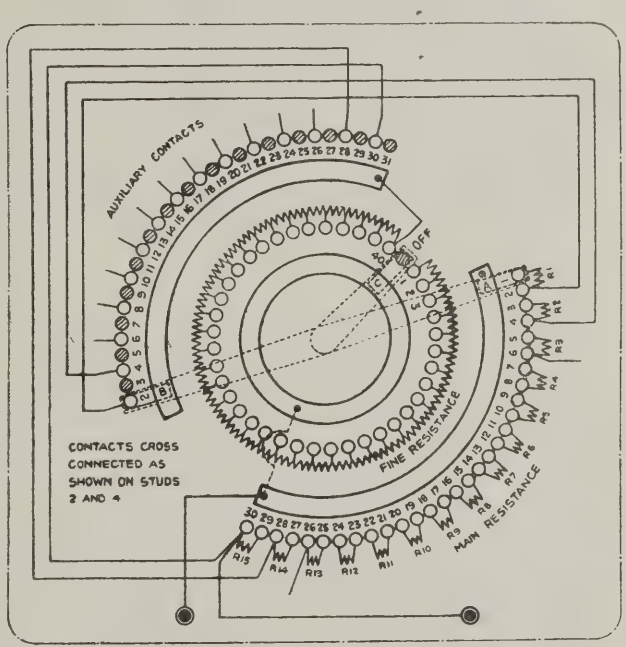

Fig. 3.—Multi-Step Rheostat: Diagram of Connections.

that for each complete revolution of the short arm the main arm moves over one section of resistance, *i.e.*, from one dotted line to the next.

Brush C is shown on its " off " position, and if the diagram is studied it will be found that if it is moved in a clockwise direction on to its first contact, the total resistance of the fine rheostat is in parallel with R1, the first step of the main resistance. Continuing the clockwise movement, the resistance is gradually cut out until when the fine rheostat reaches its " full on " position, all its resistance is cut out and the first step of the main resistance is short-circuited. At this point the gearing between the short and the main arms comes into mesh, and the following changes of connections occur :—

1.—Brush A moves forward one contact (to stud 2), thereby taking up the short circuit of the first coarse step (R1) which C established. Brush B moves forward one contact on to a shaded stud, thereby disconnecting itself, since the shaded studs are not connected to anything. Brush C moves on to its " off " position. These movements are all simultaneous.

N.B.—Various connections have been changed, but there is no change of electrical resistance.

2.—The movement being continued, brush A moves forward one contact to stud 3 which, however, being directly connected to stud 2, which it has just left, causes no electrical change. Brush B moves forward one contact to stud 4, and is now connected to the remote side of R2, the second main step of resistance. This movement by itself does not effect any change of resistance, but as soon as brush C (which is moving simultaneously) reaches its No. 1 contact, the whole of the fine resistance is in parallel with R2, the second step of the main resistance. Just before this stage is reached the mechanical gearing between the short and the main arms comes out of mesh, so that a continued clock-wise movement of C will cut out R2 in gradual stages, just as R1 was previously cut out.

By continuing the movement R3, R4, R5 and all the rest of the main steps are successively cut out by equal increments, and a reversal of the movement at any stage

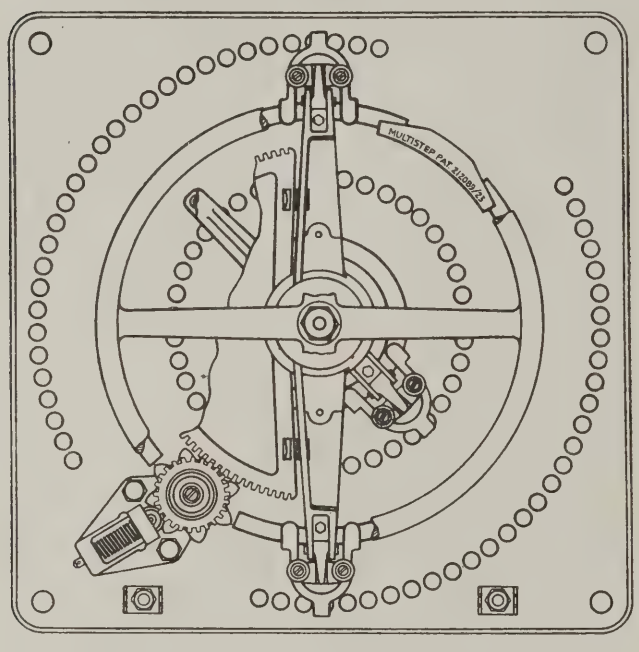

Fig. 4.—General Arrangement of Rheostat.

will cut in resistance in a similar way. Fig. 4 is a drawing of the complete rheostat. The functions of the arms have already been explained, so that it only remains to describe the mechanical arrangement. The operating hand-wheel is directly coupled to the main spindle of the rheostat. The short arm is pinned to the main spindle, and rotates with it. The main arm is loose on the spindle, and friction is reduced by ball bearings, as the main arm has to remain stationary during the bulk of the movement of the spindle. It is important that the relative positions of the two levers should always be correct during their period of engagement. To ensure this a ram has been included, bearing on the blunt-toothed driving wheel, which thus also acts as a star wheel.

The short arm carries a striking pin with roller on its tail piece. Once in every revolution it engages with the blunt-toothed star wheel and moves it round one notch. This blunt-toothed wheel carries a small pinion which engages with the semi-circular rack carried by the main arm, so that during the period of engagement between the striking pin on the short arm and the star wheel, the main arm (carrying brushes A and B) moves correspondingly.

It is obvious that by increasing or decreasing the size of the rheostat a larger or smaller number of steps can be provided. The illustration shows a standard multi-step rheostat with 15 sections of coarse resistance, and 40 sections of fine, thus giving 600 effective steps without "kicks" and by means of a unidirectional movement. As a maximum, 55 connections are required from the two sets of studs to their respective resistances. In practice, a smaller number of insulated connections is required as a rule, as at one end of the fine rheostat, the resistance values are generally so low as to enable the requisite resistance to be obtained by means of short lengths of rigid self-supporting resistance wire directly connected to the studs.

To move the main arm from the "all in" to the "all out" position fifteen revolutions of the hand-wheel are requirevd. If it were ever necessary to move the main rheostat arm rapidly from one end to the other this could be quite easily provided for by the addition of means for directly engaging the small pinion, but for ordinary purposes it would be an unnecessary complication. As constructed, the hand-wheel of the multi-step rheostat can be moved from end to end in less than ten seconds. In practice this extreme movement would hardly ever be required, as the normal position of the rheostat in operation would be somewhere about midway, and variation would start from there.

Whilst 600 equal steps will be found satisfactory and sufficiently fine for most purposes, there is nothing to prevent graduation of the main resistance of the multi-step rheostat. With such an arrangement the fine regulator of the combination would be stepped to give equal

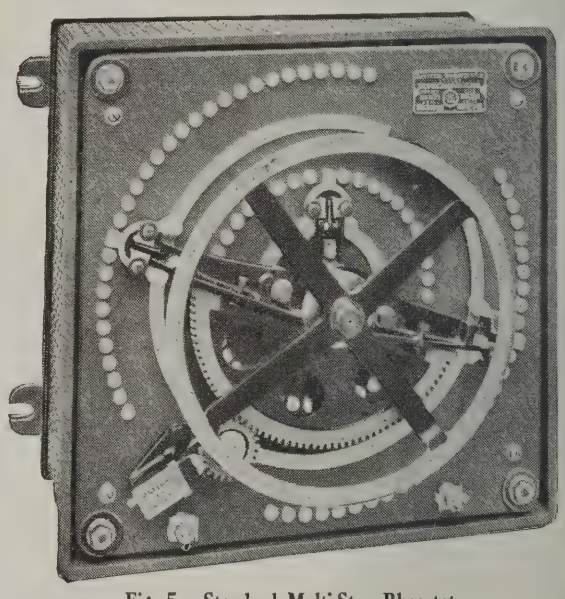

Fig. 5.—Standard Multi-Step Rheostat.

gradations over the important portion of the range, giving increments of, say, 1/1,200th to 1/1,800th of the total resistance per step. The effect of this at the unimportant parts of the curve may result in unevenness equivalent to, say, 1/300th to 1/200th of the total resistance—in other words smoother regulation at the unimportant parts of the curve than was formerly obtainable at critical points, and infinitely better regulation at the point where it is wanted.

Fig. 5 shows externally the complete multi-step rheostat.

The Audiophone.—A telephone receiver that fits into the lower cavity of the ear has been developed for the use of those who are hard of hearing. The new receiver is exceedingly small, weighing only six-tenths of an ounce with the connecting cord, which is but little more conspicuous than an eye-glass ribbon. This comfortable device is used in combination with a transmitter and batteries, and has been made possible through use of the magnetic alloy "permalloy," says the *T. and T. Age*. The outfit, of which the receiver is part, is known as an audiophone. It was developed for the Western Electric Co in the Bell Telephone Laboratories as a by-product of fundamental research into the field of sound. It comprises a microphone "as large as a stack of half a dozen fifty-cent pieces," an amplifier containing two tiny vacuum tubes, the necessary batteries and the "ear" receiver. The outfit will normally comprise a microphone, worn in the coat lapel, an amplifier in a box, which may be carried in the hand or placed on a table or desk, and the receiver, which is worn in the ear. Using it, a person who has lost sixty per cent. of his hearing can again follow the conversation in any ordinary sized room. Without the audiophone's aid, such a person, or one of only fifty per cent. loss, could not understand anything of an ordinary conversation. The cartilages of the outer ear are rigid enough so that when an impression is taken and a moulded fitting made and inserted, they will support the little receiver with complete comfort to the wearer. The use of permalloy, the nickel-iron alloy, in the magnetic circuit of the tiny receiver makes it more sensitive; it also prevents acoustic shock

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Engineering Merger Confirmed.—The scheme for the malgamation of the Mirrlees, Watson Co., Ltd., and Mirrs, Bickerton & Day, Ltd. (outlined in our issue of March th, p. 456), was confirmed at an extraordinary meeting on pril 2nd. The increasing of the company's capital to 90,000 was approved and additional directors were apointed.

New Municipal Showrooms and Offices.—Last week the ord Mayor of Belfast informally opened the new offices and owrooms recently constructed in connection with the Elecicity Department of the city. We have received a set of hotographs from Mr. Johnstone Wright, the city electrical ngineer, which show the new premises to be very commoous and well laid out; they include an installation departent and test house. Buildings at the old East Bridge Street ation have been adapted for the purpose, an existing glass oof being retained to provide ample lighting both by day and

A Report Upon Uruguay.—Mr. H. W. Reid Brown, British Vice-Consul, Montevideo, has forwarded to the Department of Overseas Trade a report upon the financial and economic conditions in Uruguay (Stationery Office, 9d. net). This shows that Great Britain held the second position in Uruguayan import trade with a share of $11,393,046 out of a total of $62,228,753 for 1924.

Wages in the Engineering Industry.—Speaking at the annual dinner of the Machine Tool Trades' Association on March 30th, Mr. J. T. Brownlie, president of the Amalgamated Engineering Union, said that, although at present adverse conditions prevailed in the engineering industry, he was not without hope that it would soon come back into its own, and that skilled workmen would receive the wages to which they were entitled. Referring to threats of a national lock-out, he said that the country would not permit such action. He hoped that when the unions and the Engineering

Fig. 2. Inquiry Hall.

Fig. 3.—The Kitchen.

Fig. 4.—A Corner of the General Showroom.

Belfast's New Offices and Showrooms.

ight (in the latter case exterior roof lighting is employed). he showrooms consist of a Jacobean entrance hall, an oakanelled inquiry office, a general showroom for small domestic ppliances, fires, fittings, &c., a waiting room furnished as a itting room with a "Magicoal" antique hearth fire, an lectric kitchen, and a bathroom. Provision has also been ade for a demonstration hall. The offices and showrooms are ll electrically heated. Fig. 1 is a view of the exterior of the remises; fig. 2, the inquiry hall; fig. 3, the kitchen, in which lternative patterns of cookers, washers, &c., are shown; and g. 4 depicts a corner of the general showroom devoted mainly o fires of various types.

The Accrington Corporation Electricity Department is to rect new electricity showrooms at the junction of the Whalley nd Burnley roads, at a cost of £3,000.

On April 8th, the Birkenhead Corporation will open ts new electricity showrooms in Grange Road West. The round floor is set aside for general lighting fittings, fires, table tandards, &c., and the first floor for kitchen accessories, carpet leaners, washers, &c.

and Allied Employers' Federation came together in conference in a few weeks' time wiser counsels would prevail, and that the Federation would adopt the suggestion which he had made 18 months ago that the employers should mortgage the future by granting increased wages. That would be the soundest investment that they had ever embarked upon.

The German Radio Industry.—At a meeting of the Verband der Funkindustrie, held in Berlin at the end of last month, it was stated that, despite the extraordinary increase in the number of users of radio apparatus, many factories engaged in the production of such apparatus had been closed. Since the beginning of broadcasting in Germany 59 per cent. of the firms who had engaged in the manufacture of wireless apparatus had been compelled to discontinue production, leaving it in the hands of a limited number of efficient firms who turn out superior apparatus.

Lantern Slides.—Messrs. Petters, Ltd., of Yeovil, have prepared a series of lantern slides, illustrating their oil engines, which they will be pleased to lend to authors of lectures and papers on internal-combustion engines.

The Sydney Electricity Department.—According to the Sydney *Daily Telegraph*, the Labour aldermen of the City Council are determined to give preference to Australian tenders for the generating plant required by the Council, in spite of any recommendations to the contrary. Reporting upon the Council's proposal to sell electrical appliances and fittings, the acting general manager of the Electricity Department (Mr. S. Y. Maling) says:—"It is almost certain that great opposition will be met if efforts are made by the Council to purchase apparatus in bulk locally, but local buying should be given a trial. If this fails, then apparatus should be bought in bulk abroad; and while the general manager (Mr. Forbes Mackay) is abroad is an opportune time to launch this scheme, as he could make arrangements for purchase and shipment." At a meeting of the Electricity Committee it was alleged that electrical appliances were being imported and sold at extortionate prices. Despite a good deal of adverse criticism, the Committee decided to recommend the Council to adopt a trading scheme.

Calendar.—As Easter comes round, the Metropolitan-Vickers Electrical Co., Ltd., issues from Trafford Park a "Girl" calendar for the coming year. This time the Company's Publicity Department has again made a pleasing selection—Miss Violet Hemming, who is at present playing in "Rose Marie" in America, and whose portrait—accidents omitted—will adorn our walls until the end of March, 1927.

Metro-Vick House.—During the present month the London district office and London erection staffs of the Metropolitan-Vickers Electrical Co., Ltd., will be transferred to the company's new premises, Metro-Vick House, Charing Cross Road, which will also become the home of Metro-Vick Supplies, Ltd. The administrative and executive departments of the Metropolitan-Vickers Electrical Co., Ltd., with the Traction Bureau and the Metropolitan-Vickers Electrical Export Co.'s staffs will continue at 4, Central Buildings, Westminster, which remain the registered offices of the company.

The New London Premises of the Metro-Vick Supplies, Ltd.

Sydney Alderman and a Directorship.—The Sydney *Daily Telegraph* reports that a prospectus was recently issued by a company formed to manufacture electrical fittings, and among the directors was Alderman J. H. Mostyn, described as "Chairman, Electricity Committee, City Council, Sydney." In another part it was stated: "This means that for new work alone 156,000 small fittings are required for the Sydney City Council service." In an interview, Alderman Mostyn denied that the company was floated to supply special fittings to the Council as some people thought; it was formed to give an opening to an Australian invention which could be manufactured and sold in Australia.

The Swedish Electrical Industry.—The *Swedish Econo Review*, the official journal of the Swedish Board of Tra states that the machinery industry showed a decided impro ment during 1925. The exports of electrical machinery rose value from 17.7 million kronor (£983,333) in 1924, to 21 mill kronor (£1,166,666) in 1925. At the same time the value exported telegraph and telephone apparatus fell from 7.5 r lion kr. (£416,666) to 7 million kr. (£388,888). The exports this apparatus for January were very low, reaching a va of only 198,000 kr. (£11,000).

The E.D.A. Staff at Olympia.—The staff of demonstrat at the "Electric House" arranged at the recent Ideal Ho Exhibition, Olympia, by the British Electrical Developm Association, had a very busy time and did much to furt

The E.D.A. Staff at Olympia.

the "electrical idea." We reproduce a photograph of th ladies and gentlemen; the ladies appear to be grea attached to their charges.

East Kent Contractors' Dinner.—The East Kent Bra of the Electrical Contractors' Association held its ann dinner on March 24th. Mr. D. McKellar (chairman) presid and he was supported by Mr. T. E. Alger (president of E.C.A.), Mr. L. C. Penwill, and Mr. P. A. Bennet, secret of the branch. Mr. G. M. Willis, of Ramsgate, in welcom the Mayor of Margate (Councillor T. D. Wood), touched u the subject of municipal electrical trading. He said that w contractors had no objection to municipal authorities supply electricity or gas, they considered that the wiring of buildi and the supply of fittings should be left to them. The May in reply, said that he knew little of the subject. He exten an invitation to the E.C.A. to hold its 1927 meeting at M gate. The Chairman proposed the toast of the Associati and mentioned that the branch had increased in size by 30 cent. during the past year. Mr. T. E. Alger, who respond spoke against municipal trading, and said that every r department set up by a local authority created another se officials. Contractors should not imagine that the Gov ment's Electricity Bill was going to increase their busi immediately. It might have that effect in eight or ten ye time. Reverting to municipal trading, he said that to s time and expense, a Committee of both Houses of Parliam should be set up to settle the matter once and for all. considered that the Committee on the Colwyn Bay Bill prejudiced from the start; the Association had been n successful regarding the Doncaster Bill. Mr. Alger appe to contractors to become registered, and he also expressed regret at the recent death of Mr. L. G. Tate. Other to submitted were "The Electrical Supply Authorities," propo by Mr. J. Martin and replied to by Mr. C. F. Hume (Ra gate and District Electric Supply Co., Ltd.); and "The Ma facturers and Wholesale Traders," proposed by Mr. C. Roberts and responded to by Messrs. H. F. Roberts (G.E and T. Hudson (Henley's).

South Shields Tramways Dispute.—The *Newca Chronicle* reports that the Electrical Power Engineers' A ciation has warned the South Shields Tramways Commi that it will deprive the system of power by the withdra of some of its members unless the notice of dismissal gi to Mr. F. R. Batey, the assistant engineer, is reconside Mr. Batey is one of three officials whose services are be dispensed with by the Committee on the score of red dancy. The Mayor, when interviewed, stated that the missals were part of a reorganisation scheme by which, it hoped, the department would become a paying concern. notice tendered by the E.P.E.A. was to take effect yester (Thursday), and the matter was to be considered by the Tc Council the previous day.

Recent Contracts.—The Mirrlees Watson Co., Ltd., recently supplied to the Ilkeston and Heanor Water Board electrically-driven bore-hole pump capable of delivering 35, gallons of water per hour.

The Automatic Telephone Mfg. Co., Ltd., has recer completed an automatic exchange (2,000 lines) at Ipswich.

Electromobile, Ltd., has secured large orders for elec trucks in connection with Spanish railway developments, an order for Australia for an electric locomotive. Recent Hc orders include standard electric trucks for Home concer

ectric tractors and crane trucks for the L.M.S. Railway; nall electric locomotives for the Admiralty and War Office; id tower wagons for municipal tramway undertakings.

Among the orders recently received by International Comıstion, Ltd., are one for complete steam-generating, Lopulco" combustion equipment, &c.; and "Lopulco" uipment for the large station in Buenos Aires for the Cia. ispano-Americana. The company has also been appointed ain contractor for the new "super" station at Congella, urban.

Trade Announcements.—Mr. A. Wright (Inventum Electical Appliances, &c.) has removed to 124, Chancery Lane, .C.2.

Messrs. Thompson & Co. have centralised their business their warehouse address:—1 & 3, Old Swan Lane, Upper ames Street, London, E.C.4.

Catalogues and Lists.—Messrs. David Brown & Sons Huddersfield), Ltd., Park Works, Lockwood, Huddersfield. An illustrated brochure dealing with the design and manucture of worm gearing.

British Central Electric Co., Ltd., 6 and 8, Rosebery venue, E.C.1.—An illustrated catalogue of switchgear, bles and wires, wall plugs, adaptors, &c.

Metro-Vick Supplies, Ltd., 4, Central Buildings, Westminer, S.W.1.—An illustrated and priced folder advertising Cosmos" gasfilled, vacuum, and colour-sprayed lamps.

The Damard Lacquer Co., Ltd., Warwick Road, Greet, Birmingham.—A brochure dealing with the moulding of Formite" bakelite materials.

Siemens & English Electric Lamp Co., Ltd., 38-39, Upper ames Street, E.C.4.—List No. 99, containing illustrations d prices of "Silvaray" one-piece glassware lighting fittings.

Messrs. John Armstrong & Co. (Manchester), Ltd., Barn Square, St. Ann's Street, Manchester.—A blotter adversing the company's electrical contracting business.

Messrs. Ferguson, Pailin, Ltd., Higher Openshaw, Manester.—Catalogue Sections Nos. 25/S1, 166/S1, and 166/S2, aling with oil-immersed metal-clad switchgear.

The General Electric Co., Ltd., Magnet House, Kingsway, .C.2.—Publication O.V. 4,082, describing the company's 2-V, 12-A radio valves introduced a short time ago. Also the Osram Bulletin" for March, containing notes and news of Osram" illumination schemes, valves, and appliances, and illustrated leaflet announcing reduced prices for "Magt" electric fires (stocktaking bargains).

Mr. Albert Morgan, 138, Gower Street, W.C.1.—Illusated pamphlets giving details of wall cranes, pulley blocks, c.

Trelleborg Ebonite Works, Ltd., Audrey House, Ely lace, E.C.1.—Pamphlets advertising the firm's ebonite.

Midland Flexible Metallic Tubing Co., Ltd., Bridge Street, ong Eaton, Nottingham.—Twenty-four page illustrated catague relating to the company's flexible metallic tubing and nnections. Views are given of various departments of the orks, also particulars of flexible arms or standards for electric ghting, and electric wire and cable armouring.

Dixonia, Ltd., 4, Portsmouth Street, Kingsway, W.C.2.—An ustrated and priced catalogue of automobile accessories—ainly lighting fittings.

Shell-Mex, Ltd., Shell Corner, Kingsway, W.C.2.—A rochure dealing with "Shell" lubricating oils.

Messrs. L. McMichael, Ltd., Wexham Road, Slough, ucks.—A priced and illustrated pamphlet advertising the M H" loud speaker filter.

The Jackson Electric Stove Co., Ltd., 143, Sloane Street, .W.1.—April blotter, advertising the company's new boiling ate.

The Westinghouse Electric & Manufacturing Co., East ittsburgh, Pa., U.S.A.—A number of illustrated pamphlets aling with synchronous motors, motors for chemical works, c.

The Marconiphone Co., Ltd., 210-212, Tottenham Court oad, W.1.—Publication No. 428A, containing particulars and rices of "Marconiphone" amplifiers.

Messrs. Cooper & Co., Abbey House, Victoria Street, ondon, S.W.1.—Leaflet describing the "Homelite" illuinated nameplate device for connecting to the hall-light witch.

Metropolitan-Vickers Electrical Co., Ltd., Trafford Park, Manchester.—Descriptive leaflet 261 devoted to high-speed air-break circuit breakers up to 1,500 V d.c.; Circular 1,292 escribing "Type K" metal-clad compound-filled switchgear p to 35,000 V. Illustrated.

Bankruptcy Proceedings.—W. S. Miles, Worston Road, Burnham-on-Sea, Somerset, radio engineer.—The first meeting f creditors was held on March 31st at the Official Receiver's ffices, Bristol. The statement of affairs showed gross liabilies of £769 of which £761 was expected to rank, against net ssets of £43, leaving a deficiency of £718. Debtor attributed is failure to taking over a liability to his late partner of £600 nd other causes. The case being a summary one, was left vith the Official Receiver as trustee. The following are reditors:—

	£		£
Curtis, Thomas	600	Reynolds, W. M., Ltd.	24

A. Richardson, electrical engineer, 36, School Road, Sale, Cheshire.—First meeting, April 9th, at the Official Receiver's ffices, Byrom Street, Manchester; public examination, May 4th, at the Court House, Manchester.

C. G. Hofman (L. J. Chambers & Co.), wireless components manufacturer and electrical engineer, Andrew Works, Courthope Road, Wandsworth Road, S.W., and 7a, Victoria House, South Lambeth Road, S.W.—Bankrupt's discharge suspended until March 5th, 1928.

D. C. Fielding, wireless dealer, 48a, Cloth Market, Newcastle-on-Tyne.—Trustee, Mr. J. C. Blakey, 28, Pilgrim Street, Newcastle-on-Tyne, released March 12th.

Company Liquidations.—Johnson, Savage & Co., Ltd., wholesale electrical and radio suppliers, 66, Margaret Street, W.—A meeting of creditors was held on March 31st at the offices of the London Auction Mart, when the chair was taken by Mr. P. Barber, who had been appointed to act as liquidator in the voluntary liquidation of the company. A statement of affairs was presented, which disclosed liabilities of £1,647, all due to unsecured creditors. In addition, there were debentures and interest amounting to £632. The net assets were £61, leaving a deficiency of £1,586. The liquidator said that the debentures were issued in 1924 for cash advanced to the company by Mr. Archard and his son. The liquidator further stated that he had been appointed receiver for the debenture holders on March 16th last. The company was formed in June, 1922, with a nominal capital of £1,000. The subscribed capital was £615, of which £395 represented cash and £218 the consideration for the business taken by the company. The accounts for the year to June, 1923, showed a turnover of £5,502 and a net profit of £52. For the following year the turnover was £5,640, and there was a net loss of £838, and for the year to June, 1925, the turnover was £5,229, and there was a further loss of £209. The meeting broke up without any resolutions being passed; therefore the voluntary liquidation of the company will be continued with Mr. Barber as liquidator. The following are creditors:—

	£		£
Foster Engineering Co.	59	London Commercial Electric Stores	49
Hirst Bros. & Co., Ltd.	23	Grotte & Sohne	45
Engineering Supplies, Ltd. ...	36	Power Equipment Co.	27
Hornby, Robert, & Co.	26	Stewart, J. H., & Co.	81
Wilkins & Wright, Ltd.	20	Leigh Bros.	26
Prek, J.	35	Kersans Mfg. Co.	24
Bedford Electric Radio Co., Ltd.	41		
Lighting, Heating & Glass, Ltd.	111		

Domestic and General Electrical Co., Ltd., Hampden House, Kingsway, W.C.—A meeting of creditors was held on April 7th at the offices of Messrs. Corfield & Cripwell, E.C. Mr. W. A. J. Osborne, the liquidator, submitted a statement of affairs which disclosed liabilities of £619 and net assets of £190, leaving a deficiency of £429. Mr. Osborne stated that the company was registered on December 6th, 1924, with a nominal capital of £1,000, divided into 100 preference and 100 ordinary shares of £5 each. There had been issued 30 preference and 100 ordinary shares, or a total of £650. All the preference shares were allotted for cash. The ordinary shares were issued to the vendor, Mr. H. A. Purdie, in satisfaction of the purchase price of the business which was sold to the company. Mr. Osborne said that, so far as he could see, the company had carried on business at a loss from its inception. The deficiency, as regarded the shareholders, was £1,079, and that amount was accounted for by goodwill written off, depreciation of assets, and losses on trading. A resolution was passed confirming the appointment of Mr. Osborne as the liquidator of the company. The following are creditors:—

	£		£
Capel & Co.	54	Sun Electrical Co., Ltd. ...	27
General Electric Co., Ltd. ...	112	Hornby, Robert, & Co., Ltd. ...	52
Macintosh Cable Co., Ltd. ...	26	Smitherman, W. H.	33
Power Laundry	47	Purdie, F. S.	28
St. Helens Cable & Rubber Co., Ltd.	67	Purdie, H. A.	95

Bucks Electric Wire & Engineering Co., Ltd.—Winding up voluntarily. Liquidator, Mr. W. A. J. Osborne, Balfour House, Finsbury Pavement, E.C. Meeting of creditors, April 15th, at Balfour House, E.C. Particulars of claims to the liquidator by May 10th.

Ingleby & Co., Ltd.—A meeting of members is called for May 13th at 6, South Parade, Leeds, to hear an account of the winding up from the liquidator, Mr. R. E. Starkie.

Private Arrangements.—W. A. Simester, Brighton, wireless factor, &c.—A meeting of creditors was held recently at the offices of Messrs. Orbell & Kirk, Brighton. The statement of affairs showed liabilities of £813 and net assets of £374, leaving a deficiency of £439. It was stated that the debtor's wife was a cash creditor, and her claim could not rank in competition with those of the other creditors. The debtor commenced business in 1919. He had little or no capital of his own, and borrowed £123 from his wife, which was still outstanding. The debtor had carried on business as a factor, his turnover averaging about £2,500 per annum. The deficiency was accounted for by loss on trading and bad debts. The latter had amounted to more than £200. A resolution was passed in favour of the matter being dealt with under a deed of assignment, with Mr. A. E. Orbell as trustee, with a committee of the three principal creditors. The following are creditors:—

	£		£
London Engineering Works, Ltd.	55	Stentophone Motor Accessories, Ltd.	144
Edmonds, H., & Co.	120	Webb, W. F. & M.	22
Maglen, A. P., Ltd.	43	Woolf, M. & A.	34
Ward & Goldstone, Ltd. ...	123		

Dissolution of Partnership.—F. H. Barrell & Co., electrical and general engineers, 2a and 2b, Church Street, Staines.—Messrs. F. J. Slough, A. V. Keale and F. H. Barrell have dissolved partnership. Mr. Barrell will attend to debts.

Unemployment.—The total number of registered unemployed on March 22nd was 1,039,400, as compared with 1,070,833 on March 15th and with 1,201,315 on March 23rd, 1925.

Book Notices.—"Reid's Handy Colliery Guide for Northumberland, Durham, Yorkshire, Cumberland, and Westmorland," 1926 edition. Pp. 242. Newcastle-upon-Tyne: Andrew Reid & Co., Ltd. Price 3s. 6d.—This new issue has been revised and brought up to date from the latest official returns and other sources of information. A list of colliery owners in the respective counties, together with particulars of the collieries and their management is included. The Coal Mines Act, 1911, is reprinted in this work, which also includes the various statutory rules and Orders issued since the Act came into force.

"The Great Public Services of Italy," by Constanzo Ciano (Italian Minister of Ways and Communications). (15 pp., illus.). London: Italian State Railways Touring Office.—This booklet has been prepared to show the improvements which have been made in the past year or two in means of travelling and communication in Italy. It shows, *inter alia*, that the electrified mileage of railways increased from 288 km. in 1913-14 to 457 km. in 1920-21, and 855 km. in 1924-25.

"The Municipal Year Book, 1926." (Pp. lxxxiii+896). London: Municipal Journal, Ltd. Price 15s. net.—This handy reference work has been brought up to date and, as usual, includes a section giving the latest available financial results of the working of municipal electricity undertakings. It is worthy of note that only 12 undertakings out of over 300 failed to make a profit.

"Elementary Electrical Engineering, Theoretical and Experimental," by O. R. Randall. Pp. vi+233; figs. 177. London: Sir Isaac Pitman & Sons, Ltd. Price 5s. net.

"Loud Speakers: Their Construction, Performance, and Maintenance," by C. M. R. Balbi, A.M.I.E.E., A.C.G.I. Pp. xv.+96; figs. 57. London: Sir I. Pitman & Sons, Ltd. Price 3s. 6d. net.

"The *Journal* of the South African Institution of Engineers." Vol. XXIV, No. 8. March, 1926. Price 2s.

New French Company.—La Compagnie Electrique du Midi is the name of a new undertaking which has lately been organised in Toulouse with a capital of 2 million fr. to establish electricity distribution systems in the Rouergue, Query, and neighbouring districts.

New Businesses.—The following new electrical businesses have recently been started:—

"Mellowtone" (wireless manufacturers), Triumph House, 189-191, Regent Street, W.1.

Sleaford Electric Supply and Battery Service (general electrical and other repairs), 89a, Southgate, Sleaford.

Gibson, Wyatt & Co. (electrical engineers and suppliers), 40, Finsbury Square, E.C.2.

William Watson & Co. (electrical engineers and contractors), 16, New Durham Road, Sunderland.

Reliance Radio Manufacturing Co. (manufacture of wireless components), Little Gransden, Sandy, Beds.

Stubbs Wireless Depôt, 471, Green Street, Upton Park, E.

Uneeda Magneto Co. (general electrical repairers), 5, Cross Fountain Street, Leeds.

Reliable Battery Service (accumulator charging), 597, Green Lanes, N.8.

Electric Automatic Sign Co. (manufacturers and distributors of electric signs), 54, Gracechurch Street, E.C.3.

Old Swan Accumulator Co. (accumulator charging), 26, Stoneville Road, Old Swan, Liverpool.

Stanley & Co. (wireless and electrical engineers), 122b, Chase Side, Enfield, Middlesex.

Service Supply Co. (electric lamps and wireless valves), 1, Bangor Street, Cardiff.

Electric and Model Engineering Co. (manufacturers of electrical fittings, radio and general engineers), Station Approach, New Malden, Surrey.

York Radio Supplies (factoring radio goods), Coffee Yard, Stonegate, Yorks.

Rendel Supplies (dealers in radio and electrical equipment, &c.), 5, Hope Street, Brierfield, Lancs.

Universal Bracket Co. (aerial equipment supply), Alpine Steelworks, East Molesey, Surrey.

P.W Radio Service, wireless retailer, at 47, Barking Road, Canning Town, E.16.

Jackson's Nofolt Wireless, wireless dealer, at 6, Warwick Street, W.1.

T. Hamnett, electrician, at Curon Street, Plymouth Grove, Chorlton-on-Medlock.

The Radio Stores, wireless accessories and repairs, at Southey Street (over J. Peel's), Keswick.

Westminster Electrical Co., electrical and wireless wholesalers, at 2, Tanswell Street, Lambeth, S.E.1.

Delcoe Accumulator Service Station, general maintenance and sale of accumulators, electrical engineering, at 165a, Percy Road, Shepherd's Bush, London.

For Sale.—Messrs. H. Butcher & Co. will sell by auction on April 15th and 16th, at the Strode Engineering Works, Herne, Kent, miscellaneous electrical stores, lighting sets, batteries, cables, &c.

Local Exhibition.—Evesham.—The Shropshire, Worcestershire, and Staffordshire Electric Power Co. recently organised an electrical exhibition at Evesham, and a number of leading firms participated. Domestic appliances and lighting fittings were shown by the General Electric Co., Ltd., the British Thomson-Houston Co., Ltd., and the Cable Accessories Co. Ltd. The B.T.-H. Co. also installed radio reproducing apparatus. Messrs. W. & T. Avery showed scales and the Singer Sewing Machine Co., Ltd., exhibited examples of electrically-driven machines. The Power Co. itself arranged a suite of rooms—dining-room, kitchen, scullery, bathroom and bedroom—and equipped each room with appropriate electrical appliances. In addition, the company set up a model shop-window with special lighting arrangement. Films dealing with electrical subjects were exhibited during the show, and lectures were given by Miss Margaret Partridge, B.Sc. (E.A.W.), Mr. V. Dale (E.D.A.), and Mr. G. F. Francis (B.E.A.M.A.).

Manchester.—A Better Housing and Housekeeping Exhibition is to be held from to-day (Friday) to May 1st. Among the exhibitors is the Central Cables & Accessories, Ltd., which is showing the "Central" vacuum cleaner with a rotating brush and the "Centralette" pattern with a fixed brush.

A Report on East Africa.—Mr. C. Kemp, Deputy Trade Commissioner, has forwarded to the Department of Overseas Trade a report upon the trade and commerce of the Uganda Protectorate, Kenya Colony and Protectorate, Zanzibar and the Tanganyika Territory (Stationery Office, 1s. 6d. net). In the course of this it is stated that, while the United Kingdom still secures practically the whole of the trade offering in electrical goods and apparatus, a certain amount of competition from Germany is in evidence, and will probably increase at a later date. The large increases in the imports of machinery are said to be direct evidence of the recovery of the market. An appendix to the report contains the following information relating to the imports of electrical goods and apparatus for the first six months of 1924 and 1925, the figures in parentheses indicating the percentage supplied by the United Kingdom:—Kenya and Uganda: 1924, £19,9[illegible] (91); 1925, £13,555 (97); Tanganyika: 1924, £6,229 (8[illegible]); 1925, £4,210 (85). Zanzibar: 1924, £27,423 (95); 1925, £4,[illegible] (76). The figures for the whole of 1924 were:—Kenya and Uganda, £28,945 (96); Tanganyika, £9,626 (80); and Zanzibar, £17,636 (84).

The Osaka Electrical Exhibition.—In the scientific domain nothing has made such wonderful progress in Japan as the application of electricity to all branches of activity. It was in 1918 that the first Japanese electrical exhibition was held in Tokio. This exhibition was a colossal success, and proved a considerable stimulus to the development of Japan's electrical industry, which has since made great strides. A second exhibition in two parts is being held in Osaka, one near the Osaka Harbour and another at Tennoji Park, both simultaneously under the auspices of the Electrical Association of Japan. The exhibits comprise electrical plant and machinery, electric furnaces, motors, ship's electrical appliances, testing instruments, radio sets, household electrical appliances, medical instruments, agricultural implements and in fact, all kinds of equipment, appliances, inventions and devices in any way connected with the use of electricity. Demonstrations of the various exhibits are being made under actual working conditions. The exhibition will remain open until May 31st. The keen interest with which the exhibition is regarded by the public may be gauged by the fact that more structures than originally planned had to be built in order to meet the demand for exhibition space.—*Reuter's Trade Service* (Osaka).

Social Events.—The staff of the Woolwich Borough Council Electricity Department held its second annual dinner at the Old Town Hall, on March 27th. Mr. S. H. Penning, A.M.I.E.E. (deputy borough electrical engineer), presided, and he was supported by the Mayor of Woolwich (Councillor W. Barefoot, J.P.), Councillor T. Davis (chairman of the Electricity Committee), Alderman T. Watt (vice-chairman of the Electricity Committee), Councillors J. Newman, R. W. Marsh Allen, V. Lisk and H. Sykes, Mr G. W. Keats (borough electrical engineer), Mr. J. C. Williams (Erith), Mr A. J. Abraham (Bexley), Mr. F. H. Edwards (Dartford), Messrs. L. C. Chasteauneuf and J. A. Turnbull. The chairman proposed the toast "His Worship the Mayor of Woolwich," and the Mayor expressed the thanks of the Council to the staff for the success of the electricity undertaking. Councillor T. Davis proposed the toast of "The Electricity Undertaking and Borough Electrical Engineer," and said that this year the undertaking was giving the ratepayers an "Easter egg" of £25,000. Mr. Keats, in responding, stated that the Woolwich undertaking was second in London and seventh in Great Britain for efficiency, a position which was a great credit to the men in every department. Furthermore, the Woolwich undertaking had carried out more pioneer work than any undertaking in the Kingdom. He referred particularly to the all-electric houses at Eltham. Alderman T. Watt proposed the toast of "The Staff and Employees of the Electricity Undertaking," and Mr. S. H. Penning replied. Mr. G. R. Smith proposed the toast "Our Guests," and Mr. J. C. Williams responded. An excellent musical programme was carried out.

The annual dinner of the staff of the Ilford Council's Electricity Department took place on March 29th. Mr. A. Shaw, the chief electrical engineer, was in the chair, and during the course of the function was presented with an oak bureau cupboard to mark his completion of 25 years in his present position. A number of speakers testified to Mr. Shaw's ability and the progress of the Department under his guidance. A first-class musical entertainment was provided.

Polish Foreign Electrical Trade.—*The Board of Trade Journal* reports that the imports of apparatus, conductors, and other electrotechnical materials into Poland during January were valued at 2,267,000 zloty (about £60,000), and the exports of these goods at 96,000 zloty.

Copper, Lead, and Rubber Prices.—Messrs. F. Smith and Co. report, April 7th: No change in electrolytic copper prices.

Messrs. James & Shakespeare report, April 7th: Copper bars (best selected), sheet, and rod, no change; English pig lead, £31 5s., 10s. dec.

Messrs. Edward Till & Co. report, April 7th: India-rubber, Para fine, 2s. 2½d., ¼d. dec.

Lighting and Power Notes.

Aberdeen.—WIRING OF SMALL HOUSES.—The Corporation Electricity Committee has recommended the introduction of a scheme by which the Town Council will wire houses through private contractors on the deferred payment system.

Accrington.—NEW SUB-STATIONS.—New sub-stations are being erected in Sydney Street at an estimated cost of £1,600; in Willows Lane, at a cost of £887; and in Oswaldtwistle, at a cost of £1,640.

Argentina.—BUENOS AIRES.—A contract has been signed with the Compania General de Obras Públicas for the construction of a hydro-electric power station at the Port of Buenos Aires. Five 130,000-h.p. generators are to be installed. Two sets only will be proceeded with at first, one of which, it is expected, will be in operation by the end of 1927.—*Reuter's Trade Service* (Buenos Aires).

Barking.—PRICE REDUCTION.—The Urban District Council has reduced the charge for electricity to small consumers for lighting from 7d. to 5d. per kWh.

Beckenham.—LOAN.—The Electricity Committee has decided to apply for sanction to an additional loan of £20,000 for mains and services.

Bexley.—NEW ELECTRICITY TARIFF.—The Urban District Council has adopted a new tariff for the supply of electricity. Lighting for domestic and business purposes is to be charged at a flat rate of 6½d. per kWh, and heating and cooking at a flat rate of 1d. There will also be a contract rate of 2s. 6d. per quarter for each 50 watts or portion thereof installed for lighting purposes, plus 1d. per kWh for electricity consumed for lighting, heating, power, &c.

Blackburn. — LOAN. — The Corporation is applying for sanction to the borrowing of £100,000 for mains and services.

Bognor.—PRICE REDUCTION.—The Bognor Gas Light and Coke Co. has reduced the price of electricity for lighting to 7d. per kWh, flat rate.

Chester.—OBJECTION TO SCHEME.—At a recent meeting of the Electricity Committee, the town clerk stated that he had sent a letter of protest to the Electricity Commissioners against the proposal of the North Wales Power Co. to erect a transmission line from Helsby to Crewe, passing through the area in which the Corporation was seeking powers to supply electricity, before the Corporation had had the opportunity of stating its case in support of its application.

Cirencester. — ELECTRICITY SUPPLY. — The Rural District Council has consented to the applications of the West Gloucestershire Power Co., Ltd., to supply electricity in the Council's area, and the Cirencester Electric Supply Co., Ltd., for the extension of its overhead mains to Stratton.

Continental.—SWITZERLAND.—The Swiss Government has granted a concession to Buss & Co., of Basle, and the Lonzawerke Gesellschaft, of Waldshut, for the establishment of a new hydro-electric station at Rekingen on the Rhine, to utilise the power of the river between Eglisau and Rheinfelden. The capacity of the plant will be about 43,000 h.p.

BELGIUM.—The Société de Gaz et d'Electricité du Hainaut reports that during the past year concessions were secured for the supply of electricity to five additional communes, bringing the total supplied up to 69. Work on the new power station at Farciennes has been somewhat delayed by labour disputes, but it is expected to be ready for operation within a few weeks.

AUSTRIA.—It is proposed to establish a large central electricity station at the coke-making plant at the Ignatz collieries of the Berg und Huttenwerk Gesellschaft at Marienberg, near Mahr-Ostrau. The electricity generated is to be transmitted to the distribution system of the Mahrisch-Schlesischen Elektricitats Gesellschaft.

Dalkeith.—PURCHASE OF UNDERTAKING.—The Town Council, on April 1st took over the control of the electricity undertaking which has been purchased from the Electric Supply Corporation, Ltd., at a cost of £18,000. Mr. R. Smith is resident engineer. An agreement has been entered into with the Lothians Electric Power Company for a bulk supply of electricity. Messrs. Buchan & Partners, Edinburgh, are the consulting engineers.

Eccles (Lancs.).—LOAN.—The Town Council has applied for sanction to a loan of £6,000 to replace the original mains laid down in 1893.

Glossop.—PROPOSED PURCHASE OF UNDERTAKING.—The Corporation has appointed a committee to carry out negotiations with regard to the proposed purchase of the local electricity undertaking.

Hardingstone.—ELECTRICITY SUPPLY.—The Rural District Council has granted permission to the Northampton Electric Light & Power Co., Ltd., to erect overhead cables at Quinton and Courteenhall, and overhead and underground cables at Roade for the supply of electricity.

Harwich.—LOAN.—The Electricity Committee is applying for sanction to the borrowing of a further £1,000 for electricity services.

High Wycombe.—PRICE REDUCTION.—The High Wycombe Electric Light & Power Co. has announced a reduction in the price of electricity for lighting, from 9½d. per kWh for the first 100 kWh per quarter, and 9d. beyond, to 9d. and 8d. respectively.

Leeds.—ELECTRICITY SUPPLY.—In connection with the City Council's proposal to erect a new power station on Red Cote Farm estate, the Electricity Commissioners have intimated their reluctance at the present time to favourably consider an application for sanction to proceed with the construction of a new electricity generating station, being of the opinion that the present shortage of generating plant in Leeds and neighbouring towns can be temporarily met by linking up the various centres, and have requested the undertakings concerned to allow their engineers to meet in conference to consider this suggestion and, if possible, to submit their conclusions to the Commissioners at an early date. The Committee has decided that the manager be instructed to attend the conference.

The Committee has recommended the acquisition of the Red Cote Farm estate, at a cost of £18,500, for electricity purposes.

Llandudno.—ELECTRICITY CHARGE.—The Llandudno and Colwyn Bay Electric Railway, Ltd., has written to the Council pointing out that the reduction in the price of the electricity offered by the Council is inadequate, and suggesting that, having regard to the requirements of the company and to the fact that the supply is taken at the switchboard at the works, the rate should not exceed 1.20d. per kWh. The Electricity Committee has decided to adhere to the terms agreed to at its last meeting. It was decided to call the attention of the company to the amount outstanding for electricity supplied and to ask for an early settlement.

Mansfield.—WIRING OF SMALL HOUSES.—The Town Council has adopted a scheme for the assisted wiring of houses for electric lighting. The scheme is to apply only to houses and shops already supplied with gas, and not to new property, and the additional charge will be 2d. per kWh. Consumers will buy their own lamps after the first installation, and for a period of six months contracts are to be entered into with local firms for the wiring of blocks of houses on the Chesterfield lines.

Special Orders.—Application has been made to the Electricity Commissioners for a Special Order by the Farnham Gas and Electricity Co. authorising it to supply electricity in certain parts of the rural district of Farnham.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Brecon Corporation to supply electricity in the borough and in the parishes of Castle Inn and Christ's College in the urban district of Brecknock; the South Wales Power Distribution Co., in the parish of Llantrisant, in the rural district of Llantrisant and Llantwit Fardre; the Bedford Corporation, in the urban district of Ampthill and parts of the rural districts of Ampthill and Biggleswade.

Tilbury.—ELECTRICITY SUPPLY.—The Urban District Council has decided to enter into an agreement with the County of London Electric Supply Co., Ltd., for a supply of electricity, and to take the necessary steps to apply for a Special Order to supply electricity in the town.

Twickenham and Teddington.—ELECTRICITY CHARGES.—As a result of the recent inquiry, the Ministry of Transport has fixed the maximum rate to be charged for electricity by the Twickenham and Teddington Electric Supply Co., Ltd., at 9d. per kWh. The company has given notice that the following scale of charges has been adopted from the reading of meters at the end of the March quarter:—Lighting, 8d. per kWh, subject to a reduced minimum charge. Power: First 3,000 kWh per quarter, 2½d.; next 30,000, 2d.; above this amount, 1½d. Contract tariff: 2d. per kWh. Heating: First 100 kWh per quarter, 3½d.; beyond, 2d.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—According to the *Electrical World*, plans are under way for a consolidation of the Carolina Power and Light Co., the Yadkin River Power Co., the Asheville Power and Light Co., the Pigeon River Power Co., and the Carolina Power Co. The new company will be called the Carolina Power and Light Co., and steps will be taken immediately on construction work, which will involve the expenditure of approximately $20,000,000. Included in the contemplated construction work is a new hydro-electric plant on the Yadkin River at the Norwood site. This plant is to be designed for an ultimate capacity of 85,000 kW. The initial installation will be 63,000 kW. Another hydro-electric plant on the Pigeon River on a site near the Tennessee State line will be constructed. This plant will be designed for an ultimate generating capacity of about 75,000 kW, and will have an initial installation of 50,000 kW.

Uttoxeter.—Electricity Supply.—The Power Development Co., Ltd., has informed the Rural District Council of its intention to apply for a Special Order to distribute electricity in the rural districts of Uttoxeter, Cheadle and Stone, and in the urban district of Uttoxeter, and has asked for an opportunity of discussing the matter with the Council, whose consent is asked for. The Council has decided to await the decision of the Urban District Council on the matter.

West Lancashire.—Electricity Supply.—The Rural District Council is to apply for an Order to enable the townships of Maghull and Lydiate to obtain a supply of electricity from the Liverpool Corporation at the Aintree boundary. At a recent meeting of the Council it was objected that the price proposed by the Liverpool Corporation was 2¾d. per kWh, whereas a cheaper supply might be obtained from the L.M. & S. Railway Co., which was supplying Formby at ¾d. per kWh. The clerk said that the Council was already pledged to go forward with the scheme.

Wetherby.—Electricity Supply.—At a recent meeting of the Rural District Council notice was received from the Electricity Commissioners that they were granting the Electrical Distribution of Yorkshire, Ltd., power to supply electricity to Wetherby. The company has issued notice of its intention to commence laying mains at Collingham, Linton, Wetherby, Thorner, Boston Spa, and East Keswick within a month.

Tramway and Railway Notes.

Blackpool.—Tramway Improvements.—The Corporation proposes to spend £143,808 on tramway improvements during the next financial year. The proposed improvements include new cars and equipment, £15,650; mineral sidings, £16,698; permanent way renewals, £65,601; South Shore tramway extension, £10,809; new motor 'buses, £13,000; and new garage, £12,000.

Cardiff.—New Cars.—The Tramways Committee is to purchase 30 single-deck tramcars at an estimated cost of £73,050.

Continental.—Switzerland.—Negotiations are in hand in connection with the electrification of the railway between Munster and Lengnau.

Austria.—The Austrian State Railway authorities have recently put in operation four electric locomotives, for use in connection with express trains, which embody the use of vertical spindle motors. The engines are intended for use on hilly sections, on which they are required to pull a 500-ton train at 25 m.p.h. and a 300-ton train at 28 m.p.h., the maximum speed on the level being 53 m.p.h. They are of the six-axle type, the central four being each separately driven by an electric motor through bevel gearing, a special flexible connection being provided between the bevel wheels and the axles. The brush gear is located at the upper end of the motors. The engines weigh 91½ tons and have an overall length of 46 ft. and a wheel base of 36 ft. The front and rear pairs of wheels are 3 ft. 5 in. in diameter and the driving wheels 4 ft. 5in.

Edinburgh.—Tramway Extension.—The new extension of the Corporation tramway system from Craiglockhart to Colinton was recently inaugurated.

Japan.—Tokio.—The Tokio correspondent of the *Daily Mail* reports that the first section of the Tokio subway system will be completed in June next year, and regular service over this section, a mile and a half long, will start in the following month, according to a statement by the managing director of the company constructing the new service. A 4-minute service, with trains to accommodate 600 passengers, is planned.

Osaka.—The Osaka municipal officials have approved in principle of the formation of a company, to construct an underground railway in the city.

Maidstone.—Railless Cars.—The Town Council is recommended to install railless cars on the Barming route, where overhead lines are at present in use, at an estimated cost of £18,662.

Salford.—Through Running.—Arrangements are now complete for the new tramway service between Salford and Walkden. The through service is the outcome of negotiations between Salford Corporation and the Lancashire United Tramway Co. It is hoped to run a similar service between Bolton and Salford, and this will entail the doubling of the existing tramway track.

United States.—New Electric Railway.—According to *Electric Traction*, an electric railway for Florida is being planned. This proposed line would link up central Florida cities with the east and west coast and open up the great ridge and lake sections of interior Florida. A corporation to be known as the Florida Service Electric Railways Company will be formed with a capital of $10,000,000. The line is to be constructed in three sections. The first will run from Orlando through Apopka and north to Palatka, the second from Orlando to Tampa and St. Petersburg, and the third through Sanford to Daytona Beach and ultimately link up with Jacksonville to the north with Miami as its Southern terminus.

Philadelphia Subway Extensions.—Extension of the Broad Street subway, Philadelphia, is proposed at an additional cost of $20,117,000. This estimate includes the construction of a two-track line under the east side of the street, five stations at half-mile intervals, and operating equipment. The present subway under construction will cost $100,000,000.

Uruguay. — Railway Electrification. — The State-owned railway between Montevideo and Santiago-Vazquez is to be electrified. The work will be undertaken on behalf of the State by the Compañia Tranvias la Transatlantica of Montevideo.—*Reuter's Trade Service* (Montevideo).

Telegraph and Telephone Notes.

Canada.—Storm Damage.—Sleet and wind storms swept Central and Eastern Ontario, portions of Quebec, and the maritime provinces on March 31st. The telephone and telegraph companies were the chief sufferers owing to the unprecedented destruction of poles carrying the wires. In the Toronto district alone over 1,200 telegraph and telephone poles came down, and all services were badly interrupted.—*Reuter* (Toronto).

Czecho-Slovakia.—Telephone Economy.—Owing to the need for economy, the telephone cable extension programme for 1926 of the Czecho-Slovakian Post and Telegraph Department has been materially cut down. The line between Prague and Brunn is, however, being extended to Iglau; a cable is also being laid between Prague and Aussig to provide a connection at Dresden with the German telephone system. It is also contemplated to lay a cable between Prague and Pilsen to provide another connection with Germany at Plauen.

Germany.—Telegraph Cable.—The German Atlantic Telegraph Co., Berlin, reports receipts of 738,226 marks in 1924, and it is proposed to pay a dividend at the rate of 6 per cent. on the preference shares, as in the previous year. The directors state that the work of producing the cable that is to be laid between Emden and the Azores, where it is to be connected with the cable of the Commercial Cable Co. and the Western Union Telegraph Co., is in full course, and it is reckoned that the connection will be completed during the present year.

Guernsey.—Telephone Service.—The revenue statement and statistics of the State telephone department for the year ended December 31st, 1925, show the gross revenue to have been £16,730 (an increase of £837 on the previous year), and the net profit was £275 (£45 decrease). Subscribers' lines increased by 179 to 3,104 and the total number of lines, including junctions, by 227 to 3,730. Overhead metallic circuit wire increased by 62¼ to 2,385¼ miles, and the underground circuits increased by 778¼ to 3,928 miles. (Single wire mileages are double these figures.)

Holland.—Automatic Telephony.—The L.M. Ericsson Telephone Company has obtained a definite order for another automatic telephone station at Rotterdam, the value of the order being about Kr. 2,540,000. The Company has previously constructed two stations of this kind at Rotterdam.—*Reuter's Trade Service* (Stockholm).

Hull.—Automatic Equipment.—The Municipal Telephone Committee has received a report from the telephone manager to the effect that, in order to be in readiness for anticipated future demands, it has become necessary to advertise for tenders for additional automatic equipment. The proposal is for 2,000 lines of additional equipment, 40 per cent. to be installed in the existing premises at Wincolmlee, to relieve congestion in the Central exchange, and the remainder divided between two new exchanges situate in North and South Newington respectively. The manager has been instructed to advertise for tenders.

India.—The Telegraph System.—Our Indian correspondent reports that the Government of India is determined to rapidly modernise the telegraph system. The Creed-Wheatstone automatic system of working has been entirely replaced by modern multiplex systems, *i.e.*, Baudot, Murray and Murkrum; laboratory experiments on the Echelon method of working (*i.e.*, between more than two stations on the same wire) have been carried out with a view to its early introduction. A considerable amount of experimental work has been carried out with Baudot re-transmitters in the Research Laboratory; a four channel set, with single-disk distributors, has been designed and tried in conjunction with two quad terminal sets through artificial lines. After a number of preliminary trials, a scheme of connection has been evolved which has now been adopted with entire success as the standard in the Department. Experiments in connection with multiplex working were also carried out in the laboratory with Western Electric valves and relays and with valves only; the experiments were very encouraging.

When purchasing stores, increasing use is being made of local sources of supply: The value of stores purchased locally rose from Rs. 5 lakhs in 1923-24 to Rs. 12 lakhs in 1924-25, while the value of stores obtained on English indent fell from Rs. 27½ to Rs. 18¼ lakhs. Hard-drawn copper line wire is now being manufactured satisfactorily in India, and over 600 tons of this wire of local manufacture was purchased by the Department in 1924-25. Glass battery jars of local manufacture are also being obtained. The telegraph workshops show an increased output. The training of men in the manufacture of

high-speed apparatus has been very successful, and complete Baudot instruments and all spare parts, which were previously received from England, are now manufactured at the workshops at very favourable rates. A special machine was designed and made in the workshops to convert Wheatstone tape into Baudot tape, to prevent the loss which would have been incurred by scrapping a large stock of Wheatstone tape. In the construction branch of the workshops, 30,020 galvanised tubes for telegraph poles, and 185,214 brackets with fittings for supporting line wires were made. The output from the iron foundry weighed 664 tons.

The total line and wire mileages of the Indian telegraph system were at 94,037 and 477,839, respectively, on March 31st, 1925. There has been a considerable increase in traffic recently.

Radio-telegraphy. — RUSSIAN SERVICE. — It has been announced by Marconi's Wireless Telegraph Co., Ltd., that a radio-telegraph service from London to Moscow (Russia) was inaugurated on March 31st. Commercial and private messages are accepted at any Marconi office.

Russia.—SHORT-WAVE RADIO EXPERIMENTS.—For some time past experiments with short waves have been in progress at the Russian Soviet Government Laboratory at Nishni-Novgorod and it is reported that by the use of a 1,520-W transmitter devised by Prof. Bontch-Brouyevitch (head of the laboratory) and Herr Tabarinow, messages have been successfully transmitted to Chile and Porto Rico on wave-lengths of 83, 102, and 104 metres. The object of the experiments is to provide a practicable form of radio communication with remote parts of Soviet Russia which are not provided with telegraph communication. Prof. Boutch-Brouyevitch is also reported to be experimenting with a 100-W transmitter for use at the Chabolovka radio-telegraph station, near Moscow.

The Telegraph Service.—FOREIGN TELEGRAM RATES.—The Postmaster-General has announced that on April 1st the rates of charge for ordinary telegrams to Italy, Switzerland, Albania, Bulgaria, Danzig, Esthonia, and Jugo-Slavia, were increased by ½d. a word, and the rate to Turkey by 1d. a word. These increases were necessitated by the decision of the International Telegraph Union to raise the maximum terminal rates chargeable by the various European administrations for telegrams passing between them.

The Telephone Service.—BIRKENHEAD POLICE SYSTEM.—The Birkenhead Corporation recently installed a Relay automatic telephone equipment at the Central Police Office. The automatic system, which replaces the former common-battery method, serves 77 departments, all of which are able to communicate directly with each other without the interference of an operator The arrangement embraces an automatic switchboard which replaces the former branch exchange and a smaller manual board, which deals with incoming and outgoing calls. The reorganisation is estimated to have cost over £2,000.

LONDON CHANGES.—An important alteration in the telephone system of London came into operation on March 29th. Within a radius of ten miles from Oxford Circus all telephone numbers now consist of a minimum of four figures. For example, "Central 56" becomes "Central 0056," which alteration has been necessitated by the coming introduction of the automatic telephone. Last year the names of certain exchanges were altered, and numbers composed of single figures were abandoned. A new exchange, to be known as Primrose Hill, has been installed to relieve Hampstead. Some 900 subscribers have been taken over, and the exchange will be extended until it deals with some 3,000 subscribers.

LONDON SUBSCRIBERS.—On March 31st there were 486,800 telephone subscribers in the London area, and they were increasing at the rate of 1,000 per week; it is declared that there are now six subscribers in London to every 21 in New York per 100 of population. London is, however, ahead of Berlin and Paris.

Radio Notes.

Australia.—NEW STATION.—A new radio-broadcasting station was opened in Sydney on March 30th.

Pennant Hill is the location of the station, which has an aerial 400 ft. high, and its maximum power is 10 kW. Reports from British listeners who may hear this transmitter will be welcomed by the B.B.C.

Frequency Control.—QUARTZ CRYSTAL METHOD.—The recent international decision to redistribute wave-lengths by the allocation of exclusive and common wave-lengths in Europe adds interest to methods of controlling transmitter frequencies. In this connection the first high-power station to utilise a quartz crystal for this purpose is the American General Electric Co.'s development plant, which is known as WGY. A piece of quartz crystal, less than one inch square and ground to a thickness a shade less than an eighth of an inch, is controlling the 50-kW transmitter's 790-kilocycle frequency assigned to the station by the United States Department of Commerce. Quartz has been utilised for controlling the regular 5-kW transmitter of WGY for several months. Beside the large transmitter's bank of eight 20-kW water-cooled tubes are two small copper-covered cabinets with dials, switches, and meters built in their faces; one of these boxes contains the crystal and a single exciting tube; in the second box is a single amplifying tube, while successive stages of amplification up to 1 kilowatt are placed in separate panels. The small slab of quartz crystal is enclosed in a metal chamber and is connected to work directly on a 5-watt tube, which, in combination, act as a high-frequency generator whose output is determined by the contraction and expansion of the crystal. The interaction of crystal and tube may be described as the setting up of a mechanical force, which is converted into an electrical force of a definite fixed frequency dependent upon the dimensions of the piece of crystal used; the thinner the crystal the higher the frequency. The five-watt tube that is directly connected to the crystal works into a 50-watt tube, resulting in the amplification of the original energy at the fixed frequency. Still further amplification is obtained by connecting the 50-watt tube to a 250-watt tube, and then a fourth stage is secured by connecting the output of the latter to a 1,000-watt tube; all the valves used up to this point are air cooled. In the next stage a metal water-cooled tube rated at 20 kW is introduced as a part of the transmitter; it was formerly used as the master oscillator (a self-excited generator), but now is excited by the preceding stages of crystal amplification, and the 20-kW tube then excites the bank of eight 20-kW power tubes of the transmitter. The General Electric Co., of America, claims to have demonstrated that crystal control may be successfully adapted to any practical power; besides the reduction of inter-station interference, there is also evidence that fading tends to decrease when the frequency is constant.

Holland.—BROADCASTING AGREEMENT.—The Commercial Secretary at The Hague (Mr. R. V. Laming, O.B.E.) informs the Department of Overseas Trade that a new contract has been concluded between the N.V. Nederlandsche Seintoestellenfabriek (of Hilversum) and the Hilversumsche Draadlooze Omroep, which terminates the contract of May, 1925, between the parties mentioned, to be operative from March 1st, 1926. Article 1 places at the disposal of the H.D.O. certain hours per week for transmission purposes, and the N.S.F. binds itself to allot the remaining hours for transmission to the H.D.O. as desired, in so far as they are not already granted to others, and not to grant the use of the transmitting apparatus to other bodies before having given the H.D.O. the option of refusal. Article 2 stipulates that so soon as the Government grants permission for the use of the second transmitter, it shall be ready for use by the H.D.O. within two months thereof, but in any case not before June 1st, 1926; it will operate on the same wave-length as the existing transmitter, and with at least the same capacity in the aerial. The H.D.O. guarantees a minimum of 31 hours per week for the old transmitter at present in use. The N.S.F. is to see that the old and new transmitters function properly, including the provision of the material and *personnel* for the control thereof. The H.D.O. binds itself not to utilise the transmitter for advertising on behalf of firms or persons competing with the N.S.F., to submit its weekly programmes fourteen days in advance to the N.S.F., and to remunerate the latter for the use of the old and new transmitters, *personnel*, materials, licence, studio, and a maximum of two line transmissions per 31 hours on the old transmitter, and 40 hours on the new transmitter. On the eventual conclusion of a permanent contract with a probable national broadcasting body, the present contract is not to be referred to as a precedent.

Licences.—STILL INCREASING.—The number of broadcast radio-telephone receiving licences in force in Great Britain on February 28th was 1,906,000; when the March returns are available it is expected that they will record over 2,000,000.

Venezuela.—BROADCASTING CONCESSION.—A concession has been granted to a native company to establish and develop broadcasting in Venezuela. The Government proposes to erect a high-power station in Caracas and stations in each of the other States. Hitherto there have been no privately-owned radio-telegraph stations, clubs, or societies in the Republic, although permission has been given to one or two oil exploration companies to erect radio-telephone stations exclusively for communication between the oilfields and their offices. Hitherto this permission has not been availed of.—*Reuter's Trade Service* (Caracas).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—June 16th. City Council. Turbo-alternator, exciter, and condensing plant.*

Barking.—April 20th. County of London Electric Supply Co., Ltd. Circulating-water pumps and pump-house equipment, circulating-water screening plant, and boiler-house and coal-handling plant. (March 19th.)

May 10th. Coal-unloading, storing, and reclaiming plant. (See this issue.)

May 11th. Switchgear and accessories, transformers and piping equipment. (March 26th.)

Belfast.—April 17th. Electricity Department. Automatic rotary converters with transformers, h.p. and l.p. switchgear and automatic control gear. (March 26th.)

Belgium.—April 14th. Belgian State Railway authorities (Office de l'Electricité), 25, Rue de la Charité, Brussels. 60 kilometres of lead-covered electric wire. Particulars on application for Cahier des Charges Special, 4-326.

Bentley-with-Arksey.—April 20th. West Riding Education Committee. Electric lighting installation at Bentley Road school. Specifications, Education Department, County Hall, Wakefield.

Bolton-upon-Dearne.—April 22nd. Dearne District Electricity Board. Electric cables and accessories. (April 2nd.)

Bristol.—April 16th. Electricity Department. 140 14 in. ×14 in.×35 ft. ferro-concrete piles. (See this issue.)

Chile.—Santiago.—August 20th. Chilean State Railways. Signals, telegraphs and telephones, electrical material for sub-stations, aerial lines, and lighting.*

Dartford.—April 21st. Electricity Department. Coal for 6 or 12 months. (See this issue.)

Dover.—April 14th. Electricity Department. 6,250 yd. e.h.p. cable. (March 26th.)

Dundee.—April 20th. Education Authority. Electric lighting at new central Advanced School at Blackness Road. Schedules from Messrs. Maclaren, Soutar & Salmond, architects, 16, South Tay Street, Dundee.

Exeter.—May 11th. Electricity Department. Boiler-house plant complete:—Two water-tube boilers with economisers, pumps, coal bunkers, conveyor, and accessories. Self-supporting steel chimney, induced-draught fan, and accessories. (See this issue.)

Ferry Fryston (Yorks.).—April 20th. West Riding County Council. Electric lighting installation at Ferry Fryston, Airedale, new school. Specifications from Education Department, County Hall, Wakefield.

Glasgow.—April 13th. Lighting Department. Materials for one year from June 1st, including electrical fittings and accessories. Specifications, &c., from office of Lighting Department, 20, Trongate.

Halifax.—April 12th. Town Council. Wiring for electric lighting of 80 houses, Booth Lane and Nursery Lane. Particulars from Mr. P. Saunders, town clerk, Town Hall.

Harrogate.—April 25th. Electricity Department. H.p. and l.p. switchgear for sub-stations. (See this issue.)

Hull.—Telephones Committee. Supply and installation of automatic telephone exchanges. (April 2nd.)
April 15th. Electricity Committee. 36-in. c.i. pipework, chamber and penstock. Form of tender, &c., from Mr. H. Bell, city electrical engineer and manager, Electricity Works, Sculcoates Lane, Hull.

India.—April 30th. India Store Department. 22,000-V cables. (April 2nd.)
May 7th. 15 motor coach underframes and bodies, 30 motor bogie trucks. (March 12th.)
May 14th. Three 5-kW oil engine-driven generator sets, one switchboard, and two pumping sets.*

Irvine (Ayrshire).—April 12th. Town Council. Electric lighting installation at 25 blocks, consisting of 100 houses. Plans from Mr. Robert Frew, architect, 3, High Street, Irvine.

London.—Hammersmith.—April 14th. Electricity Department. H.p. insulated cables, air-cooled and oil-cooled transformers, and h.p. sub-station switchgear. (April 2nd.)

Manchester.—April 13th. Tramways Committee. Copper, silicum, and cadmium bronze trolley wire. Forms of tender from Mr. H. Mattinson, general manager, 55, Piccadilly.

Middlesbrough.—April 16th. Electricity Department. Six or 12 months' supply of cables and 12 months' supply of meters. (March 26th.)

New Zealand.—June 21st. Auckland Electric Power Board. L.p. insulators, &c.*
Wellington.—May 12th. Post and Telegraph Department. 18 switchboards.*

Perth.—April 12th. Electricity Department. One water-tube boiler, capacity 27,000 lb. per hour. (April 2nd.)

Salford.—Corporation Gas Department. One 5-cwt. electric passenger lift at Bloom Street offices. Form of tender from Gas Engineer, Gas Offices, Bloom Street.

Southend-on-Sea.—April 19th. Electricity Department. 1,450 current limiters. (April 2nd.)

Spain.—Madrid.—May 9th. Compania de los Caminos de Hierro del Norte. Overhead line, converting sub-stations, locomotives and motor coaches for the electrification of the lines from Barcelona to Manresa and San Juan de las Abadesas in one contract. The constructors are to obtain as many of their supplies from Spanish industries as possible.—*Reuter's Trade Service* (Madrid).

Stoke-on-Trent.—April 13th. Electricity Department. 12 months' supply of mains and cables, a.c. and d.c. meters, sub-station switchgear, and static transformers. (March 26th.)
April 12th. Gas Committee. Electrical and other machinery, gas engine and dynamo. Contract No. 35. Particulars (20s.) from the Chief Gas Engineer, Gas Works, Etruria, Stoke-on-Trent.

Walthamstow.—April 13th. Electricity Department. Steel overhead bunkers and boiler-house buildings; and coal- and ash-conveying plant. (March 12th.)

Warrington.—April 26th. Electricity and Tramways Committee. L.p. paper and lead-covered cables. (See this issue.)

Waterford.—May 12th. Electricity Department. Two 250-kVA, 3-phase alternators direct coupled to heavy oil engines, e.h.p. mains and l.p. underground distribution system, transformer kiosks, pillars, street lighting services, l.p. overhead distribution system, &c. (See this issue.)

Westhoughton (near Bolton).—April 14th. Urban District Council. Metallic-filament lamps required during year ending March 31st, 1927. Form of tender, &c., from Mr. G. Hayes, surveyor, Council Offices.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Barking.—Electricity Department. Accepted:—
L.p. switchgear.—Edison Swan Electric Co., Ltd.

Belfast.—Corporation Tramways. Accepted:—
Incandescent lamps.—Edison Swan Electric Co., Ltd.

Bury.—Town Council. Accepted:—
Electric lighting installation, Fishpool housing scheme.—Direct Electric Service, Ltd.
Coal for the electricity works.—Wigan Coal & Iron Co., Ltd.

Cardiff.—Electricity Committee. Accepted:—
10,000-kW turbo-alternator (£31,301).—Fraser & Chalmers Engineering Works (General Electric Co., Ltd.).
Condensing plant (£6,791).—Cole, Marchent & Morley, Ltd.
Dust collectors (£1,600).—Davidson & Co., Ltd.

Hastings.—Town Council. Accepted:—
Electrical cooking apparatus for White Rock Pavilion (£811).—Jackson Electric Stove Co., Ltd.
22,000-V, 3-phase overhead lines and cables (£26,554), e.h.p. and l.p. underground cables (£24,658).—W. T. Glover & Co., Ltd.

Hull.—The City Council, to whom the Telephones Committee had referred the selection of tenders for telephone equipment, accepted the lowest British offers in preference to German tenders, which were stated to be 48 per cent. cheaper. The contracts were awarded to Messrs. W. T. Glover and Co., Ltd., the Union Cable Co., Ltd., and Bullers, Ltd.

Telephones Committee. Accepted:—
Dial switches (£146).—Siemens Bros. & Co., Ltd.
Wall telephones (£174).—British L. M. Ericsson Mfg. Co., Ltd.

Leeds.—Tramways Committee. Accepted:—
Traction lamps for car lighting for 12 months.—Siemens & English Electric Lamp Co., Ltd.

London.—Admiralty.—Accepted:—
Switchboard for Devonport Dockyard.—Edison Swan Electric Co., Ltd.

Stepney.—Electricity Supply Committee.
Two 150-kVA transformers (£348).—Hackbridge Electric Construction Co., Ltd. (accepted).
100 single disconnecting boxes (£115).—W. Lucy & Co., Ltd. ((recommended).
50/TC/C disconnecting boxes (£107).—Universal Electrical Manufacturing Co. (recommended).
Cables for 12 months (£27,611).—W. T. Henley's Telegraph Works Co., Ltd. (recommended).
3,000 maximum demand indicators.—Reason Manufacturing Co., Ltd. (recommended).

Manchester.—Electricity Committee. Accepted:—
Cable.—Hackbridge Cable Co., Ltd., and Callender's Cable & Construction Co., Ltd.
Equipment of louvre doors for cooling tower at Stuart Street.—Clyne Engineering Co., Ltd.
E.h.p. switchgear for Oldham Road a.c. sub-station.—A. Reyrolle & Co., Ltd.
Refractor street lanterns.—General Electric Co., Ltd.; Wardle Engineering Co., Ltd.

Tramways Committee. Accepted:—
Motor controller spare parts.—British Thomson-Houston Co., Ltd.; General Electric Co., Ltd.; Metropolitan-Vickers Electrical Co., Ltd.
Tram rail bands.—T. Bolton & Sons, Ltd.; Forest Clay Electric Co., Ltd.

Housing Committee. Accepted:—
Electric light installation at Moston and Burnage estates.—Mr. J. V. Pyatt.

Margate.—Town Council. Accepted:—
Wiring and fitting 72 houses for electric light (£4 7s. 6d. per house).—W. J. Cannon & Co.

Research in Australia.—Sir Frank Heath, Secretary of the Department of Scientific and Industrial Research, reporting to the Australian Federal Government as special commissioner, recommends the development of the Science Institute into an important department resembling the British Research Departments and co-operating with them. The annual cost, which would begin at £40,000, would rise to £100,000, says the *Daily Mail*. Sir Frank Heath suggests the appointment of a scientific expert on the staff of Australia House in London, and thinks that the recent creation of a research committee of the British Cabinet as a civil counterpart of the Imperial Defence Committee makes such an appointment particularly necessary.

Forthcoming Events.

Electrical Power Engineers' Association.—Friday, April 9th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 7 p.m. Lecture on "Boiler-house Plant Developments in Association with Powdered Fuels," by Mr. F. H. Rosencrants.

Diesel Engine Users' Association.—Friday, April 9th. At Caxton Hall, Westminster, S.W. Paper on "Industrial Combustion Engines," by Mr. W. A. Tookey.

Chief Technical Assistants' Association.—Saturday, April 10th. At Holborn Restaurant, W.C. At 6.45 p.m. Annual dinner.

Society of Engineers.—Monday, April 12th. At Burlington House, W. At 5.30 p.m. Paper on "An Inquiry into the Ugliness of Engineering Structures," by Mr. H. B. Creswell.

Institution of Electrical Engineers.—INFORMAL MEETING.—Monday, April 12th. At the Institution, Victoria Embankment, W.C. At 7 p.m. Discussion on "The Linking Together of Wireless and Wire Communication Systems," to be opened by Capt. P. P. Eckersley.

(Wireless Section).—Wednesday, April 14th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "The Rugby Radio Station of the British Post Office," by Mr. E. H. Shaughnessy.

(North-Eastern Centre).—Monday, April 12th. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Lecture on "Some Impressions of Chicago and U.S.A.," by Mr. C. Vernier.

(Scottish Centre).—Tuesday, April 13th. At the Royal Technical College, Glasgow. At 7.30 p.m. Paper on "The Design of Electrical Plant, Control Gear, and Connections for Protection Against Shock, Fire, and Faults," by Mr. H. W. Clothier. Annual general meeting.

(Western Centre).—Monday, April 12th. At University College, Exeter. At 5.45 p.m. Lecture on "Electro-Farming: or the Application of Electricity to Agriculture," by Mr. R. B. Matthews.

(South-Midland Centre).—Wednesday, April 14th. At the University, Birmingham. At 7 p.m. Discussion on "The Government Electricity Bill."

Institution of Civil Engineers.—Tuesday, April 13th. At the Institution, Great George Street, S.W. At 6 p.m. Paper on "The Influence of Electric Welding in the Design and Fabrication of Plant and Structures," by Mr. J. N. Reeson.

Wednesday, April 14th. At 6 p.m. Informal meeting. Discussion on "The Young Engineer: His Training and Prospects," to be introduced by Mr. G. W. Tripp.

Radio Society of Great Britain.—Wednesday, April 14th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 6 p.m. Informal meeting.

Institution of Engineers-in-Charge.—Wednesday, April 14th. At St. Bride Institute, Bride Lane, E.C. At 7.30 p.m. Paper on "Modern Electric Wiring," by Mr. H. D. Wilkinson.

Saturday, April 17th. Social dance.

Meter Engineers' Technical Association.—Thursday, April 15th. At Anderton's Hotel, Fleet Street, E.C. At 7.30 p.m. General meeting.

Junior Institution of Engineers.—Friday, April 16th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "Automobile Lighting, Starting, and Ignition," by Mr. T. L. Allison.

Institution of Mechanical Engineers.—Friday, April 16th. At the Institution, Storey's Gate, S.W. At 6 p.m. Paper on "The Modern Development of Paper-mill Plant," by Mr. W. Worby Beaumont and Mr. L. N. Burt.

Salford Technical and Engineering Association.—Saturday, April 17th. At the Royal Technical College. At 7 p.m. Paper on "Switchboard Instruments," by Mr. A. H. Higgs.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, April 17th. At the South Wales Institute of Engineers, Park Place, Cardiff. At 6 p.m. Lecture on 'Auto-Synchronous Motors," by Mr. E. E. Tasker.

Notes.

Royal Air Force Cadetships.—The Air Ministry announces that the next examination of candidates for entry as flight cadets to the Royal Air Force Cadet College, Cranwell, in September, 1926, will begin on June 22nd, when not less than 35 cadetships will be offered. Forms of entry, obtainable from the Secretary, Civil Service Commission, Burlington Gardens, W.1, must be sent in not later than May 6th. Facilities are given to R.A.F. officers to specialise in, among other subjects, engineering and wireless telegraphy.

Lecture.—On Monday next, under the auspices of the Brighton and Hove Health and Food Reform Society, at the Hove Town Hall, Mr. H. G. Massingham will give a lecture on "The Past and Future Developments of Electricity and its Bearing on Pure Light, Pure Air, Pure Food and Health."

The Volta Centenary Celebrations. — Great preparations are being made in Italy to commemorate next year in suitable form the centenary of the death of the great Italian scientist, Alessandro Volta. All the leading scientific and technical associations are joining together in organising a comprehensive programme which will comprise, among other items, International Congresses on Physics, Telegraphy, and Radio Communication, while an International Exhibition of Electrical Communications is to be held in Como.

Appointments Vacant.—Three car-shed foremen (Rs. 650-40-850 per mensem) for the electrified services of the Indian State Railways. General assistant and draughtsman for the Newark-on-Trent Electricity Department. Lecturer in Electrical Engineering for the Bradford Technical College. Assistant engineer for extension work (£504) (temporary), and Draughtsman (£300) (temporary) for the Dublin Corporation Electricity Department. (See our advertisement pages today.)

Stockport Electricity Works.—OPENING OF EXTENSIONS.—A civic inspection of the new generating plant at the electricity works of the Stockport Corporation took place on Wednesday, March 31st, when the 12,000-kW turbo-alternator set, built by the English Electric Co., Ltd., was inaugurated. The visitors were received by Mr. Ralph Lomax (whose connection with the department dates from 1902 and who has been the borough electrical engineer since 1906) and his deputy, Mr. R. H. Lee, who explained the details of the plant. The plant includes three 5,000-kW turbines, one of 5,500 kW, and the new turbo-alternator, which is capable of a continuous output of 12,000 kW at 0.8 p.f., at a pressure of 6,000 volts, three-phase, 50 cycles, and runs at a speed of 3,000 r.p.m. New main switchgear is under erection, consisting of a remotely-controlled electrically-operated cubicle switchboard, supplied by the English Electric Co., Ltd. A Tudor battery of 3,000 ampere-hours has been installed. There are also two 1,500-kW and two 1,000-kW rotary converters of the English Electric Co.'s construction and one 1,000-kW La Cour converter by Messrs. Bruce Peebles & Co., Ltd.

A notable feature in the history of the Stockport electricity supply has been the way the capital charges have been kept down, with the result that last year there was a gross profit of 10.94 per cent. upon the capital expended and of 17.97 per cent. upon that outstanding. There are 7,714 consumers, and although the town has suffered from the prevailing depression in the cotton trade, the authorities are optimistic with regard to the future, and have provided plant to meet the coming needs. The cost of the new turbo-generator, new boilers, and structural alterations, will be about £100,000, and the cost per kW of plant installed works out at a little over £12. When the site is developed to its present accepted limits of 50,000 kW installed capacity it should work out at £10 per kW. During the last two years the supply of electricity in bulk has been extended to the Hazel Grove and Bramhall Urban District Council and the Bredbury and Romiley U.D.C., whilst supplies to the authorities at Marple and New Mills are under consideration.

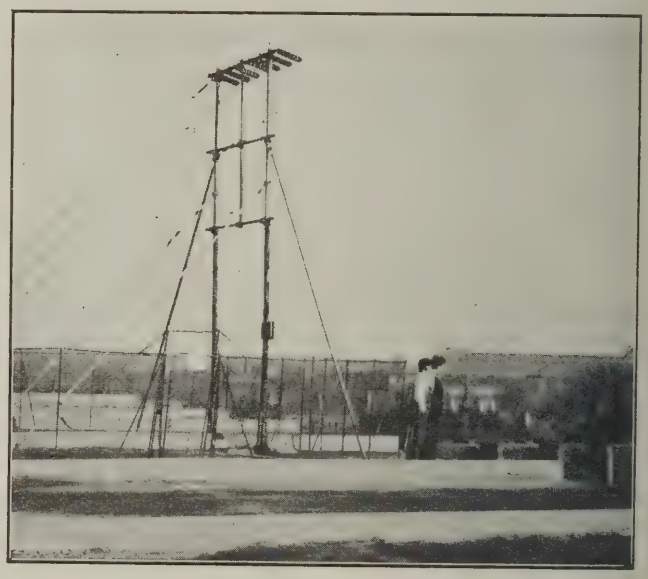
After the inspection of the new plant, Councillor James Harrison, as chairman of the Electricity Committee, christened the 12,000-kW turbo-generator the "George Ball," in honour of the first chairman of the Committee, and then started the machine. Subsequently luncheon was served at the Town Hall, when the Mayor (Councillor J. Greenhalgh, J.P.) presided over a full attendance of leading public men.

Mr. P. H. Symonds, in proposing "Success to the Stockport Electricity Undertaking," said that the Stockport station was the first of its size in order of merit according to the Electricity Commissioners. With regard to the Electricity Bill he hoped there would be as little control as possible. The electricity undertaking wanted to develop on sound commercial lines. Stockport enjoyed low capital charges, and tribute should be given to the sound commercial instincts of their electrical engineer, Mr. Ralph Lomax.

Alderman George Ball, who until recently was chairman of the undertaking from the first, replied, and said they would be able to generate a cheap and abundant supply of electricity for a long time to come. He eulogised the services of Mr. Lomax, whose advice had been most useful to the Committee.

The Optical Convention.—At the meeting of the Scientific and Technical Circle of the Institute of Journalists on March 29th, presided over by Mr. L. Gaster, a survey of the aims and objects of the Optical Convention, to be held at the Imperial College of Science and Technology from April 12th to 17th, was given. The British optical industry has for long had to contend with great difficulties, but from the scientific standpoint it is an exceedingly important one, and the vital consequence of "optical munitions" during the war was strikingly demonstrated. Recognition of its national value is afforded by the fact that the Prime Minister, Mr. Stanley Baldwin, is to open the Convention. At the meeting of the Circle, Mr. Frank Twyman, F.R.S., gave a good summary of the variety of apparatus, cameras, telescopes, microscopes, projectors, surveying instruments, &c., of which lenses form a part. Journalists should not forget that every process block also requires the use of an optical lens. Many of these instruments have done invaluable service in opening up new fields of knowledge. Professor F. J. Cheshire, in the course of an account of some experiences as director of the Department of Optical Munitions during the war, referred to their applications in range-finders. Generally speaking, the optical industry, like illuminating engineering, finds its main justification in the statement that before one can act one must *see*.

At the Convention there will be many papers and exhibits of scientific interest. Public interest is to be aroused by many ingenious optical illusions and entertainments, some of which were described at the meeting by Sir Richard Paget. One of the most attractive of these is the "Fairy Theatre," wherein fairy figures only 6 inches high will perform; these dramatic performances have been arranged with the assistance of Mr. Kenneth Barnes, M. Komisarjevsky and the students of the Royal Acadamy of Dramatic Art. Amongst the exhibitors will be Messrs. C. A. Parsons & Co., Ltd. (searchlight reflectors), Henry Hughes & Son, Ltd. (compasses, sounding machine), the Cambridge Instrument Co., Ltd. (pyrometers, photometers, &c.), the Foster Instrument Co. (pyrometers), the Thermal Syndicate, Ltd. (mercury pumps, wireless valves in fused quartz, &c.); and the National Physical Laboratory, the Imperial College technical optics department, the Illuminating Engineering Society, and other scientific bodies will be represented in the Experimental and Research Section.



Nitrogen Fixation.—Speaking at the Princeton Chemical Club, U.S.A., Dr. Frederick G. Cottrell, chairman of the Fixed Nitrogen Research Laboratory at Washington, estimated that approximately 44 per cent. of the world's inorganic supply of nitrogen would be obtained this year by atmospheric fixation, against less than one-fourth that amount

before the war. While the 10 per cent. made in this way before the war was almost wholly by the arc and cyanamide process, nearly 70 per cent. of this year's fixation will be through the direct synthesis of ammonia.

An Electric Railway Project.—It is stated that the Spanish Northern Railway Co. proposes to convert to electric traction the lines between Barcelona and Manresa, and Barcelona and San Juan de las Abadesas. Offers for the delivery of the material, including the rolling stock, and its erection, are to reach the Compania de los Camions de Hierro del Norte, Estacion del Norte, Madrid, by May 9th. Further information on the requirements and the conditions may be obtained from the electrification bureau of the company in Madrid.

A French Broadcasting Station.—One of the Continental broadcast radio-telephone transmitting stations which English listeners have become accustomed to hear in this country is that of L'Ecole Supérieure des Postes et des Télégraphes at Paris. It is known by its call signal FPTT, its nominal wavelength being 458 metres and power 500 watts; part of the transmitting apparatus is illustrated in one of the photographs here reproduced, whilst the other shows one of the aerial masts

Part of Transmitter, and Roof Aerial Mast, of L'Ecole Supérieure Broadcasting Station, Paris.

on the flat roof of the Central Telegraph Office building. The height of the mast may be gauged by comparison with the two men standing nearby and the arrangement of the aerial wires themselves will be noted with interest, differing as it does from that in use in this country. It is one of the three well-known Paris stations, and is housed in the training college itself, in the Rue de Grenelle. From small beginnings it has come to be one of the best known in Europe, and now transmits each evening from 8.30 p.m. Notwithstanding its small power its signals are received well within a radius of 1,200 miles, and are heard regularly over the whole of Western Europe from Sweden to Spain, as well as in Northern Africa.

Electric Dredges for Mining. — We learn that five electrically-operated mining dredges, to be used in the mining of platinum, are to be installed for the Platinum Trust of the Soviet Government of Russia for service in the territory of the Ural Mountains. They will be supplied from transmission systems at 40,000 and 10,000 V, 3 phase, 50 cycles, the working pressure being 440 V. The equipment is to be supplied by the G.E.C., America.

Electrical Association for Women.—On March 26th, a party of members of the Association paid a visit to the demonstration rooms and laboratories of Holophane, Ltd. Mr. L. M. Tye gave a short review of "Scientific Progress in Illuminating Engineering." Special colour demonstrations were made and films were exhibited showing shop window and interior lighting. Mr. L. Gaster, secretary of the Illuminating Engineering Society, and Mr. Loveday (E.D.A.), were with the party.

The first meeting of the Birmingham and Midland Branch of the Association was held at the Council House on March 29th. Professor Burstall, D.Sc., Dean of the Faculty of Science at Birmingham University, pleaded with humour and fervour for a forward movement amongst women towards electrical self-help in the home. He declared that he had himself "spring-cleaned" a room in twenty minutes—with an electric vacuum cleaner. Women should adapt their houses to their own strength, eliminate servants, and acquire good labour-saving devices, thus keeping their houses cleaner and giving themselves time to develop their own lives in other more congenial directions. It was essential that they should understand the assistance that electricity offered.

Mr. E. J. Jennings, secretary of the Electric Supply Department, reported an increase last year of 8,600 consumers in Birmingham, double the increase of the previous year and ten times the annual pre-war increase. He said there was a possibility of the power tariff in Birmingham being reduced to ¾d. (against the present 1¼d.).

Miss Haslett, Director of the Association, said that women must *clamour* for the help electricity could give them in their homes, but first they must understand what they were asking for. To teach this was the mission of the Association.

Cheap Electricity at Southport. — Mr. E. Moxon, A.M.I.E.E., borough electrical engineer to the Southport Corporation, informs us that during the two summer quarters the charge for electricity for heating is to be reduced from 1¼d. to 1d. per unit. The inclusive domestic tariff, made up of a fixed charge of 3s. per scheduled room per quarter, and a running charge of 1d. per unit for all electricity consumed, subject to a minimum charge equivalent to 2s. per scheduled room, has been adjusted by a reduction of the unit charge from 1d. to ¾d. per unit, the fixed and minimum charges remaining unchanged. A circular letter that has been sent out to all consumers points out that no one need have coal fires after April 1st, for six months, as electric radiators will give better, cleaner, and more efficient service, whilst cooking can be done in cool comfort, and hot water obtained with immersion heaters. These and many other electrical appliances can be obtained on hire or hire-purchase from the new Corporation showrooms, where demonstrations of electric cooking are given twice a week; the showrooms are kept open till 9.30 p.m. on those occasions. This, we believe, is an excellent way to develop domestic electricity supply.

Institution Notes.

Institution of Fuel Technology.—The first meeting of the Organising Committee of the above Institution was held on March 23rd, when the name of the Institution was definitely confirmed as above. Within the limits of its powers of co-option of additional members, the Committee is extending invitations to other organisations to be represented on it. A sub-committee was appointed to draft the constitution and by-laws. The draft will be considered in detail by the Organising Committee and eventually a copy will be sent in advance to everyone interested for consideration, prior to a second public meeting which will be called to adopt or amend the draft as the potential members may think fit. It is the intention that the new Institution shall be thoroughly representative of every branch of the wide subject of fuel. The support so far received has exceeded all expectations. All communications should be addressed to the Hon. Secretary (pro tem.), Mr. Edgar C. Evans, Caxton House (East), Tothill Street, Westminster, S.W.1.

Institute of Transport.—Circumstances have arisen which necessitate the postponement of the dinner of the Institute, which was to have been held on Wednesday, April 21st.

The I.M.E.A. Convention, 1926.—In the official preliminary programme of the Convention, abstracted in our last issue, it was stated that a paper on "Industrial Heating" would be read by Mr. A. P. M. Fleming. We now learn that this will be a joint paper, his collaborator being Mr. J. H. Crossley, Wh.Ex., B.Sc., industrial heating expert to the Metropolitan-Vickers Electrical Co., Ltd.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Halifax Corporation Tramways Committee received 33 applications for the post of tramways manager, vacated by Mr. B. Hall, who goes to Portsmouth. The list was reduced to five.

The appointment of Mr. F. E. Spencer, A.M.I.E.E., as Borough Electrical Engineer to the Birkenhead Corporation has been confirmed.

Mr. A. H. Darker, of Messrs. J. Stone & Co., Ltd., who is on a business tour of the world, has concluded his tour of India, Burma and Ceylon, and was, according to advice dated February 20th, on his way to Australia and New Zealand.

Dr. H. R. Wright, who succeeds the late Mr. Francis Hird as managing director of Siemens Brothers & Co., Ltd., was born in 1877. From early days his father, Mr. Henry S. Wright, of London, who was connected with chemical works in Manchester and Widnes, interested his son in scientific matters, encouraging him to make experiments in chemistry and physics. As evidence of the interest thus evoked, he thought out and himself constructed a coin feed apparatus when only about 10 years old. He commenced his scientific and engineering training at the Regent Street Polytechnic,

Dr. H. R. Wright.

London, under Professor H. Spooner, and continued at the Technical High Schools at Munich and Karlsruhe under Arnold, and at the University of Munich, where he took his doctor's degree at the early age of 21. Before returning to England, he acquired practical knowledge of Continental dynamo design at Vienna under the well-known Austrian designer, the late Professor Pichelmayer, and then obtained an appointment with Siemens Brothers & Co., Ltd., at Stafford. When the company decided to interest itself in the field of telephony and to extend its works at Woolwich, he joined, in October, 1907, the new organisation at the request of his former chief, Mr. F. Hird, at one time works manager of the Stafford works of Siemens Brothers Dynamo Works, Ltd., who had taken charge at Woolwich of this new work. During the 24 years of his service with the Siemens undertakings, he has been successively concerned with the activities of nearly every one of the departments, from designing large generator units to the introduction of mass production of small dry cells. During later years he was drawn more and more on to the administrative side, and in 1925 was appointed general manager to the company.

Mr. J. S. Peck, M.I.E.E., Fellow Amer.I.E.E., chief electrical engineer of the Metropolitan-Vickers Electrical Co., Ltd., sailed on April 2nd for New York, where he will attend, as one of the British representatives, the meetings of the International Electrotechnical Commission.

Mr. Alan A. Campbell Swinton, F.R.S., M.I.E.E., &c., is retiring from the electrical and general consulting engineering practice that he has carried on for the past 37 years at 66, Victoria Street, Westminster, S.W.1. He will continue special consulting work, also his electrical and engineering directorates and scientific activities, from his residence at 40, Chester Square, London, S.W.1.

There were 150 applications for the position of charge engineer to Mersey Power Company, and Mr. H. Pollard, Grad.I.E.E., of South Shore, has been appointed.

On March 31st, Mr. C. Furness, borough electrical engineer, Blackpool, was presented by the staff with a portrait of himself. The presentation was made by the Mayor at the annual meeting of the Electricity and Tramways Employés' Institute. Mr. Furness, in acknowledging the gift, gave interesting statistics respecting the great growth that had taken place in the electrical undertakings since his appointment in 1902.

Mr. H. J. Nisbett, for 12 years manager of the Torquay Tramways Co., who has retired, has been presented by the staff and employés with a book-case.

At a meeting of Accrington Corporation, recommended increases to heads of departments, including Mr. A. W. Clegg, electrical engineer, were negatived. The Electricity Committee recommended that the bonus of Mr. Clegg be increased from £166 to £214, which would have made his total remuneration £914 per annum.

Mr. A. Baxendale, who has terminated eight years as depôt superintendent for the Rawtenstall Tramways, and has been appointed rolling stock and works superintendent for the Wallasey Corporation, has been presented with a reading lamp and fountain pen by the staff and employés of Rawtenstall Tramways Department.

The Industrial Australian and Mining Standard states that Mr. R. W. Dalton, H.M. British Trade Commissioner in Australia, who is at present on a visit to New Zealand, will leave there early in April bound direct for London. During his absence, which is expected to be for 12 months, Mr. A. Simpson will act as senior Trade Commissioner. Mr. Simpson will remain in Sydney. The office in Melbourne will be in charge of Mr. F. W. Colman.

Obituary.—Mr. G. S. Corlett.—With further reference to the career of the late Mr. G. S. Corlett, the moment is appropriate for reminding our readers that he was one of the pioneers of the application of electricity to the coal-mining industry, and at a comparatively early date foresaw the great developments which have taken place in the mining electrical world. We understand that he was actually responsible for the installation of the first three-phase motor in any mine in this country. In March, 1923, Mr, Corlett had a serious breakdown in health, from which he never recovered. In spite of this handicap, he continued, almost up to the end of his life, to take a very keen interest in all that concerned the electrical world.

Mr. P. Dicks.—The death has taken place suddenly, at the age of 66 years, of Mr. Philip Dicks, head of the firm of Dicks, Ltd., electrical engineers, of Winchester. Mr. Dicks was a member of the committee of the Hampshire and District Branch of the Electrical Contractors' Association.

Herr A. Thyssen.—The death is reported of Herr August Thyssen, the celebrated German steel magnate, at the age of 85 years. He started with a very small capital, and in course of time amassed an immense fortune from industry, giving employment to 50,000 workmen. He continued business personally at his office right to the end.

Wills.—The late Mr. Leonard G. Tate, of the Electrical Contractors' Association, left £4,133 gross and £2,046 net personalty.

Sir Thomas D. G. Carmichael, Baron Carmichael of Skirling, a director of a number of companies, including the British Thomson-Houston Co., Ltd., and the Lanarkshire Tramways Co., Ltd., left £35,005 gross and £31,781 net personalty.

New Companies Registered.

City and General Radio Co., Ltd. (212,819).—Private company. Registered March 30th. Capital, £250 in £1 shares. Objects: To carry on the business of manufacturers of and dealers in wireless and electrical apparatus and goods, &c. The subscribers (each with one share) are:—C. L. Bradley, 48, Norland Square, Holland Park, W.11, radio engineer; T. H. Smith, 25, Addison Way, Golders Green, N.W.11, merchant. The subscribers are to appoint the first directors. Solicitors: Lloyd, Richardson and Co., 115, Shaftesbury Avenue, W.C. Registered office: 79, Cannon Street, E.C.

Essex Radio Supplies, Ltd. (212,892).—Private company. Registered March 31st. Capital, £1,500 in £1 shares. Objects: To carry on the business of engineers, advisers, experts, consultants and contractors in connection with wireless telephony or telegraphy, &c. The subscribers (each with 5 shares) are:—A. Reich, 65, Lordship Road, N.16, merchant; Raie Reich, 65, Lordship Road, N.16, clerk. A. Reich is permanent director. Qualification, £5 shares.

Quain Sunlight Lamps, Ltd. (212,795).—Private company. Registered March 29th. Capital, £5,000 in 3,500 8 per cent. preference and 1,500 ordinary shares of £1 each. Objects:—To acquire any interests in patents relating to medical, surgical, therapeutic, hygienic, or general appliances of any kind, particularly electric and other lamps of all kinds, for producing light and heat, &c. The subscribers (each with one ordinary share) are:—P. R. Pitts, 28, Merton Road, Walthamstow, E.17, solicitor's managing clerk; E. Brooks, Harrow Cottage, Knockholt, Kent, solicitor's managing clerk. The subscribers are to appoint the first directors. Qualification, 100 ordinary shares or stock. Solicitors: Roche, Son & Neale, 1, Church Court, Old Jewry, E.C.2. Registered office: 17, Victoria Street, Westminster, S.W.1.

Sign Construction Co., Ltd. (212,809).—Private company. Registered March 29th. Capital, £1,000 in 2s. shares. Objects: To carry on the business of electricians, manufacturers of, and dealers in electrical and other advertisement signs, indicators, and apparatus, to construct, lay down, and fix all necessary cables, wires, lines, accumulators, lamps, and works, &c. The directors are:—H. S. Coleman, 5, Winchester Street, Victoria, S.W.1, electrical engineer; C. E. H. Fitch, address not stated; S. H. Instone, address not stated.

Alton District Electricity Co., Ltd. (212,738).—Registered March 27th. Capital, £5,000 in £1 shares. Objects:—To carry on in the United Kingdom or elsewhere the business of an electric light and power company in all its branches. Minimum cash subscription, 500 shares. The first directors are:—K. A. S. Moncrieff, "The Clough," Oxted, engineer; E. H. F. Reeves, Field House, Friern Park, North Finchley, N.12, director of a public company; Sir Home Gordon, Bt., 44, Park Lane, W.; J. Eustace, "Elmhurst," London Road, Chelmsford, engineer; Lt.-Col. G. C. Stowell, "Glendale," Church Road, Hanwell, secretary of public companies. Qualification, £100. Remuneration as fixed by the company. Solicitors: Wilkinson, Bowen, Jackson & Curran, 34, Nicholas Lane, E.C.4. Registered office, 424, Salisbury House, London Wall, E.C.2.

Official Returns of Electrical Companies.

Scammell & Abbott, Ltd.—First mortgage debenture dated March 17th, 1926, to secure £200, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: E. W. Scammell, 20, Primrose Lane, Hall Green, Birmingham.

C. T. Briscoe & Son, Ltd. (173,926).—Capital, £5,000 in £1 shares. Return dated March 8th, 1926. 2,000 shares taken up. £110 paid. £1,890 considered as paid. Mortgages and charges, nil.

H. P. Electrical Co., Ltd. (187,715).—Capital, £1,000 in £1 shares. Return dated September 30th, 1925 (filed February 18th, 1926). 654 shares taken up. £654 paid. Mortgages and charges, nil.

Reflek Radio Co., Ltd.—F. Davies, of 245, Kingsland Road, E.2, was appointed receiver on March 18th, 1926, under powers contained in debentures dated December 22nd, 1925.

Flather & Co., Ltd. (74,602).—Capital, £20,000 in £1 shares. Return dated November 10th, 1925 (filed March 20th, 1926). 11,044 shares taken up. £9,544 paid. £1,500 considered as paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Marconi International Marine Communication Co., Ltd.

Mr. F. G. Kellaway (deputy chairman and managing director) presided at the annual meeting on March 31st, in the absence of the chairman, Senatore G. Marconi. In presenting the report, Mr. Kellaway said that the remarkable increase in the net profit—over £35,000—was due to the drastic administrative economies which had been effected and to the settlement of war-service claims against the Italian Government. The work of retrenchment was still proceeding and further reductions should be effected during 1926. The directors considered it unwise to pay too large a dividend and it was their intention to build up a substantial reserve for obsolescence and to carry forward a greatly increased amount. They intended to maintain their predominant position by keeping all their plant up to date. While the net profit had shown a substantial increase, it had not regained the level of some previous years; that was due to the continued depression in the shipping industry. Nearly 200 ships per annum had had to be dismantled with a consequent loss of business to the company. There had been a slight improvement, particularly on the Clyde, but it would be some time before the new tonnage would have its effect. They could therefore not look forward to any considerable expansion in new business during the current year, but they must look for the maintenance of their present favourable position and to a continuation of their retrenchment policy. The chairman then proceeded to review the accounts (*vide* Elec. Rev., March 26th, p. 509). Referring to the strike of wireless operators, Mr. Kellaway said that after three months the men had agreed to negotiate. It was hoped that the result would be to place the relations of the operators and the companies on a foundation of mutual confidence and respect. On the technical side, great improvements had taken place in the Marconi system of direction finding. An increasing number of shipowners were realising the value of the direction finder and many reports praising the instrument had been received. During 1925 the Marconi public-address system had been applied in ships to relay the music of ships' bands, &c. Mr. Ogle, the secretary of the company, had left to take up a position with Marconi's Wireless Telegraph Co., Ltd., and Mr. B. O. Collis, formerly assistant secretary, had taken his place. The report and accounts were adopted.

British Aluminium Co., Ltd.

The annual meeting was held on March 30th, Col. S. H. Pollen, C.M.G., presiding. In moving the adoption of the report, the chairman said that the net profit for the year had amounted to £550,434, as against £491,973 for the previous 12 months, and the trading profit was £517,105, as compared with £476,709, an increase of £40,396. The past year had been a favourable one for the company. They were fortunate in having an ample supply of water for the hydro-electric installations, and the output of metal from the works showed a record tonnage. Trading conditions continued to be satisfactory, and the demand for their products had, on the whole, been well maintained. Prices remained fairly steady and favourable. As the result of research work, continuously carried out by the staff, there had been improvement in methods of production, which had gone far to counterbalance the prices of raw materials and other charges incidental to production, which showed no indication of decrease. The development of non-corroding alloys had led to a marked increase in the use of aluminium in marine construction, and the textile industry was also adopting the metal more extensively. Among the newer uses, particular interest attached to aluminium alloy road wheels. The electrical industry year by year augmented its demands for aluminium for transmission lines, bus-bars, and other applications. The proposals of the Government for the more general distribution of electricity throughout the country should, if proceeded with, lead to a greater extension of overhead transmission lines, and they hoped that the aluminium industry would benefit from that development. The world's annual use of aluminium to-day in tonnage was approaching double the consumption of tin, and the world consumed in greater quantity only three other non-ferrous metals, namely, copper, lead and zinc. During the year they had added to the capacity of the alumina plant at Burntisland, and had found it necessary to further expand their rolling mills. Considerable extensions had been carried out at the works in Norway, in which they had a part interest, and the benefit from those would begin to accrue during the current year in the form of an increased supply of metal. Substantial progress had been made in the carrying out of the civil engineering portion of the Lochaber water-power scheme. The principal work to be undertaken was the driving of the main tunnel from Loch Treig to Fort William. That tunnel would be 16 ft. in diameter, and would have a total length of 15 miles. To enable this work to be tackled on a broad front and to be pushed with energy, it was necessary to carry out preliminary and temporary works of considerable magnitude, including the construction of a temporary hydro-electric station which involved the driving of a tunnel over a quarter of a mile long and the installation of plant of 4,500 h.p. capacity to provide power for the whole of the constructional work. Twenty-four miles of h.p. transmission lines had been erected, connecting up motor-driven air-compressing plants. Those various temporary works had been carried out by the contractors, Balfour, Beatty & Co., Ltd., with great expedition, and were now practically completed, and tunnelling operations were proceeding satisfactorily. It was a matter of great satisfaction to the directors to be able to submit accounts which exhibited still further improvement in the affairs of the company, and to be in a position to recommend, in addition to a dividend at the rate of 10 per cent. per annum, a bonus of 2½ per cent. As to the future, they would not expect him to prophesy, but he could say that up to the present no disturbing factor was evident. They could not expect all conditions to be always favourable, but they had no reason to anticipate that the results of the year now entered upon would prove otherwise than satisfactory. The report and accounts were adopted.

Llanelly and District Electric Supply Co., Ltd.

The annual meeting was held on March 30th. Mr. A. R. Holland, the chairman, in presenting the report, said that although the number of customers had increased during the year, the depression in the district had impeded the company's normal progress. The directors had adopted a progressive policy, laying a network of mains in districts which were expected to show future development. Given an improvement in conditions, there was little doubt that the company's business would show a substantial increase. Referring to the new Electricity Bill, Mr. Holland said that he did not think that the measure would encourage the development and use of electricity or cheapen the cost of generation and distribution. It was obvious that the provisions of the Bill would need considerable amendment before they could be held to deal fairly with the rights of private enterprise, which had done so much to further the development of the industry. There were indications of a slight improvement of trade in the company's area, but there were also considerable difficulties to be surmounted. The purchase of the property of the Gorseinon Electric Light Co., Ltd., had been completed; the undertaking would prove a satisfactory addition to the company's assets. The transport section of the business had been adversely affected by uncontrolled omnibus competition. Debenture stock and preference shares had been issued during the past year, and further capital was necessary to meet extra expenditure, including the connecting-up of a large colliery undertaking. The directors regretted that the ordinary dividend was lower, but they considered that they were adopting the best course.

British L. M. Ericsson Mfg. Co., Ltd.

The annual meeting was held on March 30th under the chairmanship of Mr. W. M. Crowe. In presenting the report, the Chairman mentioned that 1925 had been a record year for the company. There were definite signs of an improvement in industry and that the period of trade stagnation was passing. As indicating the amount of potential business which existed in this country, Mr. Crowe said that Great Britain was fourteenth in the list of the world's telephone users. There had been an enormous expansion in the United States and Canada, largely on the automatic system, and most progressive countries were developing along that line. At the Beeston works they had an efficiently managed automatic telephone department which would be capable of undertaking exchange work of almost any dimensions. The report and accounts were adopted, and at a subsequent extraordinary meeting an increase in the capital of the company to £500,000 was sanctioned. It is proposed to issue about 100,000 preference shares of £1 each for cash, and, later, to capitalise part of the reserve and issue ordinary shares to the present shareholders. It is also intended to raise the preference dividend from 6 to 7 per cent.

South London Electric Supply Corporation, Ltd.

Sir Harry Renwick, K.B.E., presided at the annual meeting on March 30th, and in the course of his speech, said that the results for the past year were satisfactory from every point of view. He quoted figures to show the progress which had been made since 1918 when the company commenced to take a partial bulk supply from the County of London Electric Supply Co. The dividend in 1918 was 5 per cent.; 15 per cent. had been paid for the last three years. He considered that those figures were eloquent. Referring to the reorganisation of supply in the

London area, Sir Harry said that the companies concerned hoped to be able to deal with the matter during the current year. In the meantime, the company was arranging to take a greater bulk supply from the County of London Co. They were of the opinion that they would not be affected by the Government's Electricity Bill, but the directors were watching the company's interests. The prospects for the current year were favourable, and the progress in new business was so far satisfactory. The report and accounts were adopted.

Electric Supply Corporation, Ltd.—The gross earnings for 1925 amounted to £101,024 and the sum taken into net revenue account to £46,971. After meeting charges, including the preference and interim ordinary dividends, there remains a surplus of £36,858. It is proposed to transfer £5,000 to general reserve, and £12,000 to depreciation, to write off balance of expenses of share issue, &c., £2,000, to write off £1,058, the cost of obtaining Orders for Hitchin and Exmouth, and to pay a final dividend of 6 per cent. on the ordinary shares (making 10 per cent. for the year), together with a bonus of 1 per cent. This will leave £6,300 to be carried forward. The amount of energy sold fell from 9,397,486 to 8,762,994 kWh. The report states that the Hendon Electric Supply Co. has paid a dividend of 15 per cent., but the Dumbarton Tramways Co. has again been unable to make any distribution. Meeting, April 15th.

Bath Electric Tramways, Ltd.—The annual meeting was held on March 31st. In the course of his speech the chairman (Mr. E. H. R. Trenow) said that the accounts showed a slight general improvement. The fare arrangement under which the company operated, somewhat heavily penalised it. In addition to the fact that while labour and materials cost about 100 per cent. more than in pre-war days and the fares were only about 40 per cent. higher, the company had to provide for renewals out of revenue each year. During 1925 nearly two miles of track had been overhauled and reconstructed and some of the loops had been extended. The number of passengers carried showed a satisfactory increase, but the average revenue was lower. So far this year the improvement was being maintained.

A. Reyrolle & Co., Ltd.—The profit for the past year was £70,621 and the addition of £19,206 brought forward gives an available balance of £89,827 (as compared with £82,709 in 1924). The directors recommend that a dividend of 12½ per cent. shall be paid on the ordinary shares (as in 1924), that £15,000 shall be transferred to reserve, and that £29,873 shall be carried forward. The capital expenditure during the year was £43,355, representing additions to offices, increased storage accommodation, and new machines. The recreation ground has been completed and a sum of £2,038 has been provided out of the year's profits. The work completed during the year was substantially larger than in 1924 and the exports of the company's manufactures continued to increase. The meeting is to be held to-day (Friday).

London Electric Wire Co. & Smiths, Ltd.—Sir George H. Fisher-Smith (chairman) presided at the annual meeting on March 31st, and in moving the adoption of the report and accounts, said that although the past year started with considerable promise there was a distinct slackening off during the course of the year. As a result the company's output had declined and the profit was £5,856 lower than in 1924. With regard to the current year the company was receiving a fair share of orders. If the legislative assistance promised to the electrical industry could be arranged to function quickly, good should result, but the maximum benefit would not be obtained unless individual effort was given full scope and unless there was complete co-operation between the interests concerned.

Lancashire Dynamo and Motor Co., Ltd.—After providing for debenture interest and depreciation, the available balance from 1925 is £20,201, to which is added £204 brought forward, making £20,405. The preference dividend has been paid and it is proposed to distribute 7½ per cent. on the ordinary shares, to transfer £5,000 to reserve and to carry forward £2,147. The report states that the results were again somewhat better than those of the preceding year, and the output was larger. The Company appears to be getting a good proportion of the orders which are being placed. The Crypto agreement has again worked satisfactorily in the interests of both companies.

Bournemouth and Poole Electricity Supply Co., Ltd.—The report for 1925 shows a balance on the revenue account of £153,407, to which is added £10,881 brought forward, making £164,288. After the payment of debenture interest, interim dividends, &c., and transferring £65,000 to general reserve, £25,000 to depreciation, &c., reserve, and £2,500 to staff superannuation reserve, there remains £40,192. It is proposed to pay a final dividend at 5½ per cent. on the ordinary shares (making 10 per cent. for the year), plus a bonus of 4 per cent., free of tax, leaving £10,076 to be carried forward. The capital expenditure during the year was £90,380. The amount of energy sold was 9,715,129 kWh. The meeting is to be held on April 15th.

Waste Heat and Gas Electrical Generating Stations, Ltd.—The annual meeting was held on March 26th, Mr. F. Stirling Newall presiding. In the course of his speech, the chairman said that the accounts were satisfactory. They had expended £1,719 on capital account, the balance of the capital expenditure on the provision of the extension to the Horden power station. That completed their capital commitments, as they had no additional proposals before them at the moment. Their investments had been increased by £10,424, which was invested in Government securities. The company was in a good financial position. The output from the stations was satisfactory, being more than 13 per cent. over the total output in the previous year. Two of the stations had not worked during the latter half of 1925, but in spite of that the aggregate output had gone up, mainly due to the operation of the Horden station extension.

Richmond (Surrey) Electric Light and Power Co., Ltd.—The profit for the past year was £36,239, and the addition of £1,823 brought forward gives an available balance of £38,062. After meeting debenture interest, &c., reserving £2,000 for staff superannuation and £7,250 for depreciation, &c., and transferring £7,000 to general reserve, there remains a balance of £5,763. Out of this the directors recommend the payment of a dividend of 10 per cent. on the old ordinary shares, leaving £2,630 to be carried forward. The amount of energy sold increased to 2,522,274 kWh. During the year an issue of 168,670 ordinary shares of £1 each was made. Meeting, April 15th.

Cork Electric Tramways and Lighting Co., Ltd.—The accounts for 1925 show an available sum of £22,881 (including £7,337 brought forward), after providing for debenture interest, &c., and transferring £4,500 to general reserve, and £15,000 to depreciation and renewals reserve. Interim dividends absorbed £9,613, and it is proposed to pay a final dividend of 3 per cent. (making 6 per cent. for the year) on the ordinary shares, and to carry forward £9,818. The receipts for the year were lower owing to the reduction of charges, a decrease in tramway traffic, &c. Meeting, April 15th.

River Plate Electricity Co., Ltd.—After meeting expenses, the profit for the past year is £47,292, and the addition of £12,169 brought forward makes £59,461. It is proposed to pay a dividend of 11 per cent. upon the ordinary shares (3 per cent. already paid) to transfer £14,701 to general reserve, and to carry forward £7,318. The directors also recommend that £34,701 of the general reserve shall be capitalised and allotted to the ordinary shareholders in the proportion of one to ten. The dividend for 1924 was 10 per cent. The meeting was to be held yesterday (Thursday).

Ransomes & Rapier, Ltd.—In their report for 1925 the directors state that although the results were satisfactory having regard to the state of the engineering industry, they consider that the future presents not a little anxiety. The amount available, including the balance brought forward, is £32,639. A dividend of 7 per cent., free of tax, is recommended on the ordinary shares (as against 12 per cent.), and a balance of £23,231 is carried forward.

South Wales Electrical Power Distribution Co., Ltd.—The balance on working for the past year was £96,762. After providing for debenture interest and depreciation, £7,073 remains. The dividend is to be paid on the 5 per cent. preference shares, and a balance of £807 is to be handed over to the South Wales Power Co. Meeting: April 16th.

South Wales Power Co.—The report for 1925 states that the administration of the undertaking was re-vested in the South Wales Electrical Power Distribution Co., whose report is dealt with above. The company's accounts show a net surplus of £18,441, after meeting debenture interest and preference dividends. It is proposed to put £10,000 to reserve and to carry forward £8,441. It is stated that apart from the adverse conditions prevailing in the area, some time must elapse before the expenditure upon extensions becomes more fully productive. Meeting: April 16th.

Italian Company.—*La Società Ligure Toscana d'Elettricità*, of Milan, reports that during 1925, the output of the company's stations reached a total of 171,094,400 kWh, as compared with 147,974,700 kWh in 1924. The net profit advanced from 10,956,308 to 14,013,131 lire, which enables a dividend of 10 per cent. to be paid. In order to provide for further extensions, the capital of the undertaking is being increased from 80 to 120 million lire.

German Company.—The *North German Cable Works Company*, Neukolln, proposes to carry forward the comparatively small net profit earned in 1925. The directors state that business in the current year has been very satisfactory and shows a considerable improvement over that in 1925.

Belgian Company.—The *Société des Constructions Electriques Belgique* (Liége) reports a net profit of 109,140 fr. for the last financial year, as compared with a loss of 761,303 fr. in 1924.

English Electric Co., Ltd.—The directors announce that, while the profit for 1925 is sufficient to permit of the payment of the full preference dividend, they are unable to recommend any dividend on the ordinary shares. Five per cent. was paid for each of the four preceding years, while in 1919 and 1920 eight per cent. was paid.

J. Stone & Co., Ltd.—The balance from 1925 (including £135,037 brought forward) is £296,115. It is proposed to transfer £130,000 to reserve, to pay a dividend of 2s. per ordinary share, and to carry forward £67,075.

Calcutta Electric Supply Corporation, Ltd.—It is stated in the financial Press that an offer of additional ordinary shares at a price providing a considerable bonus will shortly be made to the existing ordinary shareholders.

Stocks and Shares.

Tuesday Evening.

Holiday influences are very obvious in the Stock Exchange markets. Business became slack and uninteresting after the accumulation of post-orders had been dealt with on Tuesday morning. Prices are not greatly changed from those of a week ago. The principal alteration is a drop of 4s. 6d. in English Electrics, upon the wholly unexpected passing of the dividend.

It had been taken for granted that the English Electric would pay at least 5 per cent. for 1925, the same as in the four previous years. People are unable to account for the directors' decision, and they await, almost impatiently, the report and the meeting, for the unravelling of what is a genuine mystery in view of the impression that such companies as the English Electric had enjoyed a good year's trading.

The effect of this announcement caused sympathetic, if unnecessary, dulness in General Electrics, where the ordinary drooped to 30s. 9d. and the preference to 23s. The cable manufacturing shares are steady. Siemens at 32s. 6d. have gained 1/16. India Rubbers are sixpence lower. Both classes of Metropolitan-Vickers have gone ex dividend. As is usual at this time of year, a number of electricity prices are now ex dividend, and the present changes this week in our price-lists represent, in many cases, the deductions of the dividend amounts from the previous quotations.

It may be of service to observe, here, that when a price is officially quoted ex dividend in the Stock Exchange, the practice is to take off, as nearly as possible, the net amount per share paid by the company. In other words, the income-tax is duly taken into consideration. Where prices are regrettably wide, as they are, for example, in certain electricity issues, the deduction is of necessity approximate and not exact. Free acknowledgment may be made of the fact that official quotations are less misleading than they used to be, but there remains wide scope for further improvement in the way of narrowing the margins between the nominal purchase and sale prices, of which the middle figures, taken from the Stock Exchange official sources, are those given in our tables.

When prices are marked ex dividend, and there is no immediate recovery, the yields assume, of course, a more attractive aspect. As an example, Brompton ordinary may be cited, the return, on this week's price, being £6 3s. per cent., or about 5s. higher than that before the holiday. The critic will promptly, and correctly, maintain that this difference should be rectified, from the mathematical point of view, by making allowance for the accrued dividend in last week's price. To carry this into practice, however, and to calculate, every week, the increasing amount of dividend carried in every price, would not only entail doubling or trebling the work, but might lead seriously astray those who are interested in shares upon which the dividends fluctuate.

Apart from some half-score of ex dividend markings, the electricity supply share list is nearly unchanged. The market regarded with composure the second reading of the Electricity (Supply) Bill. It is assumed that the real modifications will come in the next stage upon which the Bill is about to enter.

The dramatic rises in Tube Railway stocks which occurred last week have been well maintained, and the glorious weather that prevailed throughout the holidays formed an added incentive to the previous cheerfulness. London Electric ordinary stock has strengthened to 49, showing a gain of 7 points in three weeks. Underground £10 shares are 5s. higher this week at 3¼.

Electric Supply Corporation shares are slightly harder at 33s. upon repetition of the 11 per cent. dividend. Gross earnings for 1925 were £101,024, or £360 below those of the previous twelvemonth. Midland Electric Corporation Power ordinary have risen to 53s. 9d. Bath Electric Tramways 5 per cent. preferred went back to 11s. 3d., in spite of the 1 per cent. increase in the dividend, which gives the shares 3½ per cent. The chairman, at the meeting last week, spoke hopefully of the company's outlook: he mentioned trade conditions and the weather as being two important factors which are beyond the board's control. The Cork Electric Tramways took less and spent less, last year, the upshot being the maintenance of a 6 per cent. dividend on the ordinary shares, and an increase in the carry forward.

Cromptons have gone back to 15s., and the preference to 17s. British Electric Transformer 7 per cent. preference at 19s. 6d. are about 9d. higher on balance.

Anglo-Argentine Tramways continue depressed for the reasons set out in our notes a week ago. Brazilian Tractions, after being 89, rallied to 90½. British Columbia preferred is better and a slightly better tendency is manifest in Mexican Utility issues.

Cable stocks and shares have few variations in their group. Marconis maintain their advance at 23s. 9d. The company announces inauguration of a wireless service to Moscow. Mr. Marconi has recently undergone an operation from which he is recovering rapidly, Mr. Kellaway stated at the meeting of the Marconi International Marine Company. Shipping showed a little improvement in 1925, said that chairman, but the depression had shifted to the shipbuilding industry. "Since 1921," he observed, "British shipping has passed through one of the worst periods in its history."

Engineering shares are not affected, so far, by the recommendations of the Coal Commission. Babcocks keep close to 53s. 9d. Rubber shares show but trifling signs of activity. The Stock Exchange view is that most markets are likely to move upon humdrum lines until people know what is going to be disclosed by the Budget.

India's Electrical Imports.

Principal Sources of Supply.

FULL details of India's import trade in 1924-25 in electrical goods, showing the principal countries of supply, have recently been issued. From these the following particulars have been extracted. The corresponding figures for 1923-24 have been added for purposes of comparison and a note of increases or decreases given.

	1923-24. Rs.	1924-25. Rs.	Inc. or dec. Rs.

Export Credits Insurance.—The report is to be issued immediately of the Committee appointed last July by Mr. A. M. Samuel, Parliamentary Secretary of the Department of Overseas Trade, to consider the question of insurance against bad debts in export trade. The task of the Committee was to see whether it was possible to devise a scheme for the issue of policies for the insurance of bills which may be drawn for British goods sent into foreign countries, where there may be risk of default owing to war or political trouble, in addition to the ordinary risks of commercial credit. It is understood that the Committee has found it possible to devise a scheme, which, it is believed, answers the necessary requirements. As the Committee comprised representatives of the banks, accepting houses, insurance companies, Lloyd's, the Association of British Chambers of Commerce, and the Federation of British Industries, together with the Comptroller-General of the Department of Overseas Trade, there is every hope that the scheme will find general acceptance.—*The Times.*

High-Power Fusible Cut-Outs.

Some Factors which Influence their Rupturing Capacity, and Research Developments.

By L. C. GRANT, A.M.I.E.E.

(*Abstract of Paper read before the* Institution of Electrical Engineers.)

(*Concluded from page 560.*)

Iron-clad Oil-immersed Cut-outs.—Appropriate samples have been tested on short-circuit up to 6,600 volts with satisfactory results, but no tests have been carried out by the author on the higher-voltage patterns. Fuse length and current density are together responsible for the energy loss and consequent heating of the oil. A satisfactory fixed break was evolved for low-pressure work, but for high pressure springs were added to ensure a rapid and long break, and, finally, the contacts were so arranged that in breaking a 50,000-kVA short-circuit

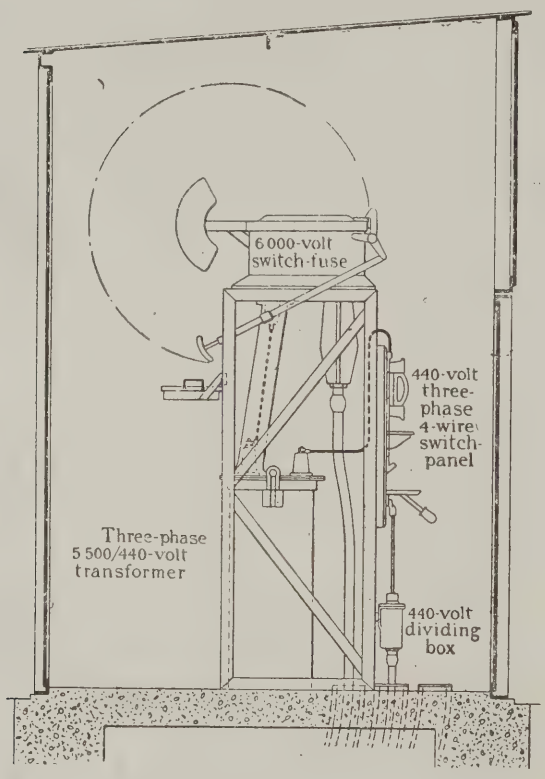

Fig. 5.—Oil-immersed 6,600-V Fuse Installation.

at voltages up to 6,600 V, the distance between the contacts is about four times the maximum arcing distance. In reducing the fuse length, a limit is reached when the end connections exert an appreciable effect on the cooling of the fuse wire. A length of 1½ in. was finally adopted as a workable value; a certain amount of cooling is exercised by the contacts on a fuse wire of this length, but it is consistent, and accurate calibration is possible.

Extinguishing the arc within the first half-cycle, which has been shown by test to reduce the shock to plant, mains, &c.,

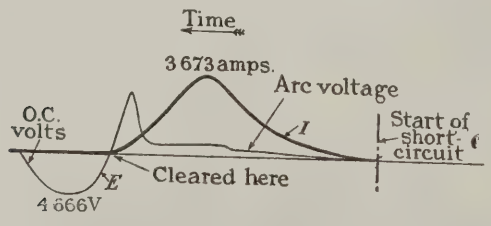

Fig. 6.—Short-circuit Test on Stabilised Arc Fuse at 5,000-V.

to a remarkable extent, necessitated a speed of 30 ft. per second, and the spring was finally arranged for 40 ft. per second. This gives the maximum speed of break without introducing the risk of pressure-rises through enforced decay of the current, an important point. It is of the utmost importance that the speed of break should not be too high, or else the arc will be lengthened too rapidly, a condition analogous to introducing resistance into the circuit.

After oil fuses of this pattern had been in service for some time, the fusible elements gradually became covered with a brown deposit and the metallic portion appeared to be reduced in section cumulatively, until finally the element would melt on reduced current, or even spontaneously. This appeared to be a recrudescence in a new form of the old oxidation trouble experienced with air cut-outs, and in oil was experienced with any ratio of fusing current to load current lower than 3 to 1. In order to avoid this trouble, while retaining a reasonable fusing factor, bi-metallic fusible elements having a copper core sheathed with tin or tin-lead were finally adopted.

In short-circuit tests at 6,000 volts, when breaking 10,000 kVA, the sustained pressures in oil tanks averaged 20 lb. per sq. in. At 20,000 kVA the average of a number of tests was 35 lb. per sq. in., and at 60,000 kVA the pressures reached 150 lb. per sq. in. several times, but averaged more nearly 80 lb. per sq. in.

Oil-immersed fusible cut-outs are suitable for controlling power-station auxiliary motors, for large power industrial work, for networks, &c. They are rated at voltages up to 660 between phases and, with modifications, for 3,000-volt industrial work as an alternative to the high-pressure (proper) oil fuse. It has been found necessary, as with the high-pressure fuses, to use bi-metallic elements. The fuses are not held by any tensioning arrangement, but are retained between fixed contact blocks of considerable mass to reduce heating and the effects of arcing. They withstand the full starting current for 2 seconds without blowing, but should clear a sustained stalling current.

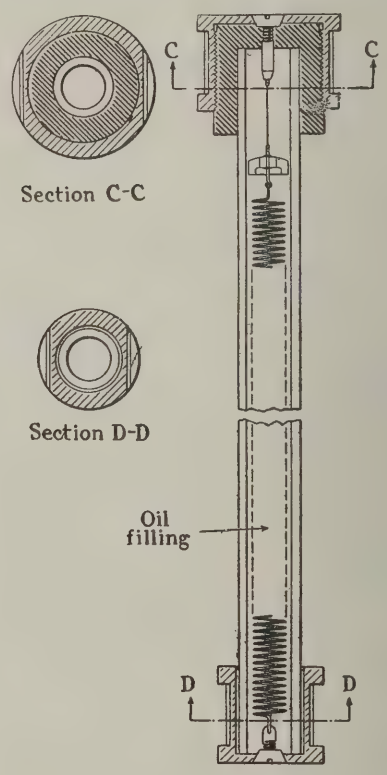

Fig. 7.—Section of Resistance Fuse.

The oil-fuse has been proved capable of breaking load current and isolating a high-pressure circuit by simply swinging back the lid without affecting the fusible elements; it is possible to close it on full load and moderate short-circuits with safety. Fig. 5 shows a typical 6,600-volt oil-immersed fuse installation. A new form of cut-out has its fusible element oil-immersed and the arc characteristic can be consistently reproduced, fig. 6; the arc voltage is quite stable, there being none of the vicious harmonics usually found in an arc characteristic. The process of rupture, as shown in the oscillogram, is clean and rapid and the performance quite different from anything previously experienced. In the test illustrated, the fuse cleared a short-circuit power of 3,673 amperes at 4,666 volts without any visible or audible evidence of its having operated at all. The overall dimensions of the fuse are comparable with many of the old forms of cartridge fuse in common use, which in the test described in this paper proved to be inadequate.

Limiting Resistance.—The majority of the better designs of tubular fuses can be made to function quietly with a series resistance which limits the short-circuit power. Upon reducing the value of the limiting resistance, two things happened: Failure of the fuses commenced and it was found difficult to produce a resistance which could safely be put forward for enclosure in switchgear structures. It was therefore reasoned that the resistance and fuse could well be enclosed in a single container, thus obtaining a dual advantage. A short spring-

controlled fuse was immersed in oil in a tubular container as shown in fig. 7. The resistance wire was made in the form of a spiral to obtain the requisite resistance and to take advantage of the magnetic effect of the turns of the spiral in obtaining a rapid break, and finally resulted in a workable arrangement which could be connected directly across a high-pressure circuit and which interrupted the resultant power without noise, flash, or other unwanted phenomena.

Particulars of a series of tests on ordinary fuses suitable for potential transformers and small power supplies at high pressures are given in the paper. The fuses, rated for 3,000 to 11,000 volts, were of various forms and fillings were employed in a great many. It appears to be the rule that unless such light fuses can be designed to break early in the first half-cycle, they will immediately be destroyed and a dangerous arc across the main contacts be set up. It is not sufficient to ensure that the circuit is cleared in half a cycle, as the current may rise to a maximum in such circumstances. The limiting effect which is so essential is secured only if the fuse is melted on the initial rising current curve.

Conclusions.—It is considered that all cut-outs should be capable of clearing the maximum short-circuit power without any explosive effect, and the investigations have proved that there are now available :—

(*a*) Fuses capable of handling short-circuit powers up to 70,000-100,000 kVA at a maximum voltage of 600.
(*b*) High-voltage tubular fuses capable of interrupting up to 40,000 kVA.
(*c*) A further class of high-voltage fuses capable of interrupting several hundred thousand kVA.
(*d*) Resistance-fuses suitable for any small work, such as the control of small services, potential transformers, and other and more unusual offices, such as the control of wired-wireless equipment.

Truck-Type Switchgear.

A Ferguson, Pailin Composite Installation.

Truck-type switchgear is deservedly popular. Only recently, however, has its suitability for duty involving high rupturing capacity been realised. In the case of an installation manufactured by Messrs. Ferguson, Pailin, Ltd., for a Canadian hydro-electric scheme, the gear is of the composite pattern, the busbars, current transformers, &c., being mounted in a stonework cell structure, the circuit breaker only being of the draw-out truck type.

A general view of one of the switch trucks is shown in fig. 1, the rear view of the same truck being given in fig. 2. The flanged wheels are mounted on roller bearings and grooved rails ensure correct registration; a skeleton framework for receiving the truck portion is accommodated in the circuit-breaker compartment of the cell structure. To facilitate plugging home and withdrawal, truck pinions are fitted which engage with two racks on the stationary framework, and are operated through bevel gearing by a detachable handle at the front of the truck. Interlocks make it impossible to insert this handle until the circuit breaker is off, or to close the circuit breaker until the handle is removed.

Due to the heavy currents involved, it was found impracticable to use the standard cylindrical isolating plug and socket arrangement. Consequently a V-bar and finger type of contact was specially designed so as to have full self-aligning features. The supporting insulators are capable of withstanding large cantilever forces; fig. 3 illustrates the type used, and it will be noticed that the plug insulators are provided with long back connections suitable for passing through the cell walls into the other compartments of the structure. The shortness and rigidity of the connections between the circuit breaker terminals and the isolating sockets should also be noted.

Each truck unit is equipped with a type PA triple-pole oil circuit-breaker rated at 1,200 amps. at 15,000 volts, a common top plate being provided for all three phases, heavily ribbed and giving a large air space above the oil level. A baffled vent is fitted on each phase and is provided with a gas separator which returns ejected oil to the tank when the pressure has subsided. The tanks are elliptical in shape, supported from the top-plate by a steel cradle and down-rods, a rope gasket preventing oil throwing. The rope and pulley tank-lowering mechanism is operated by the same detachable handle as is used for racking the unit in and out, and it is impossible to insert the handle until the truck is withdrawn.

The glazed porcelain insulators are cemented into clamping rings which are bolted to the top plate, thus facilitating renewals. The switch contacts are of the standard Ferguson-Pailin finger and inverted V-bar type, the apex of the V being truncated to allow the opening motion to squirt fresh oil on to the contacts; arcing contacts of large capacity are fitted.

Electrical operation by means of d.c. solenoids is used throughout. The mechanism is energised by a single-pole contactor, both contactor and solenoid being mounted on the front sheet of the truck. The operating and tripping supply is brought in by means of auxiliary finger contacts on the truck which make contact with auxiliary bars on the side of the stationary framework; they are clearly seen in the illustrations. The auxiliary bars are of such a length that the truck can be withdrawn a safe distance for isolation without interrupting the auxiliary supplies, thus enabling the circuit breaker to be tested, but interlocks prevent the operation of the breaker if insufficiently isolated.

Canadian Water Power Dispute.—The *Daily Telegraph* states, with regard to the debate in the Dominion Parliament in favour of drastic action through the British Government to enforce Treaty engagements entered into by the United States concerning water rights in the Great Lakes, that the whole question has become more acute of late years, owing to the reduced level of the water in the canals and the resulting bad effects on important water-power developments, not only in Canada, but also the United States. There has been continual agitation on the part of Canada, and also of the Eastern American States, to have these defects rectified. The difficulties are rendered more acute by the increasing water demands of Chicago simultaneously with similar demands of Canada and the United States for water for navigation and power purposes. The Canadian point of view for the moment is that the legal rights of the Dominion shall be backed up by the British Government and the British Ambassador at Washington, in order that Chicago may be forbidden to break the existing Treaty, which, in effect, limits the amount of water to be used either by Canada or the United States. Canada now realises that the time has arrived for the United States to take the necessary measures to prevent the increasing diversion of water. Any representations on the subject would be made through the Governor-General of Canada, the Dominions Officer in London, and the British Ambassador in Washington.

The Propagation of Radio Waves.

Some Results of the Radio Research Board's Investigations.

By J. HOLLINGWORTH, M.A., B.Sc., A.M.I.E.E.

(*Abstract of paper read before the* Wireless Section *of the* Institution of Electrical Engineers.)

The paper outlines the results obtained from a systematic study, by the National Physical Laboratory on behalf of the Radio Research Board under the Department of Scientific and Industrial Research, of the received intensities of various long-wave transmitting stations at four receiving stations over a period of nearly two years. The weekly averages of the results are studied, and it is shown that they are inconsistent with any law of stead decay. The results also show very marked periodic variations.

Seasonal Intensity.—The most striking feature of the observations (over the period June, 1924, to December, 1925) is the fact that in the early months one station recorded signals equal to, and even greater than, those at another, although the distance were 695 km. and 485 km. Also on the few individual days when variations did occur, they usually appeared at all stations, but not necessarily in the same direction. An unusually high value at one station was generally accompanied by a low value elsewhere.

During September, 1924, although the change in weekly averages was mostly small, day-to-day variations became much larger; and at the same time it was noticed that the bearings were becoming unsteady and the minima poor. In October, however, big changes began to occur, culminating in sudden and enormous variations in the week October 25th to November 1st. The first, and most striking, characteristic was the simultaneity of the changes. In these few days signals from stations far apart at receivers far apart, showed abrupt changes, amounting in some cases to over 100 per cent. The effects were not merely transient, as in most cases, although the day-to-day unsteadiness was very marked, there was in the following weeks no definite reversion to the summer values.

It is hardly possible to avoid the conclusion that these changes were not due to local variations, but to some main cause operative over a large area, and the possibility is also suggested that all signal-strength variations might be due to this cause, differing in degree rather than in kind. Also, in view of the fact that signals were practically equal when their path was entirely over land and entirely over sea, it does not seem possible to admit the conductivity of the ground as a major controlling factor.

Intensity/Distance Distribution.—Space-distribution curves (*i.e.*, intensity plotted against distance and not against time) obtained by means of a portable measuring set on four tours, one extending to Aberdeen, are entirely free from anything in the nature of a steady decay, and seem to justify very definitely the claim for the existence of an interference phenomenon.

General Inferences.—An interference phenomenon demands two waves. The velocity of propagation of a "surface" wave over a semi-conductive layer is slightly different from that of a "free" wave in space. At first sight, this suggests a possible explanation of the phase-changes necessary to produce an interference effect, but calculation shows that by the time a sufficient phase-change had occurred due to this cause, the "surface" wave would have been attenuated to a negligible intensity. Therefore, the explanation must be found rather in difference of path length than in velocity of propagation, and this leads at once to the idea of the upper layer, which forms the basis of most of the methematical work on the subject, but it has been claimed that all observed phenomena can be accounted for without its assistance. Assuming the existence of such a layer, but with its characteristics unspecified, all the results obtained in the paper can be accounted for if certain definite constants are attributed to it. At this stage of the work it is impossible to give a decision as to the actual physical nature of the layer, its constitution, or its sharpness of definition. Consequently, it cannot be said definitely whether the effect is strictly one of refraction or reflection, or, as seems likely, of an intermediate nature. In all that follows the word "refraction" is used in this indeterminate sense and must not be more strictly interpreted.

The distances at which maxima and minima should occur for various heights of layer have been calculated and plotted. With regard to these curves, it is very important to note that the actual positions of the maxima and minima are independent of the attenuation of either of the waves, a fact which is of great value, as it eliminates some of the most uncertain of the unknown factors. The actual intensities at these points are, however, entirely dependent on the attenuations, so that the interference phenomena will exhibit all degrees of intensity. At short distances, where the surface wave is strong and the refracted wave weak, due to the small angle of incidence, the maxima and minima will follow in rapid succession as the distance varies; but their actual excursions will probably be so small as not to be definitely separable from the irregular momentary and daily variations. As the distance from the transmitter increases, the effects will become more and more marked, and an almost total extinction may be obtained; whilst at greater distances, due to the large attenuation of the surface wave, the effect will again diminish, if by this time it has not totally disappeared, as the last minimum will be at the point at which the two paths differ by half a wave-length.

It thus appears that, at any rate up to this date, all the major elaborate variations observed are explicable on the assumption of a refracting layer at a height of about 75 km. during the summer months, rising somewhat abruptly during October to a height of about 90 km.

This does not, of course, definitely prove the existence of such a layer, and all that can be said at present is that it offers what appears to be the simplest explanation, which, at the same time, covers all the most marked observed phenomena.

Seasonal Variations.—The abrupt transition at the end of October appears to mark a distinct line between summer and winter, and it seems impossible that the winter change is merely a reversion to normal night conditions. The two may be related, and probably are, but they do not seem to be identical.

For the daylight stations the results appear to group themselves into two sections, that from May to September being marked by its relative stability, and that from October to May both by average values differing largely from the summer ones, and also by a very pronounced day-to-day instability. Also, it has been shown that the marked change at the end of October is consistent with a rise in height of the layer from 75 to 90 km., so that it seems natural to suggest that some, at any rate, of the winter variations are due to the same cause.

One point in connection with the layer appears to be very striking. A change in height of only about 10 km. may be sufficient to convert the signal at a given point from a maximum to a minimum; now the readings during the summer show that the day-to-day variations at any given point are often only a few per cent., and that even the weekly average for the same week in successive years may not differ by more than this amount. Consequently, although it appears that the layer undergoes a nightly change, it must go through a cyclic change of extraordinary constancy over periods measured by weeks, if not by months.

Sunset Effects.—Summer intensity went through a very marked cycle of change, which was repeated daily with only very minor modifications. Whilst the same thing was true at every station, the actual curves obtained had entirely distinctive and different shapes. The effect can no longer be classed under the general heading of "night increase," but must be, although perfectly systematic, of a much more complex nature. Now it is generally held by the supporters of an upper-layer theory that, with the removal of sunlight, the effective height of the layer increases. Following out this idea, the variations at all stations are explicable on the basis of a rise in effective height from 75 km. to 90 km., bearing in mind the fact that a minimum is not necessarily a zero.

Another interesting, though tentative, calculation can be made from these results; it is possible to determine the actual values of the maximum or minimum attained at each station, and sometimes both, depending on the range of the curves. The intensity of the diffracted wave can also be calculated from the formula given by Watson and by Van der Pol, and hence the intensity of the reflected wave is known. From this the equivalent reflecting power of the layer can be deduced, on the assumption that the intervening air is a perfect dielectric.

These results are interesting, especially as showing the rapid falling off of reflecting power for larger angles of incidence, which is not altogether unexpected, but like many other figures in the paper they must be subject to further verification.

Conclusions.—Whilst many of the ideas suggested cannot at present be regarded as much more than guesses at a possible state of affairs, it may be as well to state some of the definite facts that rest on experimental evidence.

(1) Long-wave signal intensities over medium distances ($< 1{,}200$ km) remain extremely steady over the period May to September, during daylight hours.

(2) Their distribution does not correspond to the Austin-Cohen formula for anything less than yearly averages, in which case the distance is not large, and the law of decay is not uniform.

(3) During the sunset period each station goes through a distinct and individual cycle of change, which is repeated daily.

(4) Towards the end of October all observed stations showed simultaneous and large departures from their summer values; this is the beginning of a period of marked day-to-day instability, which persists until the following May, by which time all stations have settled down to their normal summer values.

(5) Careful plotting of a day-time intensity distance graph gave an undulating curve, showing, under certain conditions, practical extinction at a definite distance.

(6) In addition to the slow periodic changes, there appear to be more rapid fluctuations superimposed; during the summer months they are comparatively small, but assume big intensities during the winter; there is not yet evidence to decide whether these are due to fluctuations of layer height too small and rapid to be definitely detected by present methods, or whether they are due to some totally separate cause.

The actual results in this paper are definitely confined to medium distances and long waves:

(*a*) *Long distances.*—The interference phenomena discussed above have a definite upper limit of distance for two reasons: The first is that, on the assumption that they are caused between a refracted and a diffracted wave, the attenuation of the latter is so large that at great distances its effect is negligible. Secondly, the effects cease when the difference in path length for the two waves becomes less than half a wave-length; and this, together with the curvature of the earth, places a definite geometrical limit on the possible distance, there being also a maximum range for a first reflection with a given height of layer. The idea of multiple reflection cannot, however, be excluded, and it is conceivable that the signal from a distant station would consist of the vector sum of a series of multiple reflections.

(*b*) *Short waves.*—There is danger in applying these results directly to wave-lengths below 1,000 metres, for, whilst the presence of such a suggested upper laver would be a very important factor in short-wave propagation, the difference in frequency is so great that there is no doubt but that the actual observed phenomena would be entirely different.

Northern Telephone Development.

Progress Achieved on the North-East Coast during 1925.

THE continued depression in the staple industries of the North-East Coast has not been without its effect on the telephone service, but this is reflected more in the number of calls made than in the number of orders obtained for new telephones, and substantial progress was made in 1925 in the number of telephones in use. These facts are made apparent by the annual reports of the Chamber of Commerce Telegraph and Telephone Advisory Committees for the Newcastle-on-Tyne and Middlesbrough areas, of which copies (abstracted below) have been sent us by Mr. J. R. M. Elliott, M.I.E.E., superintending engineer, Northern District, Post Office Engineering Department.

Newcastle-on-Tyne Area.

In the Newcastle district at the end of December, 1925, there were 29,813 telephone stations, a net increase of 75 per cent. since January 1st, 1912, the rate of increase comparing favourably with the pre-war increase. The retrograde effect of the war has been overtaken, and since the war development has been well maintained.

The total number of stations (29,813) includes 28,517 subscribers' exchange telephones, the remainder representing call office, service, and private wire stations. The total number of private householders renting circuits at the reduced residence rates was 3,441, a percentage of over 12. Exchanges numbered 113; call office station 446; street telephone kiosks 37; new exchanges opened under the rural development scheme of 1922, 18; and rural party line stations 94; while one rural railway station was connected with an exchange system. During the period January to December, 1925, the increase in the system, inclusive of 1,789 transferred from the Middlesbrough district in August, amounted to 3,280, the net figure being 1,491 stations. Agreements for the erection of street kiosks have been completed with seven municipal corporations and with three urban district councils, and 21 public call offices were opened at small post offices where telephone facilities did not exist previously.

The exchange at Whitley Bay was removed to a new building and a modern common-battery exchange to afford accommodation for 800 subscribers' lines installed; this work involved the replacement of all the old subscribers' telephones. Three other exchanges were removed to more commodious premises and (as well as at four other centres) new equipment of the common-battery signalling type installed. Switchboard extensions have also been made at 18 places, while extensions are now in progress at 10 exchanges and three new rural exchanges were established.

Trunk and junction lines joined up numbered 88 and over 27,500,000 effective originating local and junction fee calls were made, whilst the number of trunk calls was in excess of 2,300,000. Telegrams received by telephone from the public exceeded 310,000. The minimum deposit required from subscribers in respect of trunk and local call fees was reduced by 10s. as from July 1st, 1925, affecting 8,600 subscribers whose average quarterly use did not exceed 30s.

Particular attention is paid to the telephone possibilities of undeveloped areas and those in which building reconstruction is likely to take place; the whole of the larger exchange areas in this district have been covered and the studies made during 1925 included 17 areas, following which comprehensive systems of underground plant in 20 places have been carried through to completion during the present year, while 16 local underground schemes are in active progress and further works of this nature will shortly be commenced. In large buildings containing several suites of offices it is now the practice to make a development study and then cables containing a sufficient number of wires to meet all probable requirements are led into the building and distributed from the basement within the building. Six buildings in Newcastle-upon-Tyne have received attention in this way.

Intertown and long-distance service cables which have been completed in the Northern Engineering District during the current year and are now being gradually brought into use number 12, in addition to others at present being provided. The Newcastle-Catterick cable will provide underground telephone communication throughout between Newcastle, Leeds, Hull, Manchester, Liverpool, Sheffield, London, and other towns; the Newcastle-Catcleugh cable will provide underground communication from Newcastle to Edinburgh and Glasgow, and both cables will be used for communication between Scotland and the South, East, and West of England.

It is not usually appreciated that an open wire telephone circuit possesses inherently a much higher transmission value than a circuit of similar gauge contained within a cable, but conversation over long distances by means of cable circuits has become possible with the aid of Pupin loading coils and the thermionic telephone repeaters. The former are fitted at distances of approximately 2,000 yards apart and repeater stations at 50 mile intervals; two of the latter have lately been completed in the Northern Engineering District at Catterick (Yorks.) and Kenton (near Newcastle), and it is expected that both will be brought into use during the early part of 1926. As a temporary measure, however, a provisional repeater station has been installed in Newcastle, through which certain long-distance underground circuits are at present working.

The conversion from manual to automatic working of the telephone system within a radius of five miles of Newçastle has been decided upon, and building operations have been commenced. The three automatic private branch exchanges that have been installed are giving every satisfaction.

The total mileage of underground main lines (trunk and telegraph) increased from 12,545 to 40,819 in 1925, while the total underground local (subscribers') line mileage increased from 46,925 to 55,816, the grand total being 96,635 miles.

Middlesbrough District.

In this area development proved to be fairly satisfactory under the very adverse trade conditions prevailing; the depression in the iron, steel, and shipbuilding trades particularly was to a great extent responsible for the cessation of many telephones, the number on December 31st, 1925, being 10,514, as against 11,603 at the end of December, 1924, but on August 1st last, 1,789 telephones were transferred to the control of the Newcastle Telephone District, and the net increase during the year for the Middlesbrough District was therefore 700 telephones.

Two new rural exchanges were opened and one was removed to more commodious premises and exchange equipment of increased capacity installed. Extensions of exchange equipment have been carried out in nine cases and two others are in progress.

At Hartlepool and West Hartlepool new automatic exchanges are in course of construction, and the opportunity is also being taken to considerably augment the underground plant; it is anticipated that the change over will take place in July. Automatic working has been decided upon for Middlesbrough, South Bank, Linthorpe, and Stockton-on-Tees, and building operations of an extensive character are already in progress. The installation of modern common-battery equipment at two exchanges has been decided upon.

There has been a large increase in the number of call offices during the past two years, which development has been accelerated by the provision of kiosks in public places; twenty are now working in the district, one is in course of erection, and negotiations are in progress for four more. The total number of call offices at end of 1925 was 229.

In the Middlesbrough District, following development studies, comprehensive underground systems have been carried to completion in six places and at present local underground schemes are in active progress at 11 places. The effective trunk calls actually brought to account during the quarter ended December 31st last reached 278,620. Telegrams received by telephone from the public exceeded 40,400, whilst the local effective calls handled and charged for were slightly in excess of 159,000.

The total mileage of main underground lines (trunk and telegraph) increased during the year from 5,925 to 18,458, and that of the local (subscribers') lines from 12,984 to 14,605, the grand total being 33,063 miles.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A Direct-Reading Portable Wheatstone Bridge.

A recent production of the India Rubber, Gutta Percha and Telegraph Works Co., Ltd., Silvertown, London, E.16, takes the form of an instrument of the above description, fig. 1, which has been designed to fulfil the demand for a cheap and reliable design of portable Wheatstone bridge for the rapid measurement of conductor resistances. The apparatus is self-contained, and rotary switches for varying the adjustable-arm resistance are mounted on the under side of the panel. The resistance values are indicated through circular openings in the switch covers and the ratio arm can be set to read directly or in multiples of 10. The instrument is fitted with a moving-coil galvanometer of suitable sensitivity, and battery and galvanometer keys are provided, the battery of dry cells being fitted into a compartment in the bottom of the teak case. The apparatus is claimed to be suitable for hard usage and always ready for immediate use.

The switches are provided with rubbing contacts of ample proportions, thereby ensuring clean contacts of negligible resistance. There are only two connections to make when using the instrument, the resistance terminals, and technical knowledge of the Wheatstone Bridge is not necessary on the part of the operator.

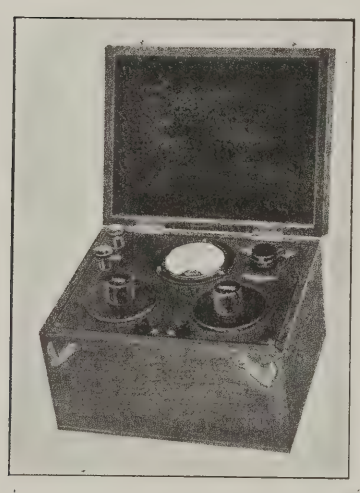

Fig. 1.—Portable Wheatstone Bridge.

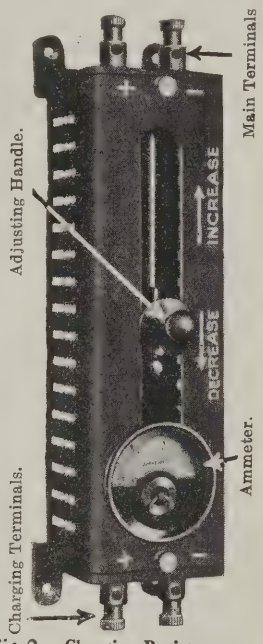

Fig. 2.—Charging Resistance.

A New Charging Resistance.

In order to meet the demand for a simple and cheap apparatus which will enable h.p. wireless accumulators of small capacity to be charged from the supply mains, the General Electric Co., Ltd., Magnet House, Kingsway, W.C.2, has introduced a d.c. charging resistance, fig. 2. The unit consists of a slate former, wound with resistance wire of ample rating and low-temperature rise, the complete winding being treated with heat-resisting cement. The current regulator consists of a self-aligning brush, which slides over the turns of wire, and the regulation obtained is claimed to be suitable for controlling the charging of a 60, 100, or 150-volt accumulator at 150 milliamperes, from a 110 or 220-volt d.c. supply. The complete apparatus is self-contained with a dead-beat ammeter and incoming and outgoing terminals, mounted between two cast-iron end pieces with a sheet-metal cover, finished black.

An Improved Electric Iron.

The Coventry Electrical Accessories, Ltd., Conduit Yard, Fleet Street, Coventry, has recently marketed an electric iron, Patent Point, fig. 4, in which is incorporated a special device for heating the nose of the iron. A piece of material of high heat conductivity is introduced into the base of the iron at the nose, and it is claimed that this attracts the heat to that part of the apparatus, resulting in a constant temperature there. It is claimed that the introduction in this iron of the heat-conductivity piece renders it only necessary to have the iron on circuit for about three minutes for a half to three-quarters of an hour's working, resulting in an energy saving of 80 or 90 per cent.

A Solid-Contact Lampholder.

The J.K.W. Manufacturing Co., Ltd., 1 and 2, Bridge Street, Middlesbrough, has recently produced a solid-contact lampholder which embodies closely the design features of the ordinary lampholder without, it is claimed, the disadvantages of the previous designs of this type. The contacts are each of one solid piece and they are embedded in a porcelain base of the usual "S" design. The outstanding feature is the single spring which controls the two plungers together through the porcelain block. This rests on internal projections in the top part of the case, so that it always

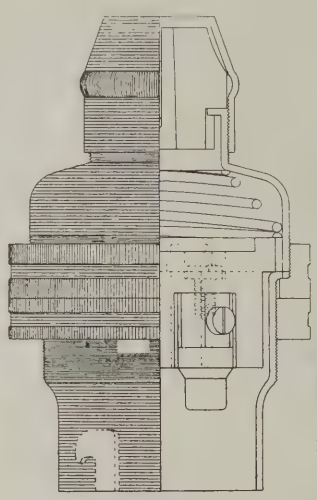

Fig. 3.—Solid Contact Holder, Part Section.

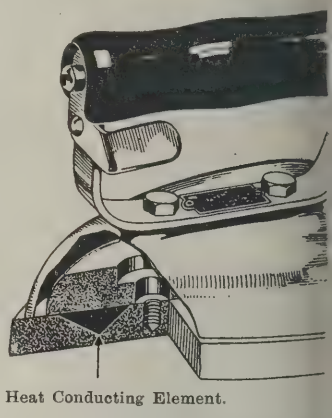

Fig. 4.—Improved Electric Iron.

remains in place when the porcelain is removed. The design of the device is such as to necessitate no departure from the usual method of wiring the holder, and it has exactly the same external appearance as the ordinary holder. Fig. 3 shows the device externally and in section. Electrical continuity is ensured by the solid contacts, and the latter are self-aligning. Arrangements are being made for the manufacture of types of bayonet holders other than that illustrated.

A Switch Development.

Messrs. S. G. Leach & Co., Ltd., 26-30, Artillery Lane, London, E.1, have sent us a sample of their new flush-pattern "Adnil" press-button switch, which they have recently introduced, complete with the necessary conduit box. The switch is constructed on an ebonite block which forms the face of the device, the mechanism being entirely enclosed

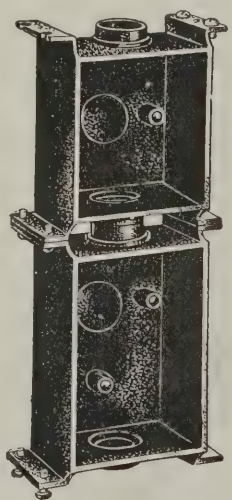

Fig. 5.—Conduit Boxes.

Fig. 6.—Press-Button Switches.

in the conduit box to which the switch is screwed. The action is positive and the break is quick and controlled by a V-shaped flat phosphor-bronze spring. The two press-buttons, "on" and "off," are also of ebonite, rendering the appliance shock-proof, and they are permanently attached to the switch contact arms. The external appearance is pleasing, and it is recommended for use in hospitals on the grounds that the plain polished surface will not harbour dust and that there is no risk of shocks.

The conduit box appears to be constructed of stamped sheet-iron and is fitted with external lugs and screws which enable two or more boxes to be coupled together where more than one switch is required. The box is provided with three entry holes for ¾-in. conduit, and reducing nipples are supplied in cases where it is required to use smaller conduits. Figs. 5 and 6 show two of the switches and two of the iron boxes mounted together.

Commercial Electric Cooking.

Final E.D.A. Conference of the Session.

Mr. D. N. Dunlop (B.E.A.M.A.) presided at the final Salesmanship Conference of the E.D.A. this session in London on March 26th. The subject for discussion was "Progress and Prospects of Commercial Electric Cookery," and Mr. J. J. McKenna, in presenting a paper on the matter, said that the rapid progress of the domestic electric cooker had been due mainly to the hiring out system, the low cost of electricity, the improvements in design to meet the requirements of the modern home, and the increasing reliability of the elements. The progress of commercial cooking, though not so rapid, was nevertheless satisfactory. There were numerous equipments all over the country giving excellent service and paying their way, proving effectively that electric cooking was not expensive and unreliable. Some of those commercial equipments had been in daily use for ten years and were still as serviceable as ever. There was still an enormous and practically untouched field for development, with a vast potential source of revenue for the supply authorities and a remunerative outlet for the energies of the salesman. It should be remembered, however, that the conditions governing the installation and use of kitchen equipment were not so favourable as those appertaining to the domestic electric cooker. Apart from the fact that the latter had the advantage of established hiring schemes to further its progress, the commercial equipment, on the other hand, was more often purchased outright and had the extra disadvantage that its operation was in the hands of a paid staff who probably would not handle it so carefully as the housewife. Future development should take account of the cost of energy, the suitability of the apparatus, and the question of reliability and quick operation. A good deal of spade work had been done in introducing electric cooking on a large scale into many canteens and restaurant kitchens, but sales in themselves should not be regarded as the main thing, because a good deal more harm than good could be done by pushing electric cooking of any description in circumstances where the conditions were adverse to the economic and smooth working of the equipment. For instance, it was directly harmful to push electric cooking where the charge for energy was 1½d. per kWh or over, unless the cost of gas was correspondingly high. There were cases, of course, where the quality of the cooking was of greater importance, but these were rare and too often the reputation of electric cooking suffered because the cost of energy was too high. It was fairly well established, from the records of electric kitchens that had been in daily use for a period of years, that the consumption of energy might vary from 0.2 kWh per meal cooked in a canteen using a combination of electricity and steam to 1.5 kWh in a canteen with an all-electric kitchen. The cost of energy should not exceed 1d. per kWh where competition was keen and should in most cases be in the region of ¾d. per kWh. Equally important was the necessity for supplying the right type of equipment for the requirements of the particular case. The general lines on which the needs of the purchaser should be studied were set out as follows:—The number and type of meals that were being served; the period during which the service of meals took place; the availability or otherwise of hot water for washing up and for cooking, also whether it was proposed to use a combination of steam and electricity for cooking, or electricity only; and the space available in the kitchen and servery. Care should be taken not to over-estimate the capacity of the equipment. Maintenance costs were at present high and they could be traced almost entirely to the failure of heating elements used in the boiling of liquids, and it was those same elements which were responsible for the majority of complaints regarding the slowness of operation of electric cooking apparatus. The manufacturer was therefore faced with the problem of producing a really quickly operating and efficient boiling plate, of limited dimensions containing a practically indestructible element. The solution would appear to lie in the use of a high resistance material other than nickel-chromium wire, if this were obtainable, or else in an absolutely enclosed and air tight element free from possibility of oxidation, *i.e.*, an element embedded in a substance of good insulating properties, of a high thermal conductivity and free from any tendency to powder through the "breathing" of the element wire. Such a material could confidently be expected in the near future. Once this difficulty had been overcome, there was nothing to stop the universal adoption of electric cooking for all purposes except the cost of energy. It was necessary to provide better facilities in large towns for the training of chefs and cooks in the use of electric cooking apparatus.

Discussion.

The ensuing discussion turned mainly upon questions affecting domestic electric cooking, and had little bearing upon the paper.

The Chairman himself dealt with the domestic cooking aspect by giving an indication of the progress that is being made by way of sales of apparatus. In the June quarter of 1924 he said there were more than twice as many domestic cookers installed as in the corresponding period of 1923, that number being six times as many as in 1922, and 30 times as many as in the June quarter of 1921. The figures for 1925 had not yet been completed but there were indications that they showed a considerable increase.

Mr. Rayner (Manchester) spoke of the rapid development of the domestic electric cooking load there and also mentioned that electric cooking was being taught at the Manchester College of Domestic Economy.

There were differences of opinion as to whether simple hire or hire-purchase was the better arrangement and Mr. Leevers (Hotpoint Electric Appliance Co.), who advocated the former, spent some time giving the outstanding features of the electro-inducer system which was described in our last issue.

Several speakers also severely criticised the shortcomings of the usual boiling plate, although one speaker said that its success depended upon sensible use by the operator.

Mr. C. H. Hayes put in a plea for a greater degree of standardisation of electric cooking apparatus as an important means for reducing maintenance costs.

Mr. Edinburgh commented on the difficulties encountered in inducing the chefs in large establishments to change over to a new method.

Several speakers urged the necessity for lady demonstrators of electric cooking apparatus rather than men.

Mr. E. P. Lovell (Stoke Newington) said that he had found an American cooker to suit his purpose best. What, he asked, was to be the attitude to adopt in such a case? Should he adopt British apparatus because it was British, or should he recommend the American? He was inclined to the latter view.

Mr. McKenna briefly replied and expressed his disappointment that so little had been said regarding commercial electric cooking. He particularly stressed the need for training kitchen staffs.

In all, there were 22 speakers in the discussion but there were practically no contributions towards the subject of the paper.

Mr. Beauchamp, in closing the series of conferences for the session, said that he was convinced that commercial electric cooking was going to be a big thing and he urged manufacturers to keep the Press informed, through him, of the progress and new developments that were being made.

Russian Electrical Notes.

The Schatur Generating Station. — The activity of the Schatur station in 1924-25 has just been reported on to the Supreme Council of National Economy. It is stated that the station carried out its supply programme to the extent of 81.5 per cent. and earned net profits amounting to 7,600 roubles.

Works for the extension of the station are reported to be in full progress, and the erection of three new boilers and the foundation for a third turbo-generator are proceeding, this machine being intended to be started next autumn. It has been decided to install two further 35,000-kW turbo-generators and the necessary steam-raising plant. The capacity of the station will then be 118,000 kW, as compared with the 83,000 kW originally contemplated.

The Accumulator Trust.—The report of the Accumulator Trust for 1924-25 shows that the production represented a value of 2,035,000 roubles, of which a total of 82.6 per cent. was sold. It is now proposed to increase the output of products which are in most demand. The Trust is said to have incurred a loss of 90,000 roubles in the past year.

The Electrical Bank.—At a recent meeting of the shareholders in the Electrical Bank, it was stated that during the eleven months ended with last November it had been possible for the bank to carry on without any subsidy from the State and that it had been able firmly to stand on its legs and take up a stable position among the large banks in Soviet Russia. The bank had recently been able to enter into an agreement with the National Commissariat of Finance under which the funds allotted for works of electrification in 1925-26 will be paid into the electrical bank. The net profits are stated to have amounted to 1,179,000 roubles in 1924-25; the share capital is to be increased to 15,000,000 roubles, and the term for short loans has been raised to one year and that for long loans to ten years.

Lamp Production.—The electrical section of the conference on the restoration of industrial capital has decided that it is necessary to organise the manufacture of lamps at the former Provodnik works, which has been leased to the General Electric Trust. The adaptation for this purpose will involve an expenditure of 2,700,000 roubles, of which 1,800,000 roubles is required for the acquisition of equipment. In connection with this scheme it is considered that the output of lamps should be increased to 67,000 per day and the costs of production largely reduced. It is also proposed to hand over to the Accumulator Trust the production of primary batteries.

The Shteroff Station.—As a result of delays in the receipt of certain equipment from abroad it is not expected that the Shteroff station will be opened for service until next May. The station will be the first of its kind in Russia to utilise pulverised coal as fuel. It will be equipped with 80,000 kW of plant, of which two Vickers turbo-generators, each of 10,000 kW, have been erected.

New Stations.—Schemes for the construction of various new generating stations have been placed before the Electric Planning Commission for consideration. Besides these particular projects the commission will deal with the proposal to erect a new large station to use South Moscow coal for supplying Moscow, and a committee will shortly meet to decide on the actual site to be adopted for the purpose of the station, which is to have a capacity of from 80,000 to 100,000 kW.

Growth of Electricity Supply.—According to information issued by the General Electric Commission, considerable expansion in the supply of electricity took place in the fiscal year ended with last September, particularly in the large industrial centres. The total production of the stations which are under the supervision of the Commission, forming 95 per cent. of the capacity of the public stations, is stated to have amounted to 1,131,000,000 kWh in 1924-25, as compared with 904,000,000 kWh in the previous year. The Moscow stations occupied the first place in 1924-25 with 365 million kWh, the Baku stations were second with 283.4 millions, and the Leningrad stations third with 211.6 millions. Including the other stations of public utility, the total output in the past fiscal year is stated to have been 1,200,000,000 kWh, while if the output of the private generating stations at industrial works is added the aggregate for the Republic comes to about 3,000,000,000 kWh.

Railway Electrification.—A commencement is to be made upon the electrification of the Russian suburban railways, the National Commissariat for Railways having recently placed orders with Soviet works for the construction and delivery of five motor cars and ten trailers for the Moscow suburban railways. Each train will be composed of one motor-car and two trailers as a rule. The trains will run on the Moscow-Losinoostrovska line and all the works are to be completed this year, while traffic will be commenced in the spring of 1927. An extension of the working is proposed as far as the stations of Pushkino and Schelkovo, together with other stations. The estimated total expenditure on the work is put at 30,000,000 roubles (£3,000,000).

The Productive Programme.—The State Planning Commission has approved a report relating to the electrical manufacturing programme for 1925-26. In 1924-25, based upon the list prices which prevailed in 1913, the value of the production of electrical manufactures amounted to 64.4 millions of roubles or 68 per cent. more than in the previous year. The gross value of the output in 1925-26 is estimated at 104.9 millions, of which 87.8 millions will comprise heavy products and the balance low-pressure manufactures. In addition the two trusts which are not subject to the Commission will turn out cables and other manufactures to the value of 25 millions of roubles. The execution of this programme will necessitate an increase in the number of workers from 20,500 to 27,000. The capital expenditure on the extension of the productive capacity of the works is estimated at 13,000,000 roubles, while a further sum of 12,500,000 roubles is needed to place the credit conditions of the industry in order, and most of this sum is to be advanced from the loan for the restoration of industry.

The White Sea Cable.—A special expedition is to be organised this year for the restoration of the cable between Archangel and Murmansk, which is now out of service, the length being about 500 miles.

Heating Apparatus Manufacture.—The General Electric Commission has decided that the bulk production of electric heating apparatus both for domestic and industrial purposes shall be embarked upon at the works of the State Electrical Trust.

Peat Fuel Station. — Having considered alternative schemes the Electric Planning Commission has decided that it is necessary to provide an additional capacity of 40,000 kW at the Krasny Oktyaber station for assisting in meeting the requirements of Leningrad. The Commission has referred the technical side of the problem to a committee to decide whether one or two sets should be installed.

Delays in Deliveries.—Complaints have been made by the Rural Electrification Department of difficulties in obtaining the delivery of electrical equipment. Applications and orders on the part of the peasant companies are increasing, but the department is unable to accept them owing to these difficulties. In the case of portable steam engines the Maltsov works states that it is unable to execute such orders in less than 10 months and even then only on receiving the necessary materials. Moreover, the works of the General Electrical Trust require from 14 to 18 months to carry out orders for generators and motors.

Development in Transcaucasia.—It is announced from Tiflis that the State Planning Commission has approved a five years' scheme of works, including the completion of the construction of the Erivan and several other stations during the current year. An investigation is also to be made of water power resources with a view to the establishment of various hydro-electric works in this region.

A Coal-Dust Station.—The Planning Commission has approved a scheme for the construction of a steam power station at the Artem Colliery in the Vlasovsk district, near Rostoff on the Don. By agreement with the Donetz Coal Trust it is proposed to fire the boilers at the generating station with anthracite dust to be obtained at a fixed price for a period of five years. The capacity of the station is to be 32,000 kW, of which one half will be installed initially.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Electricity Bill.—The following is a continuation of the debate, the first portion of which was given in our last issue, on the second reading of the Electricity (Supply) Bill.

Mr. G. Balfour said the Bill conflicted with traditional freedom and constitutional practice, as it set up a new authority answerable only to a Department with a right to allocate a State subsidy. Although our consumption of electricity per head was lower than in other countries, it did not follow that we were behind them. In 1905 private power companies supplied quite small consumers far out in country areas at figures like 0.673d., 0.712d., and 1.03d., in the county of Fife, and at 0.6d. in Lancashire, prices that were never touched in the United States. The American population had increased enormously, and the new-comers had no means of light or power but electricity. In 1922 the average price of electricity in the United States was 2.66 cents. The Commonwealth Edison Co., with an output of 3,091 million kWh, supplied electricity at an average price of about 1d.; other large companies at 1.125d. and 1.3d. The Lancashire and Fifeshire companies started at too low rates, with disastrous results. The cost of electricity used in industry generally amounted to only 2 or 3 per cent. of the cost of the finished material, in the United States and in this country. The Government relied on the Weir report, but the evidence on which it was based was not before the House; he declined to accept it, as in its main conclusions it was utterly untrustworthy. It was pointed out by the Minister of Transport that the Report did not represent a definite proposal, but that under the Bill a scheme would be constituted by the Board; the Electricity Commissioners had not produced a scheme in six years: would the Board produce one in ten? The Williamson Report was issued under war conditions; the Weir Committee accepted it, and called it the Weir Report, plus certain reports by the Electricity Commissioners. The Williamson Report stated that local rating applied to electric transmission mains must greatly interfere with the supply of cheap power and that the rating of electricity undertakings should be revised; the Weir Committee said that the selected and new stations and main transmission lines should be exempted from rating, but they did not propose to exempt the electricity supply industry from rating. Some large undertakings paid in rates sums of 25 to 35 per cent. of the amount of the coal bill, but the Williamson Committee's recommendation, which would have cheapened electricity, had not been followed. With regard to the change of frequency, some of the largest non-standard undertakings had unanimously resolved to oppose it, pointing out that the cost would be many times that calculated by the Government. The benefit of improved load factor could not be given to the consumer. They would find that America had not a "grid-iron." Mr. Alexander Dow, who was quoted in the Weir Report, said the Detroit Edison System was not a closely connected unity served by several power houses; loose linking throughout the entire System was their ideal. Economy was subordinate to the first purpose of interlinking, namely, mutual assistance. Mr. A. K. Baylor said that the effect of interconnection was greater availability and reliability of power rather than reduction in the cost of supply. There was danger in linking too large regions together and causing trouble over a large area. It was a mistake to suppose that wherever the grid went the rural areas would be supplied. Mr. Baylor stated that about 60 per cent. of the cost of supply in the cities and 90 per cent. in rural districts was for delivery, so that if energy could be generated for nothing, the charges for rural supply would not be materially affected. There were more power stations relatively to the population in America than in this country. The all-in price to customers at the Luton station was 1.05d.—the price aimed at under the Weir Report by about the year 1940. The Bill was merely a competitive political stunt pressed by the Executive, and would establish a bureaucracy of departmental control.

Sir Philip Dawson supported the Bill, subject to necessary alterations in Committee. Industry, he said, had been hampered by parochial legislation. The head of the A.E.G. in Berlin constantly told him that English works were not so well equipped as those of the United States; electrical power would increase their output. Some of our modern stations were amongst the most efficient in the world, but whilst some four million people benefited by the installation of electricity, a far larger proportion of the other 30 millions ought to have cheap electricity to carry on their work and improve their homes. If they could gradually go on reducing the cost of electricity throughout the country, it would increase the use of electricity in the home and the factory. He considered that technically and economically the proposals in the Bill would be useful to the spread of the electrical industry. The Williamson Committee's conclusions were as correct now as when its report was issued, and in addition the Weir Committee benefited by the valuable experience gained by the Electricity Commissioners during six years. The Commissioners were men of great experience, and their views were supported by the consulting engineers who advised the Weir Committee. Col. Morcom said the Weir report gave a true picture of what was needed to stimulate electrical development. Sir C. Wilson had said, in effect, that in Leeds they did not want to be interfered with by anybody; that proved the necessity of a

Bill of this kind. Cheap electricity for power, with cables along our main lines of communication, would make railway electrification feasible and assist the electrical industry by the railway load. Nothing was done for London's electricity supply until practically compulsion was used to bring about agreement in the London power area. To supply cheap electricity in the Greater London area it was necessary to scrap all the inefficient stations and to have capital stations interlinked with one another. According to Mr. Alexander Dow, stations were interlinked for safety and economy; but he saw no ground for the idea that they should be solidly connected up. If the big stations knew that they were bound to co-operate they would soon come together and work out an efficient system most advantageous to all of them. The Commissioners had produced no schemes because everything was voluntary, and the people would not work together. The system of interconnection had been carried out in the United States and Germany. The standardisation of frequency was desirable, but nothing in the Bill said that the frequency would be immediately changed everywhere. The 33¼ millions would be spent as, if, and when required. Frequency changers could be used if the amounts of power to be transmitted were not excessive. It was not suggested that the cost of electricity would be immediately reduced all over the country; it would be done gradually. Those who were producing cheaply should be willing and anxious to support other suppliers, so as to enable them to reduce their costs. Electricity must be pooled and sold by one selling authority; if any rights of existing companies or local authorities were endangered, he would oppose the clauses in the Committee stage. A selected station would be certain of selling practically the whole of its output, and of being paid for it, so that it would become a gilt-edged security, and there would be no difficulty in finding private enterprise to build new stations. It was not suggested that there would be immediate benefit for all rural areas, but he was satisfied that the benefits would become available gradually. When he visited Germany in 1921 with Mr. Hannon, he found the work on farms carried out by means of electricity, effecting a great saving in cost and an increase in output; waste heat from coke ovens was also used to supply gas and electricity over large areas. No body of men had helped the electrical industry more than the Electricity Commissioners, but a fundamental error would be committed if the new Board were to be a department of the Commission. It must be entirely independent; the best business men were needed, and in his opinion they could not be got together if they felt they were simply a department of another quasi-Government department. An appeal should lie to the judges or some entirely independent body. The Electricity Commissioners would continue to carry out their functions, but the great questions of policy and commercial management should be entirely in the hands of the Board and not subject to any other body. The Electrical Committee of the Federation of British Industries on March 24th resolved *nem. con.* that whilst it was in favour of the Bill receiving a second reading, it was not in agreement with various important clauses, including those governing the relations of the Board with the Electricity Commissioners. He suggested that the Board should be elected by the various interests connected with electrical supply, with an independent chairman.

Mr. Lloyd George declared that this country was in a humiliating position in comparison with other countries. It was about time we got along with the job, and if the Government could make a better job of the matter he and his friends would all be delighted to help them in committee. The Bill represented such real progress in the matter of the electrification and equipping of our industries with electrical power that he felt bound to vote for the second reading.

Sir R. Barnett, a Unionist, said he could not vote for the second reading because he objected to the Government's setting up a bureaucracy to control a great key industry. He also disliked the financial proposals of the Bill.

Mr. Snowden, winding up the debate for the Labour Party, said that the object of a publicly-owned undertaking was to supply a public need, and where there were profits, these profits were not distributed to useless shareholders, but went to the benefit of the community. This Bill was necessary because of the failure of private enterprise to give the public a satisfactory supply of electricity. Unionist members feared nationalisation through the Bill, but whether the Bill was passed or not, the sheer necessity to get relief from the inconveniences from which the public suffered would compel some Government—it might be a Tory Government—to go many steps further on the lines of nationalisation. The present measure did not go as far in that direction as the Bill of 1919. The Labour Party opposed the present Bill because it would not bring about effective co-ordination, and it did nothing at all with regard to distribution. Generation was important, but the most important thing of all was to get electric power and light in the factories and homes of the people. The Bill would do little or nothing to extend the use of electric light and power in the country.

Sir Douglas Hogg, the Attorney-General, replying to the debate, said that, while the Government would, in committee, resist to the utmost any amendment designed to wreck the Bill and to destroy its usefulness, they did not pretend that improvement was impossible or that a measure of this necessary complexity could not be modified and made more useful by the united efforts of the House of Commons. There were three questions which he thought a member might have put to himself in considering whether to take the responsibility of rejecting the Bill:—(1) Is the present position satisfactory? (2) If not, what is the best remedy from a technical point of view? (3) Does this Bill embody that remedy? The Weir Committee's Report showed that the cost of electricity to the people of this country was over 2d. per unit, but if adequate generation and transmission were provided, it should not be more than a penny. That showed that the present position was not satisfactory. As to the second question, as matters were not satisfactory, what was the right remedy from a technical point of view? Here they had a very large measure of agreement. Nobody seriously challenged the position that the right way to reduce general costs was, first, to have stations in the right place and of the right size, and, secondly, to link those stations up one with another, so that they might afford mutual assistance and lead to a reduction of costs. Those were the proposals contained in the Weir Report, and they were, also, in effect, the proposals of the Williamson Committee, so far as that part of the case was concerned. There could not, therefore, be any doubt that that was, electrically and technically, the right method to adopt. Did the Bill embody that scheme? It was an essential provision on which the whole machinery of the Bill turned that by the creation of a suitable body a scheme should be worked out under which the most suitable stations should be chosen and those stations linked together, and under which the generation of electricity would take place under the most favourable conditions and at the minimum cost. He regretted the attack which had been made on the Weir Committee, and paid a tribute to the Committee's work. The Weir Committee had consulted, among others, Mr. Merz, who was called in to advise not only by the biggest electricity undertakings in this country, but by undertakings all over the world. The Weir Committee had also taken the advice of Mr. Kennedy, who was electrical adviser to the London Power Company, electrical adviser at one time to the Southern Railway, and had advised a great number of the municipal undertakings in this country and abroad. These were the electrical experts who had been so scornfully described as men with no practical experience! Mr. Samuel Insull, who had had the greatest share in developing electrical enterprise in the United States, also gave evidence before the Weir Committee, and had since stated that, in his view, the scheme embodied in the Weir Report was the only scheme which could develop and save electrical enterprise in this country. He had offered his assistance in an advisory capacity in any way the Government might desire it. Mr. Dow was also in favour of the scheme. If any independent person in the country had been asked to name the people best qualified by means of their practical experience to advise on problems of this kind, they would have selected those whose names he had given. It had been suggested that another committee should be appointed; but there came a time when, as the Weir Committee itself said, it was time to take a decision and to give up taking evidence. "We suggest," the Committee said, "on the lowest computation that the magnitude and importance of the subject demands immediate and decisive action." There had been five committees considering this problem. They all said it was urgent and that something should be done. Yet after 10 years they were told that they must appoint another committee. He was not surprised that that suggestion was put forward only by those who quite honestly said that their object was to wreck and destroy the Bill and not to make it a workable one. As far as the Government was concerned they accepted the view of the Weir Committee that it was time to take action, and they invited the House to assist them. It had been said that the power companies would not work the scheme. He thought better both of the patriotism and the common-sense of those responsible for the power companies than to take that view. The power companies ought to be as anxious as the Government was to co-operate in producing what was an urgent public need—cheaper electricity for the people. Under the scheme they were guaranteed that they would have for the current produced the whole of the cost price of its production, including amortisation and interest on the capital necessary for its generation. Why should they not produce for the public good the current which was desired from their stations when, apart from motives of civic and patriotic pride, they knew that as a result of their doing it they were guaranteed, under the full responsibility of this State scheme, the whole of the cost of their generation, including interest and depreciation of their capital? He did not believe that any power company would be so short-sighted or so selfish as to refuse to work the scheme. It had been suggested that the amount allowed for standardisation was too low. They had asked Mr. Merz and his firm to spend some time in going through one of the typical districts—Birmingham—in order to ascertain motor by typical districts—Birmingham—in order to ascertain motor by motor what it would cost to effect standardisation. Mr. Merz had supplied a detailed estimate from which those responsible were able to approximate very closely to what the cost all over the country would be. It was from those figures, which had been approved by the Electricity Commissioners, that they had arrived at the figures which they had put in the Bill. If they applied to the investing public to lend £33,500,000 for this purpose on a five per cent. basis and without any State guarantee, they would not get a very adequate response. In order to cheapen the cost of electricity it was necessary to raise this money cheaply. The chairman of the London Joint Electricity Authority had given his unqualified support and approval to the Bill. No alternative proposal which had been put forward could compare with the proposals adum-

brated in the Bill, which he thought would be an unqualified success.

The Labour amendment to reject the Bill was defeated by 325 votes to 127—Government majority 198; and the Bill was then read a second time. A Unionist attempt to refer the Bill to a Select Committee instead of a Standing Committee was defeated by 416 to 45—Government majority 371.

Modernising Admiralty Generating Stations.—On March 24th Mr. Davidson, Financial Secretary to the Admiralty, informed Lt.-Commander Kenworthy that the establishments at which modernisation of the electric generating stations was being proceeded with were Portsmouth, Devonport, and Chatham Dockyards. The estimated costs were as follows:—Portsmouth, £254,000; Devonport, £166,000; and Chatham, £107,000. The work at Portsmouth and Chatham was well in hand. It would be completed at Chatham in 1926 and at Portsmouth in 1927. The Admiralty would keep in close touch with the Ministry of Transport about the progress of the general electricity scheme, but it was satisfied that there was no ground for postponing the fulfilment of the urgent needs of the dockyards on that account.

Weir Committee Witnesses.—On March 30th, Colonel Ashley informed Mr. B. Peto that the witnesses examined by the Weir Committee were:—Sir John Snell, Chairman of the Electricity Commission; Mr. A. Page and Sir H. Haward, Electricity Commissioners; Mr. J. S. Highfield, past-president, Institution of Electrical Engineers; Mr. R. A. Chattock, electrical engineer, City of Birmingham; Mr. C. H. Merz (Messrs. Merz & McLellan); Mr. J. M. Kennedy (Messrs. Kennedy & Donkin); Mr. S. Insull (Chicago, U.S.A.); and Mr. A. Dow (Detroit, U.S.A.).

"Selected" Generating Stations.—On March 30th, Mr. T. Thomson asked the Minister of Transport what was the number and capacity of the existing generating stations which it was contemplated would be selected stations when Section 5 of the Electricity (Supply) Bill became operative; and the number and capacity of existing generating stations which would not be selected stations.

Colonel Ashley referred the hon. member to Clause 4 of the Bill, where it was stated that the choice of the generating stations would be determined by the scheme which would be prepared by the Board, and submitted to the Commissioners who would inquire into the proposals. It would then be open to all interested parties to make representations on the proposals of the scheme, and only after this consideration by the Board and the Commissioners would it be possible to say which were the most suitable stations. The forecast which was contained in the Report of the Committee on National Electrical Supply, would not, of course, be binding on the Board.

An Increased Demand for Electricity.—On March 30th, Mr. Thomson asked the Minister on what investigations he had based the anticipated increased demand for electricity which, it was contemplated, would be met by the proposals contained in the Electricity (Supply) Bill.

Colonel Ashley said that the considerations on which the forecast was based were broadly set out in the Report on National Electrical Supply.

Direction-finding Apparatus.—On March 30th, Sir P. Cunliffe-Lister, President of the Board of Trade, informed Mr. Hayes that the number of British ships fitted with direction-finding apparatus on December 31st, 1925, was 263.

Bristol Corporation Bill.—On March 31st, on the second reading of this Bill, Lt.-Commander Kenworthy moved its rejection, as he took objection to Clauses 17-25, which, he said, enabled the Bristol Corporation to build a new generating station subject only to the consent of the Electricity Commissioners. This super-power station would be one of 120,000 kW; he suspected that the station was required for territory outside the city.

Col. Ashley, Minister of Transport, pointed out that the Corporation was not seeking powers to put up a station, but asked that, if and when the Electricity Commissioners should give it permission to erect a station it should be able to use land at Portishead for that purpose.

Lt.-Commander Kenworthy, however, objected to the granting of these powers. He feared that the West Gloucestershire Power Company—a private company—would be affected by the proposals of the Bill.

Mr. Hannon also took this view, and explained that the West Gloucestershire Power Company had established a station at Lydney and was already covering a large area, and he thought it would be very hard if a private company in which a considerable amount of public money had been invested should have its rights prejudiced.

Mr. R. Hudson and Sir T. Inskip denied that the interests of the Power Company would be prejudiced in any way. Sir T. Inskip said that the Corporation was determined to ask for powers to put up another station which would be adequate for the needs of its ratepayers and consumers. The Bristol Corporation area was not sought to be enlarged by this Bill, and the West Gloucestershire Power Company would have its hands full in supplying the area allotted to it.

The amendment was finally withdrawn, and the Bill was read a second time.

Legal.

Friend v. Chagford and Devon Electric Light Co., Ltd., and the Light and Power Finance Corporation, Ltd.

In the King's Bench Division on March 30th, Mr. Justice Rowlatt heard a motion for judgment in default of due delivery of a defence in the action brought by Mrs. Emma Friend, of Brixham, against the companies named above.

Mr. L. W. J. Costello, for the plaintiff, explained that the claim was in respect of preference shares which Mrs. Friend alleged she was induced to purchase by reason of false and fraudulent misrepresentations contained in two prospectuses issued by the defendants. She was making very serious allegations against the two defendants, and her case was that the whole thing was a ramp so far as those shares were concerned. In the circumstances it would have been thought that the defendants would have been only too anxious to put in a defence at the earliest possible opportunity. The statement of claim was delivered on February 9th, 1926, and under an order for directions the defence was due on February 19th. Nothing at all was heard from the defendants or their solicitors until March 9th, when they wrote a letter to the plaintiff's solicitors asking for further time in which to put in a defence. The reply of the plaintiff's solicitors was that their instructions did not admit of their giving them any more time. Nothing happened at all after that intimation. In the circumstances plaintiff waited another week to give the defendants an opportunity to apply for leave to extend the time, but as that was not done, notice of the present motion was served on the defendants on March 16th, 1926. The result of that service was that two days afterwards a document purporting to be a defence was brought to the office of the plaintiff's solicitors. That document was simply a carbon copy of another document signed by the defendants' solicitors. In the document the defendants put in a general traverse of all the allegations made by the plaintiff.

Mr. Justice Rowlatt: But if they have put in a defence now, I can't give judgment on this notice of motion.

Mr. Costello: They were a long way out of time.

His Lordship: I know; but the point of law is settled, is it not?

Mr. E. B. Calvert, for the defendants, said the defence to the action was a total and absolute denial of the allegations.

His Lordship: Oh, yes, a most eloquent denial!

Mr. Calvert: It is quite as likely to be true as the assertions now made on behalf of the plaintiff.

His Lordship: I dare say. There will be no order on the motion, except that the costs will be plaintiff's. They will be taxed and are to be paid within three weeks. If they are not paid, then the defence must be struck out.

Theft Charges.

At Old Street Police Court on April 1st, Walter F. Crispe, traveller, Mitcham, was charged on remand that being bailee of £6 15s. 9d., the money of John Eastwick, wireless manufacturer, Bunhill Row, E.C., he fraudulently converted it to his own use. Defendant was bound over for 12 months with his father as surety in £5.

At Old Street Police Court, on April 1st, Henry Vichion, a railway porter, was charged on remand with stealing and receiving a wireless condenser, the property of his employers, the London, Midland and Scottish Railway. There were now further charges against him of stealing and receiving a wireless transformer and clothing, also the property of the Company. Defendant, who pleaded "Not guilty" as regarded the transformer and the clothing, was sentenced to 14 days' imprisonment.

Patrick Corry was charged at Wigan Police Court, last week, with the theft of 140 yards of cable (value £7 4s.), the property of the Wigan Corporation. He was sent to prison for three months.

Hydro-Electric Power in Italy.—The *Board of Trade Journal* quotes some figures from a recent report relating to hydro-electric development in Italy during 1925. It is stated that during the year 55 new companies were formed with an aggregate capital of 25.1 million lire, bringing the total investment to 1,721.9 million lire. The capacity of hydro-electric stations was increased by 340,000 h.p. to 3,200,000 h.p., about 2½ times the 1914 figure. The consumption rose from 2,400 million kWh in 1914 to 7,600 million kWh in 1925. The consumption per head in Northern Italy is between four and five hundred kWh, but in Southern Italy the figure is only 50 kWh. It is estimated that 10 million tons of coal, valued at over 2,000 million lire, was saved during 1925. The necessity of thermal stations is gradually being reduced by the construction of large reservoirs. In addition, the transmission systems between North and South Italy have the same effect. Water power in the North is most abundant during the spring and summer when the Alpine snow melts, while in the South and Central regions winter rains swell the torrents of the Apennines. At the close of 1925 there was over 45,000 km. of h.p. transmission lines in operation, about 1,600 km. of which was operating at pressures above 100,000 V.

Correspondence.

Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

Private Generating Stations.

In your issue of March 26th you suggest that the Census of Production ought to furnish ample data to ascertain particulars of the above, but in your current issue it is reported that this Census is not yet available.

Now, as it has been estimated that the output (including traction) of private generating stations brings up the present annual consumption per head from 117 to 220 kWh, surely it is important that it should be somebody's job to get in touch with the owners of private generating stations, without waiting for the publication of the Census of Production. The owners of private generating stations are to be given special protection under Section 4 of the Electricity (Supply) Bill, and under Section 21 the Board is authorised to enter into arrangements with them for the purchase of their surplus electricity.

In his evidence before the Royal Commission on the Coal Industry (1925) Sir John Snell pointed out the several advantages to be obtained if owners of private generating stations joined up with a system like that which is proposed for the Central Electricity Board.

According to their annual reports, the Electricity Commissioners, under the provisions of Section 11 of the Act of 1919, have prescribed or approved the type of current, frequency, and pressure to be used at 32 new private generating stations proposed to be established during the period from January, 1920, to March 31st, 1925.

Perhaps further information could be obtained from the manufacturers of electrical generating plant, if it could be shown that such assistance would not operate to their disadvantage.

Grid.

London, *April 3rd*, 1926.

The Economical Loading of Power Plant.

The article appearing in your March 19th issue under the heading "Economical Loading of Power Plant," by Mr. J. S. Pillans appears to me to be somewhat misleading in so far as heat economy is concerned. The "Willans" lines shown in fig. 1 of the article are based on the assumption that two sets with identical steam-to-electrical conversion properties are run in parallel with the pass-out principle of steam extraction applied to one set only. The statement that the combined steam consumption of the sets is the same irrespective of loading is correct only when it is assumed that the increased steam consumption of one set is not utilised for power production. In other words, increased no-load steam consumption of the set in question.

In the case quoted by the writer, the major loading of the set, with the higher steam consumption, would be the most economical from a thermal view point, due to the saving in fuel obtained by the increased overall thermal efficiency of the plant resulting from the pass-out principle of heat reclamation.

On the other hand, take two sets, running in parallel, with a difference in steam consumption of two pounds per kWh generated, and assume that either the pass-out or bleeder method of latent heat recovery is applied to the set with the higher steam figure. In this case the resultant economy from heat recuperation would be offset by (1) increased steam consumption of the loaded set in producing the major portion of the power; and by (2) the inefficiency of running the lower steam-consuming unit on light load.

The fact remains, however, that, apart from recognised lines, there is a line of demarcation that decides overall heat economy. This may be obtained in graphical form from the potential heat expended as fuel, as ordinates, with the electrical output as abscissæ. The latter may be taken as being the criterion of efficient operation, and, in conjunction with the factor of equivalent fuel heat value, a truer and more reliable basis of comparison of power plant performance is obtained in preference to the existing antiquated and ambiguous pounds of coal and/or steam per unit generated.

W. D. W.

Hinckley, *March 29th*, 1926.

Doncaster Corporation Bill.

I have read the report of the evidence given before the Select Committee of the House of Commons as published in your issue of the 2nd instant.

I am more than surprised at the statements made by Mr. Purse, of West Ham, in referring to the South Shields Corporation Assisted-Wiring Scheme. Such statements as made by him are a direct reflection not only upon the Town Clerk to the South Shields Corporation, but also on the Electricity Commissioners, who sanctioned the borrowing of money in connection with the scheme.

I think Mr. Purse, before committing himself in the manner he did, ought to have had the courtesy to have communicated either directly with the Town Clerk or with the undersigned, who was responsible for the drafting of the scheme.

For his information I would state that the South Shields Corporation have full powers to carry out their wiring scheme in the manner in which they are doing it, under Clause 22 of the South Shields Corporation Act, 1915.

James Edgar,
Borough Electrical Engineer.

South Shields, *April 6th*, 1926.

Reviews.

The A.B.C. of Relativity. By Bertrand Russell, F.R.S. Pp. 231; figs. 7. London: Kegan Paul, Trench, Trubner and Co., Ltd. Price 4s. 6d. net.

The author of this book has a reputation which is world-wide, and well deserved, as a master of mathematical philosophy; he has also the gift of clear exposition, and abounds in happy analogies and apt illustrations: no writer of English excels him in bending simple language to the expression of difficult thought. All these qualities are much needed for the theme of the book before us, and all are conspicuously displayed. Notwithstanding this, the book demands concentrated attention from the reader. This is in the nature of the subject; but among the crowd of volumes now competing to inform the public concerning the intricacies of this difficult matter of Relativity, there are few, if any, so likely to give satisfaction to inquiring readers. Besides the Universe as conceived by Einstein, it contains some account of De Sitter's Universe which, unlike the former, does not require us to place a limitation on the infinite, or to believe in the possibility of "ghostly" stars; but makes *time* stand still where the distance is infinite. There seems some corroboration of such a possibility in the spectra of remote nebulæ, though nothing very convincing. When mathematical philosophers begin to present us with a choice of possible universes in which to believe, we begin to feel ourselves more at liberty to reject any one of them, and it may yet be that we shall come to reject them all, on the ground that the contradictions they raise are as flat as the contradictions they reconcile. At present the most simple and obvious sequence of events with which we are acquainted demands a *geodesic* to explain it, and the interval separating the events must be measured by a standard which confuses time and space in such a way that there is no telling one from the other. Such a standard is inconceivable to man. So the simplest and most obvious thing we know, is to be explained by something we cannot even conceive; as is pointed out in a book we recently noticed, "The Ego and Physical Force": and it certainly does seem odd to call such an explanation scientific. However, anyone interested in such problems cannot do better than consult Bertrand Russell's book on the subject.

Elementary Electrical Technology. By A. M. Parkinson, B.Sc.Eng.(Lond.). Pp. x + 179; figs. 129. London: Oxford University Press. Price 6s. net.

A book on Electrical Technology would be expected, naturally, to deal with the basic science underlying some branch, or branches, of electrical engineering, but in that respect the title of the book before us is quite misleading, for it is concerned entirely with calculations on the electric and magnetic circuits. The author's main purpose is to provide the reader with an assortment of formulæ for solving problems on circuits and, having set out a number of worked examples, to give him a series of exercises in the application of these formulæ. Provided the book is used in conjunction with another which deals adequately with Electrotechnology, or is used by students attending a sound course of lectures in that subject, it may be very useful, but not otherwise.

It is a strange thing that so many writers and teachers regard the young of our species as born with an instinctive knowledge of the laws of the hydraulic circuit. Thus our author says that the loss of pressure when water flows along a pipe is "obvious," that we may discuss the hydraulic circuit and, by applying the same process of reasoning (*sic*), draw conclusions regarding the drop of pressure in electric conductors. This is merely cheating the elementary student, who is next told that "the convention for the direction of flow of an electric current is that current flows from the higher pressure to the lower pressure, *as compared with the earth* (our italics), or, as generally stated, from positive to negative." The student who really wants knowledge may search through the book in vain, however, for some hint of how he is to distinguish the higher from the lower pressure, or identify the positive and the negative. Shortly afterwards the author says that "the various terms for denoting electrical pressure are used somewhat loosely," and the reader will agree.

The beginner has few stumbling blocks in his path which are so difficult to surmount as the magnetic quantities, yet the author blithely puts him in the way of making calculations on the magnetic circuit, without ensuring that he attaches any adequate meaning to B and H.

The chapter on the alternating current circuit is by far the best part of the book, though it suffers from superficiality like the rest.

The last chapter is on the oscillating circuit, and if the students for whom the book is intended can really assimilate this, then the material in the thirteen appendices, which

contain, for the most part, concise proofs of the formulæ used in the book, might have been interspersed through its pages and the treatment might have been made more logical even if more forbidding.

Judging from the very large number of elementary textbooks which continue to be written, it appears that the difficulty of the task is not appreciated by those who essay it, and intending authors would do well to take as their model a classic by some master teacher such as S. P. Thompson's "Electricity and Magnetism."

There is evidence that Mr. Parkinson is not without qualifications for this task, but he would be well advised to lay more stress on fundamental principles.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from March 31st, 1926 :—

Timeoscope. No. 466,356. Class 8. Instruments and apparatus for use in radio-telephony and telegraphy.—Ideal Radiotelefon & Apparate Werk Gesellshaft, 10a, Kupenicker Strasse, Berlin. (British representative: Lewis W. Goold, 5, Corporation Street, Birmingham.)

Phœnix (lettering and design). No. 463,156. Class 8. Thermionic valves.—Thermionics, Ltd., 639, Salisbury House, London Wall, E.C.2.

Four Green Stripes (design only). No. 465,315. Class 8. Electric cables having braided covering.—Callender's Cable & Construction Co., Ltd.

Agnit. No. 467,088. Class 8. Instruments and apparatus for use in radio-telephony.—A. W. Lotinga, trading as Lotinga & Co., 25, Midland Street, and 47, George Street, Hull.

Lustrolux. No. 466,798. Class 13. Electric lamps (ordinary).—Lustrolux, Ltd., Albert Road, Bollington, Ches.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The

Electrical Review

VOL. XCVIII. APRIL 16, 1926. No. 2,525.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Electricity Supply Data.

IN view of the frequent comparisons instituted between this country and the United States in respect of the development of electricity supply, some figures extracted from the *Electrical World* of January 2nd, 1926, may be of interest. These show that in 1913 the average price of electricity for lighting was 8.7 cents, say 4.35d., per kWh; in 1925 it was 7.5 cents, or 3.75d. There are 6,000 light and power systems in the United States, with 17,937,160 customers; the population being about 116 millions, there are nearly 52 undertakings per million residents. In this country there are 565 authorised undertakings and perhaps 30 unauthorised, a total of 595, and the population being 43½ millions, we have only 13.7 undertakings per million. There are in the United States 4,800 generating stations, or 41.5 per million inhabitants; we have 584 authorised stations and, say, 30 non-statutory, or only 14.1 per million inhabitants. The plant installed aggregates 26,830,000 kVA, say, 21,500,000 kW, or 185,000 kW per million, against our 3,100,000 kW. or 71,500 kW per million. The central-station output in the United States in 1925 was 59,517 million kilowatt-hours *generated*, or 514 kWh per head; the energy *consumed* was 47.997 million kWh, or 414 per head.

Here we must pause for a moment, as an important question arises. In a recent issue we discussed the validity of the data published by the Government for the consumption of electricity in this country, and we note with interest that a question has been addressed to the Minister of Transport in the House of Commons asking for the figures for 1925, including the amount of energy generated by private plant. The answer may not be known in time for inclusion in this issue. In the meantime, we wish to direct attention to the American data. The Report of the Weir Committee states (p. 5) that the consumption of electricity per head of population in the United States, according to the latest available returns, is 500 units. The latest figures available at that time must have been those for 1924, namely, 54,413

million kWh generated and 43,893 millions consumed. Taking the then population of the United States at 114 millions, *the energy generated was 477 kWh and the energy consumed 385 kWh per head.* It appears, therefore, that the computer of the Weir Committee's figure made the serious mistake of basing it upon the *energy generated*, and comparing the result with the British figure for *energy consumed.*

The relative figures for energy consumed per head in 1924 should therefore read as follows:—

United States	385
Great Britain	117

not 500: 110 as given in the Weir Report, for electricity supplied by central stations.

In the Third Annual Report of the Electricity Commissioners (p. 7) it was stated that the Commissioners had a "substantially complete list of the owners of *all* generating plant in operation during the war for public and individual purposes, inclusive of non-statutory and private undertakings," which, they thought, might serve as a valuable basis for the preparation of a census of the generating plant installed, which would constitute a "valuable asset" in dealing with the reorganisation of electricity supply. That valuable asset, unfortunately, has not been realised, as in his evidence before the Coal Commission, Sir John Snell could only give an estimate of the output of private plant, bringing the total consumption from 117 kWh up to a probable value of 220 kWh per head. In the United States the number of private industrial power stations is known—namely, 8,157, and their output is 12,000 million kWh (1925). Disregarding possible losses in distribution, probably small, we may add this figure to the consumption of consumers on the public mains, making a total of 55,893 million kWh in 1924, or 490 per head. The comparison on a just basis is therefore—

United States	490
Great Britain	220

or 2.23 to 1, for electricity obtained from all sources.

The average price received in the United States in 1925 was 1¼d.; here it was 2.05d.

According to our contemporary, "the central-station industrial field as it exists to-day is only 37 per cent. developed" in the United States, though "almost 55 per cent. of the population of the nation is now living in electrically-lighted dwellings." "During the last year commercial efforts were concentrated on building desirable new loads." Great stress is laid on the necessity of making the increased consumption per domestic customer a foremost task for the years to come.

Nearly one-third of the whole output in the United States is derived from water-power, and whilst we agree with the statement often made that electricity generated by water-power is often no cheaper than that obtained from fuel, we would point out that water-power can only be distributed by conversion to electricity, whereas coal and oil can be distributed and utilised for power production without such conversion. There can be no doubt, therefore, that countries liberally endowed with water-power are certain to make a better electrical showing than those dependent mainly on fuel. Moreover, it is a characteristic of water-power that, as a rule, the standing charges are entirely predominant in the cost of generation, so that there is the strongest possible inducement to develop long-hour loads and high load factor; consequently enormous outputs in kWh are obtained from installations of comparatively small kilowatt capacity. On the other hand, when energy is derived from fuel, as in this country, the cost of the fuel is the predominant factor in the working costs when long-hour loads are in question, and there is not an equal incentive to strive after the development of such loads. In this connection it should be observed that the cost of distribution to large industries is relatively a minor factor; in the case of domestic consumers, of course, it is by far the largest item, and may reach 90 per cent. of the total when rural supply is in question. It is vastly more important to reduce the cost of distribution than to reduce the cost of generation.

Between 1920 and 1925 the total consumption in the United States rose by 50 per cent.; the estimated consumption for lighting increased by 80 per cent., for power by 43 per cent., and for railways by 34 per cent.

The Lighting of Printing Works.

It has been frequently pointed out that problems in industrial lighting are best solved with the help of the Joint Industrial Councils, on which both masters and men are represented. It is pleasing to observe that the Joint Industrial Council of the Printing and Allied Trades is taking great interest in illumination. Mr. L. Gaster, who has delivered several lectures on the lighting of printing works, again dealt with this matter in a lecture arranged by the Aylesbury and District branch of the Council last month. Printing works in the neighbourhood were well represented in the audience, and the discussion raised several points of interest. Amongst these were the effect of changes in the shape of compositors' frames, and the effect of polished reflection from new type. The trouble of glare from such bright surfaces can be partly checked by proper shading and diffusion of light. At the same time, diffusion should not be carried too far, as a certain amount of shadow is desirable to throw the type into relief and enable it to be clearly seen. Illuminations of 10 to 20 foot-candles are not uncommon, and even higher values are recommended in some quarters. It may be recalled that the conditions of lighting desirable for compositors' work are now being studied by the Committee on Illumination working under the Department for Scientific and Industrial Research. The recommendations of this Committee should carry considerable weight, and the results of its work are awaited with much interest.

The Coal Mining Industry.

The very broad acceptance by the Mining Association of the recommendations of the Coal Commission merits the appreciation of the workers and of the general public, and augurs well for the future of the coal-mining industry; it is to be hoped in spite of the intransigent attitude adopted by the delegate conference that was held in London on Friday last, that the Miners' Federation will consider the subject in a like spirit, and that the parties will speedily arrive at an amicable agreement on the points on which they have been at difference, some of which, we fear, will not prove easy of settlement. Leaving these controversial matters on one side, it is for us to note that the Association offers no opposition to the proposed amalgamation of small mining properties, or the establishment of a National Fuel and Power Committee, and welcomes the principle of extended research, the proposal to set up official stations for the sampling and analysis of coal, and measures to secure the adoption of larger railway wagons. All these proposals closely affect the electrical industries for the most part in a favourable sense. The amalgamation of small collieries would facilitate the adoption of electric power; research is sure to bring its own reward; the purchase of coal to specification will at last become feasible, and improvements in the means of transportation will tend to lower the cost of fuel in the bunkers. But of the proposal to establish a Fuel and Power Committee we are deeply suspicious; coming from that quarter, it implies, as we have previously suggested, the subordination of electrical interests to those of the mining industry, amounting in effect to a veiled subsidy, and for that we have no liking. We have suffered too much already from the politicians to wish to be controlled by any body having external interests to serve.

How One should Buy Electric Vacuum Sweepers.

An Outline of Genuine Tests which will Prove the Merits of a Machine.

By H. HARRISON DENT.

The Need for Tests.

The electrical appliance market has been developing strongly in Great Britain, and there are numerous makes of different types of appliance on the market. The trade purchaser and the general public are confronted with so many alternatives that they both need some guide or some satisfactory methods of testing the appliances they are about to invest in.

Advertising in the trade and general Press is the principal means of drawing attention to the products of manufacturers, and while "Truth in Advertising" is a delightful and ideal slogan, we must beware of accepting all the claims, sometimes almost obviously extravagant, which are put forward for certain makes of appliance.

The electric vacuum sweeper is one of the most popular of these appliances, and is of great importance to the buyer—trade or public—because it is an expensive item representing a big stock investment, and is the most important appliance in the home. At least this is probably the opinion of the majority of housewives.

To the trader and the merchandising supply authority the question of terms, discounts, manufacturer's publicity service and repair service, &c., is a very vital consideration, and these points he will investigate amongst the various manufacturers whose potential customer he is. But the public is not interested in the trader's financial and stock problems so much as in the answer to the question: "Is this vacuum sweeper the best on the market, or is it the best combination of moderate price and efficient working?"

The answer lies in testing the different makes one against the other by simple, standard tests which give absolute proof. This article will attempt to lay down some of the more important of these tests as the result of experience in handling competitive types of machine, and will also indicate some of the spurious or "trick" tests that have been used by unscrupulous selling agents to demonstrate apparently superior performance against what is actually a more efficient machine.

We would premise as the result of this experience that the most advertised machine is not necessarily the best, but that every make possesses certain good points, and has its own standards of performance and peculiarities of construction.

General Features of Design.

The electric vacuum sweepers on the British market may be classified under two types, those which combine suction with brushing and those which use suction alone.

In considering the merits and demerits of these two types we must bear in mind that the primary object of the machine is to clean the carpet thoroughly without harming it. It is taught by experience that a too high vacuum is injurious to a carpet. The ideal method is to have a brush gently beating the pile of the carpet or rug with an adequately powerful vacuum lifting the dust and dirt into the bag. The purely suction type will lift loose dust but it cannot efficiently tackle dirt that is embedded in a carpet as the result of wetness and dust—the compound familiarly known as mud.

Of the brush-driven class of cleaner there are two types, the flat-nozzle machine with castors, specially designed to lift the carpet and then brush it, and the simple brushing and suction type. For the first type a more thorough cleaning power is claimed by the makers, but it is held by some authorities to be damaging to carpets.

Most rugs are backed by a species of shellac or glue sizing which prevents dirt from penetrating through to the floor; it is contended that the drawing-up and bending of a rug buckles up the backing and tends to dislodge it from the rug, spoiling its strength and appearance.

Having discussed main design features we will consider the tests that should be made where possible to show comparative or actual performance.

Carpet and Rug Cleaning Test.

A simple test for two different makes of machine, say, "A" type and "B" type, is to obtain an old and dirty rug or carpet, divide it into two equal portions for cleaning purposes, and operate each vacuum sweeper the same number of times each on its respective half. The two bags must be completely empty before commencing, and should be weighed. At the end of a predetermined time or equal number of strokes over the carpet halves, the bags are taken off and weighed again. The increase in weight of each bag will then represent the weight or quantity of dust that each machine has been able to get out of the carpet. If "A" machine records twice the difference in weight recorded by "B" machine, then "A" machine is the better carpet cleaner. If desired, instead of weighing the bags before and after test, the dust itself can be weighed after emptying. When the difference in volume of dust is very great this second version of the test will be sufficiently accurate.

The machines "A" and "B" should now be transferred to each other's half of the carpet. "A" will operate on the half previously covered by "B," and "B" will operate on "A's" half, again for a definite time or number of strokes. The time must be longer at this second attempt as a large amount of dirt will have been already extracted.

The weighing methods will be repeated. It is apparent that if "A" succeeded in getting double the amount of "B" in the first test, then "A" should again show a better performance, for the half "A" is now working on cannot be so clean as the half "A" worked on first of all. The results of this double test are, therefore, very conclusive.

A test for the cleaning-up of embedded dirt can be improvised by mixing up flour and water and putting this mixture on a rug and allowing it to dry. After a few minutes a purely suction type vacuum sweeper should be run over the caked mixture to test how much can be removed. A brush and suction machine should then be tried on the same rug and the comparative performance noted.

Considering relative carpet cleaning abilities we may try yet another simple test. Using two machines "A" and "B" type, clean a strip of carpet, and then take off the bags and run either machine until no more dust is seen coming out of the air pipe outlet. Select the apparently weaker machine, say, "B," and run it over the cleaned strip for four complete strokes, with the bag off, and hold a piece of moistened paper at the air pipe outlet, gathering any dust blown forth on the paper. Then repeat this performance with the "A" machine and compare the quantities of dust gathered on the two moistened pieces of paper.

Suction Power.

Apart from its carpet cleaning power, suction is of special importance when using the various cleaning tools, for the brush is now not operating and suction power alone is the dust removing force.

A simple test is to take " A " and " B " machines and disconnect the brushes. To do this some types have to be turned upside down and the rubber belt disconnected from its driving pulley, while a metal plate is removed. In the more advanced type of vacuum sweeper a simple switch is provided on the motor carriage to cut the brush out of gear, avoiding unnecessary labour and time wasting. With both brushes off the two flexible extension tubes should be fitted on, and the end of one tube connected to the end of the other. A rubber sleeve will do this effectively. This connection puts the two suctions in opposition, and it is obvious that when both machines are running the more powerful one will gradually deflate the bag of the weaker machine. If there is no difference in suction power both bags will remain inflated.

This is a comparative test which anyone can make between two machines. A very exact test can be made with a simple water gauge known as a manometer. This consists of a " U "-shaped glass tube containing water, mounted on a board marked in inches of height along the tubes. A rubber connection tube is provided for attachment to the flexible tubing of the vacuum sweeper. Each machine is operated and a definite figure of suction-power in inches of water on the gauge will be recorded, showing the relative power.

Spurious Tests.

There are certain spectacular but useless tests against which the unsuspecting potential purchaser should be warned.

A common example is to take two different makes, " A," which the demonstrator is trying to sell, and " B " the rival make. After running " B " machine several times over the carpet or rug chosen, the ingenuous demonstrator will run his " A " machine over the same portion of carpet with the bag off; and out flies a cloud of dust! The apparent inference is that " B " machine has not done a proper job and that " A " machine is superior. This is sheer rubbish, as had the two machines been reversed the identical performance would have occurred. The truth is that no single vacuum sweeper can clean a carpet or rug perfectly the first few times it is run over, and, moreover, if it did do so it ought to be destroyed in the interests of housewives. A machine capable of removing all dust and dirt in a few strokes would be so powerful that it would damage the carpet badly. Gradual cleaning is essential with electric vacuum sweepers.

In any case, it is not a fair comparison to run one machine with the bag off against another machine with the bag on. The first machine has extra suction power as its fan does not have to work against the back pressure of the air in the bag.

A further point of interest lies in the fact that an adequately strong machine would not balloon dust into the air when its bag was off, but would project it some distance in a column of air—say, six or eight feet away.

Other Features.

Certain machines when running transmit considerable vibration to the handle of the cleaner, a rather unpleasant feature. This may be caused by too rigid a fixture of the handle and by the method of mounting the motor.

Motors are mounted either horizontally or vertically on the carriage of the cleaner, and the vertical type tends to set up vibration. Generally, the vertically mounted motor needs more frequent oiling than the horizontal type.

All vacuum sweepers are provided with a long flexible cord ending in a plug for plugging into lamp sockets. Each machine possesses a motor switch to start and stop the motor.

Of the brush and vacuum type machines there is at present, as far as it is known, only one make on the market which has a special switch for cutting the motor out of action. All the other types need turning upside down, taking off a plate, and slipping off the pulley belt.

The brush should be of strong construction, but the bristles must not be too stiff or the speed of rotation too high. The best type of design utilises a high-speed motor to obtain the necessary suction with a gear for connecting up the brush and operating it at a much slower speed, avoiding the possibility of damaging a carpet.

For ease of operation certain makes are automatically adjusted to any type of carpet while others need special adjustment for different types of rugs and carpets.

These are minor details of design which, however, are quite important from the point of view of the housewife who likes to have a machine which gives the least amount of trouble and needs the least amount of adjustment.

The question of " finish " is worth noting, as appearance is a strong selling point. Some machines are equipped with straight handles, others with the end of the handle curved downwards for ease of operation.

The lugs on which the trailing lamp-socket lead is wound should be finished the same colour, polished metal, enamel, &c., as the handle; the bag should be strong, simply fitted, and easily undone and replaced, and fitted with a dust trap or valve to prevent dust falling out when the bag is removed. Some types use a metal dust container in lieu of a bag. While this feature adds to the weight of the machine it does not appear to possess any advantage over the bag type. This is a feature decided upon by personal taste.

The change over from brushing to suction should be simple, and the extra equipment for general cleaning should be complete. Every machine should have in addition to the braided flexible suction tube, a suction wall-brush, a curved suction fitting for upholstery and picture-rails, and a flat-ended pipe for cleaning the recesses of armchairs, &c. In addition, an extension piece for reaching high places and a curved tube for adjusting in all directions should be provided. One type makes a special feature of supplying in addition a vacuum-mop for cleaning floors and oilcloth. No doubt the variety of extra tools will increase as manufacturers hit on new ideas for improvements. The brushes or mops forming part of the extra tools should be capable of easy removal from the body of the tool for cleaning purposes.

Comparative suction power is of greatest importance when considering the use of these extra fittings. Apart from the initial force of suction the fittings must be so designed that there is no chance of leakage or power loss when in use, and the final tool should not have too large an open end. It is obvious that the suction at this point will vary inversely with the area of the open end, *i.e.*, the smaller the area the greater the suction.

These are the main points which should be investigated carefully before the retailer decides to stock a particular pattern of machine, and before a private individual decides to purchase. The claims of the rival schools of thought, brush and " no brush," must be impartially weighed in the light of the functions to be performed.

In the experience of the writer there is no question but that the brush and suction type secures more dirt than the purely suction type, and there is no evidence to show that brush operation damages a carpet.

The primitive method of carpet beating by man (or woman) power applies considerable force to the carpet and much of the dust beaten out settles on it during the process, and is beaten in! A rotating brush does not apply such a violent impact, and runs tangentially to the carpet surface instead of applying a direct force. The brushes used for this work are far more soft and pliable than the primitive stiff bristle broom, and while their operation is fast there is no evidence to prove that they are harmful. Nor is there any reason to suppose that the pure suction machine causes any damage unless extremely high suction has been used to compensate for the absence of a brush.

The only countries where sufficient accumulated experience of the effects of these machines on carpets and materials is available are the United States and Canada, and the huge growth of sales of both types of machine in past years in these countries is the most significant defence of the efficiency of the electric vacuum cleaner.

The "Gyro Gasification" of Coal.

The Use of Powdered Kent Coal at the Dover Corporation Electricity Works, on the Lindley Duffield System.

So far as is known, the distinction of being the first and only electricity generating station in this country to produce the whole of its output of electrical energy by the utilisation of pulverised coal belongs to the Dover Corporation undertaking. This is no mean achievement, for the inherent difficulties encountered, both in the coal-pulverisation process itself no less than in the firing of water-tube boilers with the powdered fuel, are diverse and numerous; so much so, in fact, that the different fuel-pulverising installations which have been, are being, or are to be installed in British power stations are regarded as somewhat in the nature of experimental plant which has yet to prove its worth, notwithstanding the apparently satisfactory operation of similar equipment abroad.

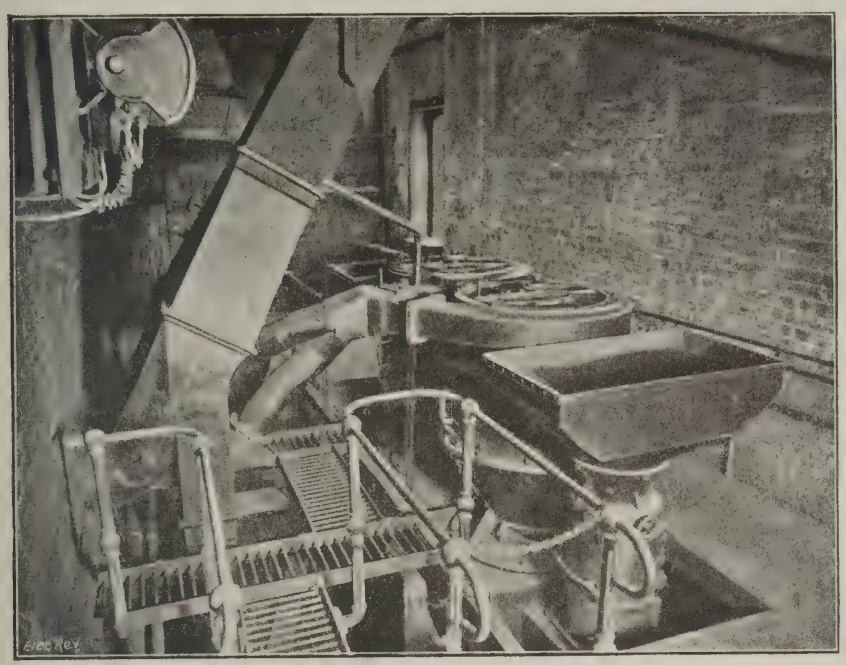

Fig. 1.—General View of Pulverisers.

The successful application of the principle at Dover is claimed to be due to the fact that the well-known difficulties already alluded to have been substantially overcome by the utilisation of methods recently introduced by Messrs. Lindley Duffield & Co., Ltd. The system that is in commercial operation at Dover is of more than ordinary interest, for it differs wholly in several material respects from the orthodox process, and seems to be very promising.

The Vickers-Spearing boiler concerned has a nominal capacity of 30,000 lb. of steam per hour; it is equipped with a superheater and a superimposed Green economiser. Due to the nature of the sub-soil—the boiler-house floor being but 17 ft. above sea level—adequate foundations could not have been built for the installation of chain-grate stokers, an outstanding feature of the "gyro gasification" method of firing being the comparatively small headroom needed below the boiler tubes; as is indicated in fig. 2. little room is required for the accommodation of the pulverisers and auxiliary plant. Two separate 15-h.p. motor-driven "gyro" pulverisers, the dimensions of which are indicated in fig. 3, have been installed, so interconnected that either, or both, can feed either, or both, boiler furnaces as shown in fig. 1. Kent coal is burned, obtained mostly from the Tilmanstone and Chislet pits; it is broken up in a roll crusher, passed through a jigging screen (for the removal of stray pieces of metal and other heavy foreign matter), and then hand shovelled into the hoppers of the pulverisers (a temporary expedient pending the installation of conveyors). At the bottom of the hopper is a preliminary conical crusher which further reduces the size of the coal before it drops on to a stepped pusher plate, worked by an eccentric, which feeds the fuel forward into the bottom of the pulveriser. As will be evident from fig. 3, the pulveriser consists of a series of members on a vertical spindle rotating at approximately 1,450 r.p.m., with a clearance of about an inch between them and the casing; the latter is lined with deeply serrated plates, against which the coal is thrown by the beaters. A fan on top of the machine, driven by the same spindle and 15-h.p. motor, induces an air current to flow upwards from an opening below through the pulveriser, with the result that so soon as the coal is reduced to such a fineness that it loses its susceptibility to centrifugal force and becomes buoyant in the air draught (which is the controlling factor of fineness), it is sucked away from the beaters towards the centre of the machine and thence upwards and out at the top, whilst the larger and heavier particles of fuel remain behind until thoroughly disintegrated. It is thus clear that the Duffield "gyro" pulveriser is of the impact type; the fuel is not ground, and, as it enters at the bottom of the machine where the beater arms are shortest, fig. 3, pulverisation commences at a lower linear speed, the impact violence increasing as the finer particles rise into the zone of the longer beater arms, so graduating the linear speed according to the size of particle. Moreover, in consequence of the finely

Fig. 2.—Part of the Boiler House, Showing New Plant.

powdered coal being afforded continuous egress out of the machine, the beaters' action on the larger particles of coal is neither impeded by the cushioning effect of the unnecessary presence in the machine of finely-powdered fuel, nor are they burdened by having to churn particles which are already sufficiently fine. These features are power-saving, and at Dover it is found that on commercial load the pulverising process (including all fans and auxiliary plant) absorbs 3 per cent. of the energy (kWh) generated. Tests show that 1 ton per hour of Scottish washed nuts (2,450 lb. devoid of fines) can be pulverised

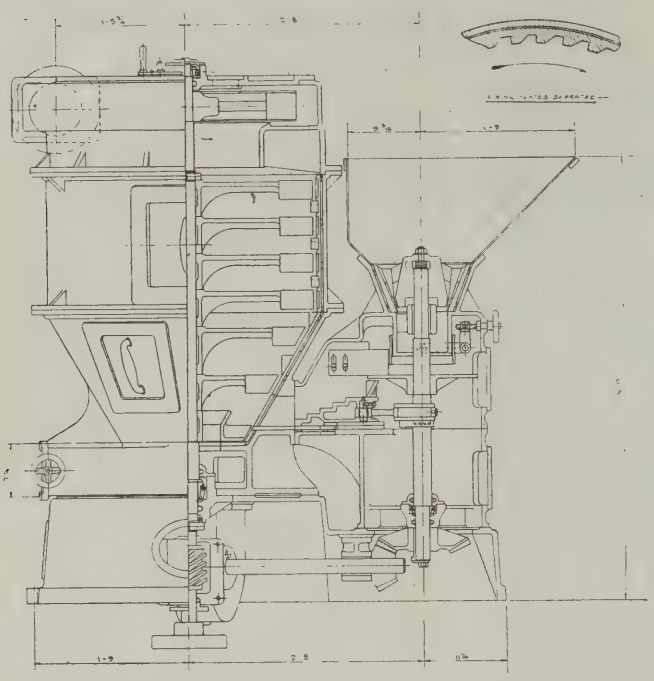

Fig. 3.—The Lindley Duffield Pulveriser.

for 15.6 h.p. inclusive; indeed, it is probable that a slight modification of the design of the pulveriser casing and a rearrangement of the fans and motors driving them would reduce these figures. At Dover it is not found necessary to dry the coal before it is pulverised, as Kent coal contains less than 5 per cent. moisture.

The most interesting portion of the equipment, however, is the furnace itself, both from the point of view of size and arrangement. In place of the enormous combustion chambers which have become associated with boilers fired with pulverised fuel, requiring about 1 cu. ft. of space per 1 lb. of coal fired per hour, two slightly oval "gasifiers" are used (one-tenth the above-mentioned volume). The compactness of these chambers reduces the amount of refractory lining required, and consequently enables high-grade aluminous bricks to be employed for that purpose, *i.e.*, "Leolite," made of special clay imported from India. Such bricks, which are understood to withstand a temperature of 1,850 deg. C., are somewhat expensive, but the smallness of the chambers justifies the expense; the number needed to line a gasifier is only 2,500 6-in. bricks, equivalent to 1,666 9-in. bricks (an American standard combustion chamber for firing the same amount of coal would require approximately 11,500 9-in. bricks), and we are told that the annual cost of brick renewal in the case of a boiler of the size of that at Dover need not exceed £50. The brick work at Dover has been guaranteed for two years, and it is not called upon to resist an impinging flame, for the fire is ingeniously controlled so as to protect the lining.

It is shown in fig. 4 that the fuel is injected tangentially, so that it sweeps round the furnace and forms a powerful vortex. The secondary air necessary to complete combustion is also admitted tangentially in the same direction as the coal, partly round the fuel-inlet pipe and partly at a lower level of the gasifying chamber. The division of the secondary air in this manner affects the position of the combustion zone, for by admitting the preponderance at the bottom of the chamber, more expansion accrues from the greater opportunity it has of becoming preheated, and consequently the passage of the gases upward through the gasifier assumes a higher velocity, so that complete combustion ensues at a greater altitude, and *vice versa*.

At Dover the secondary air is furnished through the duct visible in figs. 1 and 2 by a separate 5-h.p. motor-driven fan on an overhead platform, but a more recent design incorporates the fan in the pulveriser (thus dispensing with one motor), the motor for driving the whole set being located above instead of below the floor as at Dover.

The combustion process also is novel. The tangential injection of the fuel and air causes a whirling motion, and the finely-powdered coal, igniting immediately, moves towards the centre of the vortex and escapes upward readily; the larger particles, however, are forced to revolve at the periphery of the chamber until such time as they become gasified (hence the term "gyro gasification"), when the action of centrifugal force diminishes and the products of combustion escape over the lip of the chamber. It is thus apparent that the Lindley Duffield method of firing pulverised coal is similar to the manner in which a Bunsen burner combines gas and air preparatory to complete combustion at the top of, and exterior to, the mixing chamber. Thus the brickwork escapes that high temperature which obtains in large combustion chambers, and is characteristic of a soaking pit.

It will be appreciated also that the circulation of the larger particles of fuel during the gasification period on the outside of the vortex ensures the hottest area being inside, away from the combustion chamber walls; moreover, slag is deliberately allowed to deposit on the walls to form a constantly renewed protective coating, and it is fortunate that Leolite bricks are slag resisting to a marked degree. The bulk of the fused ash content of the fuel is thrown out of the flame vortex by centrifugal force and adheres to the brickwork; fig. 4 shows the appearance of the chamber wall around the fuel inlet pipe. A few hours after starting a new gasifier, a lining is thus formed from 2 to 3 in. thick, beyond which it does not grow, for thenceforward the surface is maintained at a temperature that keeps it viscid, so that the surface layer flows down gradually under the influence of gravity, assisted by the whirling action of the gases, into the ash hopper. In falling, it meets the

Fig 4.—Interior View of Gasifier.

uprising secondary air which is admitted at the bottom, whereupon it is aerated and reaches the bottom in the form of friable honeycomb-like clinker, which resembles pumice stone, containing not more than 1 per cent. of carbon. The secondary air thus cools the ash, at the same time preheating itself, employing the sensible heat in the ash, which otherwise (apart from its loss) might cause the ash to remain in a fluid state, a condition most difficult to deal with. This has been proved on very light loads (5,000 lb. evaporation per hour).

The boiler has a separate smoke stack to itself, and is provided with a 5-h.p. motor-driven induced-draught fan on the Prat system; no real smoke is emitted, although a Parker centrifugal grit catcher, made by the Tipton Tub & Tube Co., Ltd., is being installed.

The high-velocity injection of fuel is a departure from existing practice, and its mixing, gasification, ignition, and combustion occur in progressive stages of completeness. The combustion zone being controllable as to locality, the maximum heat thereof can be applied at the point of service, while another characteristic of the "gyro gasifier" is its occupation of the full area of the boiler setting; unobstructed by combustion arches, its radiant heat is thus directly applied just below the boiler tubes and prevents "nesting" between them.

The efficiency of combustion attainable with this plant is indicated by Table I, which gives the results of an eight-hours' test, and it should be emphasised that the 83 per cent. thermal efficiency recorded was reached with the boiler drum unlagged. Satisfactory as these figures are, Mr. R. C. Harpur, chief electrical engineer to the Dover Corporation, and Mr. C. S. Grieff, his station superintendent, assured us on the occasion of our visit of inspection that even better conditions have since been attained, notwithstanding the fact that the new boiler is not yet operating at its full steam pressure. The possibility of successfully utilising very low-grade fuels has not been overlooked; indeed, at Dover, Chislet coal (originally of 12,000 B.th.u. and has on more than one occasion been on fire in the bunkers) of a calorific value of 6,930 B.th.u. per lb., containing 22.78 per cent. ash and 1.1 per cent. moisture, has given satisfaction.

TABLE I.—BOILER TEST.

Guaranteed Conditions.

Heating surface, boiler	5,060 sq. ft.
superheater ...	870 sq. ft.
economiser ...	3,000 sq. ft.
*Steam, pressure (gauge) ...	200 lb. per sq. in.
temperature (final)	548 deg. F.
superheat	160 deg. F.
Water temperature, economiser feed	120 deg. F.
Water temperature, boiler feed	240-260 deg. F.
Evaporation, actual	30,000 lb. per hour
from and at 212 deg. F.	37,000 lb. per hour
Fuel, calorific value	11,500 B.th.u. per lb.
ash content	15-20 per cent.
moisture	5 per cent.
Thermal efficiency (guaranteed)	80 per cent.

Summary of Observed Figures.

*Steam, pressure (average, gauge)	161.1 lb. per sq. in.
temperature (average, final)	547 deg. F.
Water temperature, economiser feed	113 deg. F.
Water temperature, boiler feed	255 deg. F.
Evaporation, total water	119,100 lb.
total per hour ...	14,887 lb.
equivalent per hour	18,610 lb.
Air draught, at furnace	0.109
at boiler exit ...	0.186
at economiser exit	0.208
Furnace temperature, max. observed	2,462 deg. F.
Gas temperature, at superheater	932 deg. F.
at boiler exit	429 deg. F.
at economiser exit ...	318 deg. F.
CO_2, mean	9.83 per cent.
Fuel (prox. analysis), volatile matter	20.79 per cent.
coke	75.84 per cent.
ash	15.38 per cent.
fixed carbon	60.46 per cent.
moisture (free)	0.78 per cent.
moisture (hygroscopic) ...	2.59 per cent.
calorific value (as received)	12,314 B.th.u. per lb.
calorific value (lower) ...	11,450 B.th.u. per lb.
Deductions: fuel (lower calorific value)	11,450 B.th.u. per lb.
evaporative power of fuel	11.82 lb.
thermal efficiency ...	9.81/11.82×100=83 per cent.

*Note.—Steam is required at 160 lb. pressure only at present.

Colliery Power Stations.

The Layout of Generating Plant.

By A. LANGLEY.

The development of generating plant in old mines, or its installation in new ones, requires very careful consideration by the engineer as to the type of plant to be used to effect an economic operating cost under ordinary working conditions. The power required for winding, haulage, compressing air, and ventilating fans, as well as for coal-screening plant, washeries, workshop lighting and power has all to be considered in the scheme to give the best working results as an independent power plant and to compete favourably against a scheme of purchased power.

It is proposed to describe the development and utilisation in an old mine of existing plant for the generation of electrical energy, and the necessary lay-out arrangements to result in the minimum operating costs.

In this case the boiler plant is of the ordinary Lancashire type, arranged with superheaters, economisers, a feed heater, and a filter, installed by many colliery owners, and the fuel used has a calorific value as low as 9,000 to 10,000 B.th.u. Under these conditions it is possible to obtain an equivalent evaporation of 7 pounds of water per pound of fuel, with an ash content of 20 per cent. and a moisture content of 7 per cent., the average steam pressure being 110 lb. per sq. in. The annual electrical consumption is in the region of 4 to 5 million kWh.

Mixed-pressure turbo-alternators are installed working almost exclusively upon low-pressure steam exhausted from the steam winders, steam-driven fans, and from the steam-driven half of the compressed-air plant; the other half is electrically driven. The air plant, screening plant and washeries, the workshop power and lighting, and the underground haulages are all provided for electrically.

With the power station equipped with two turbo-alternators, a good arrangement provides for the sets to be on load alternately, acting as stand-by to each other, and supplying the system with energy at a power factor of 80 per cent., with a 70 per cent. load factor. Steam is received at 3 to 4 lb. per sq. in. above atmosphere, and exhausts to a vacuum of 27½ in., the temperature of the cooling water being 75 deg. F. The machines are directly-coupled and have a l.p. steam consumption of 31.7 lb. per kWh. The condensing plant, with motor-driven extractor pumps, is capable of dealing with 34,000 lb. of steam per hour and 1,990 gallons of cooling water per min. The circulation pump works under a 78-ft. head, and the capacity of the air pump is 60 lb. of dry air per hour. The cooling tower has a capacity of 1,500,000 gal. per hour.

The alternator cooling equipment is capable of dealing with 5,000 cu. ft. of air per min. The main switchboard in the power station is of the cubicle type, and consists of a voltage regulator, alternator, interconnector, and feeder panels, and the necessary synchronising and regulating equipment.

With this arrangement of plant, the development of which was taken up after most careful consideration, it was possible to bring down the operating cost per kWh to 0.26d., and a further reduction might be possible with further development of the boiler plant. This compares favourably with the supply company's costs, and points to the use of individual plant.

In the event of extensive developments in the future, the engineer would be faced with a problem requiring the most careful consideration on his part. Should electric winders be installed, and the compressing plant and ventilating fans be electrified, so as to take energy from the supply company, the initial cost of the developments would have to be borne in mind. The depreciation and interest upon the extra capital expenditure, and the question whether the supply company would give the consumer such a low rate that the debt incurred by complete electrification would more than balance the money spent on it, would also warrant consideration.

Testing Porcelain Insulators under Artificial Rain.

By R. T. FLEMING, A.M.I.E.E.

The development of outdoor sub-stations and extensions in transmission lines, &c., have necessitated developments in the design of protective weatherproof insulation for switchgear, transformers, &c. The class of insulation which is adopted is in almost every case porcelain, and with the ever-increasing pressures, larger and larger insulators have had to be designed and manufactured, and during the course of this development, it has been necessary to carry out all manner of tests, both on materials and designs. Porcelain insulator manufacturers have had to carry out tests on the insulators themselves, and further investigational work has become necessary when these insulators are fitted to the various pieces of apparatus with which they have to operate. Testing equipment to carry out this class of work is both bulky and expensive, and in many cases limited space has precluded a satisfactory layout for this class of work.

In this article it is proposed to deal with only one group of tests, namely, "Tests under Artificial Rain." The High Tension Laboratory of Metropolitan-Vickers Electrical Co.'s Research Department is fully equipped for carrying out all such tests.

In fig. 1 a floor plan of the test area is shown; the floor is made of concrete, and the particular portion which is used for rain testing is surrounded by a gully 3 in. broad by 6 in. deep. The entire floor slopes towards this gully, thereby being efficiently drained during testing operations. The rain spray consists of a 1½ in. diameter steel bar, 108 in. long, on a cast bedplate, supporting an arm holding the spray nozzles, fig. 2. The nozzles are known as Drake & Fletcher "Mistifier Jnr." nozzles, and were originally designed for the purpose of spraying fruit trees. This type of nozzle is specially suited to artificial rain testing, as it is capable of adjustment, thus any form of rainfall, from a fine mist to a heavy downpour, may be imitated. Adjustments on one nozzle give a range from a well-diffused fine spray 2 to 3 ft. wide close up to the nozzle, up to a long powerful drenching spray 20 ft. high. An illustration of this nozzle is shown in fig. 3. Eight nozzles are placed on the movable arm of the sprayer, and are so arranged that a large area can be covered with a uniform spray at one time. The extreme nozzles are controlled by valves thus, 8, 7 or 6 can be used at one time as desired; if it is found necessary to use less than this, the nozzles can be easily blanked out. The two cross arms are movable, thus giving facilities for covering any particular area, and the whole arm can be set at any desired angle. This last feature is necessary for studying the effect of the angle of inclination of the rainfall and for complying with specification tests, most of which call for rain falling at an angle of 45 deg. to the vertical. The nozzles are connected by flexible tubing to a special water tank, fig. 4.

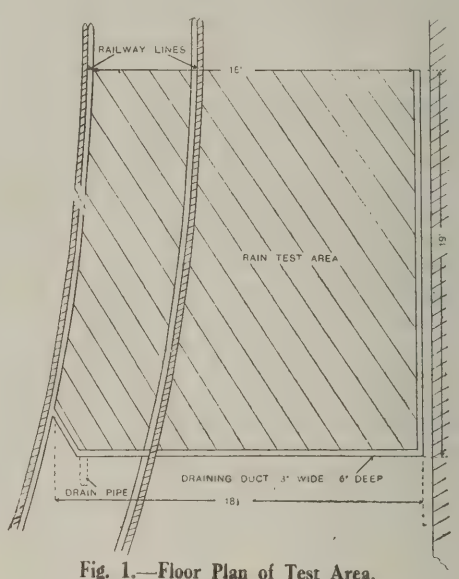

Fig. 1.—Floor Plan of Test Area.

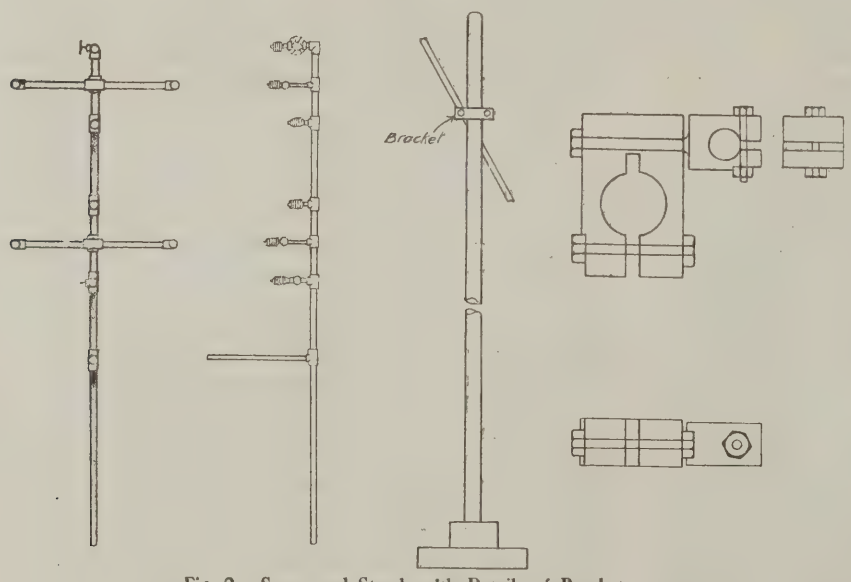

Fig. 2.—Spray and Stand, with Details of Bracket.

It is essential to use water from a container over which one has control, as on many occasions it is necessary to vary the rate of precipitation and the electrical resistivity of the water. The use of water, therefore, straight from a main pipe line is inadequate. The container is a welded tank made of mild steel with interior stays through the ends, constructed to operate at an air pressure of 60 lb. per sq. in., and tested up to 170 lb. per sq. in. The interior of the tank is painted to preserve the metal and reduce contamination of the water to a minimum. The tank is fitted with a water gauge, a pressure gauge up to 100 lb. per sq. in., compressed air and water inlet and outlet valves, sampling taps, and a valve for liberating the air pressure.

The advisability of operating this tank by compressed air is twofold; in the first case it is more convenient to locate it at floor level on account of accessibility, and secondly, variation in air pressure is the easiest method of controlling the rates of rain precipitation. In the case of this laboratory, connections are made to the factory compressed air supply, thus avoiding the neces-

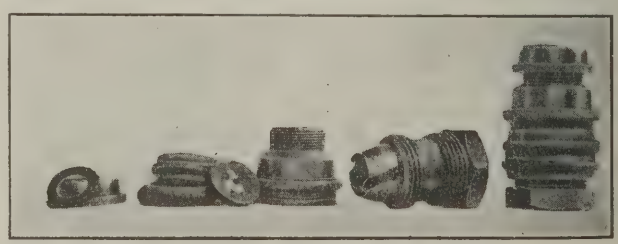

Fig. 3.—Parts of Spray Nozzle.

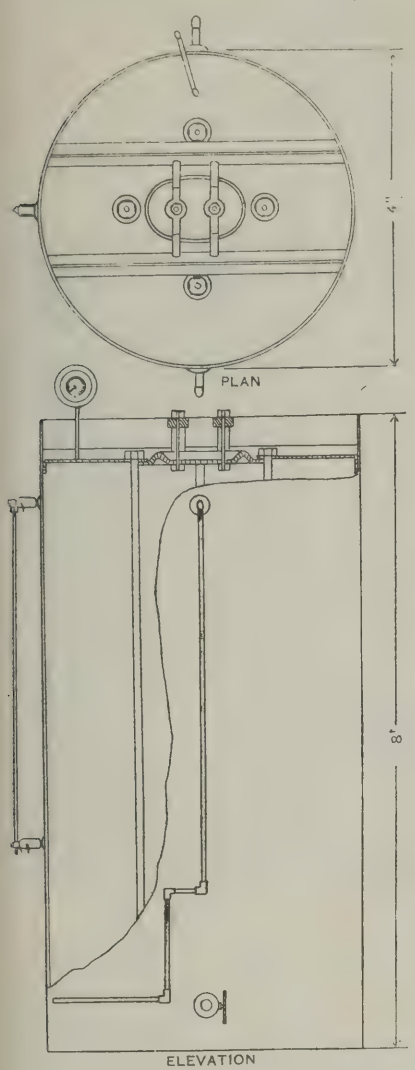
sity of the installation of a special compressor. A cover at the top of the tank can be removed with ease, enabling the addition of salt solutions, &c., to be carried out. In addition to the equipment already mentioned,



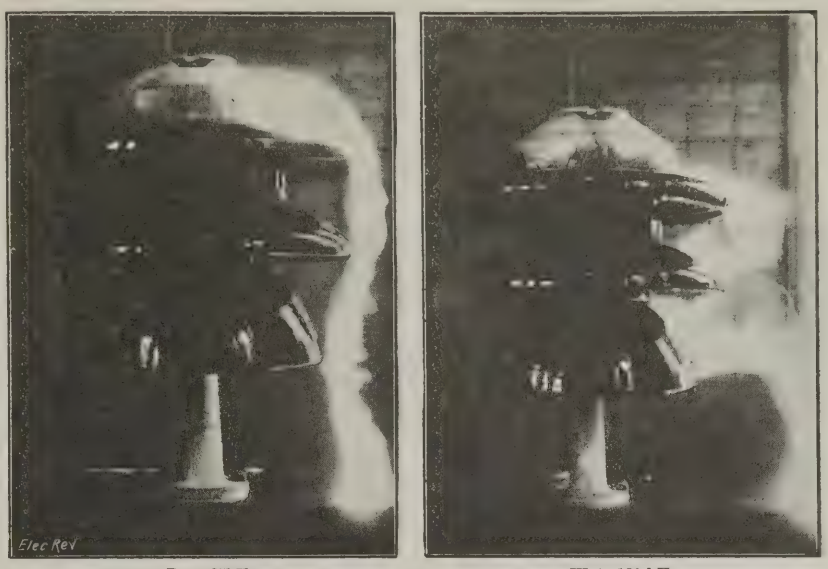


Fig. 4.—Pressure Water Tank.

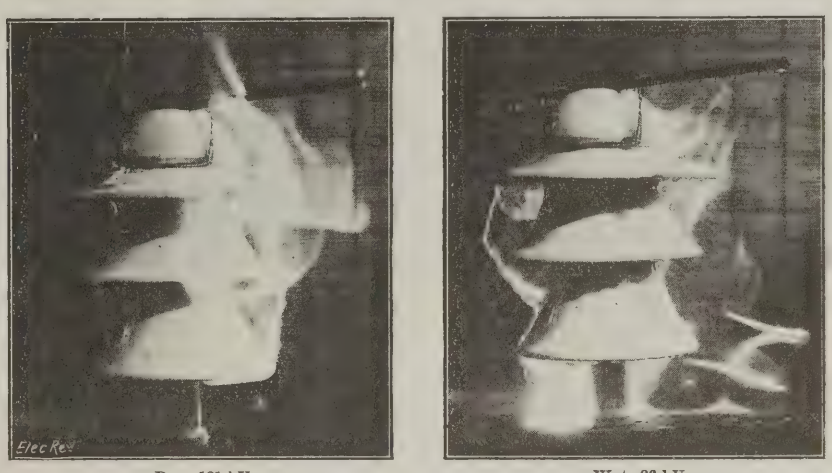

apparatus is kept for the measurement of rate of rainfall and specific resistance of the water. The former is a standard burnished copper rain gauge which does not require any further explanation, and the latter a "Dionic" water tester, fig. 7. This water tester is manufactured by Messrs. Evershed and Vignoles.* This piece of apparatus is eminently suitable for this class of work, as a measurement can be made in a moment, and even a series of readings during one test. Further, it can be used by an unskilled person; the time saved by this method as compared with laborious bridge methods is invaluable.

Tests of the above nature usually group themselves into one or two main classes: duration, and instantaneous spark-over (S.O.) tests. In the former tests, great care has to be taken to maintain a steady rainfall; this operation is greatly facilitated by the pressure control of the rain tank. The method of test is so well known that it does not require any explanation. The following illustrations show spark-overs taking place on various forms of insulators. The photographs reproduced in fig. 5 show a flow-line type of insulator, usually known as a Faradoid insulator; a comparison between the discharge on this insulator and that shown in fig. 6, a delta type, is worthy of notice. The latter insulator when tested dry shows marked corona discharge round the wire band, and also slight brush discharge on the

Dry, 185kV. Wet, 131 kV.

Fig. 5.—Discharge over Faradoid Insulator.

Dry, 121 kV. Wet, 96 kV.

Fig. 6.—Discharge over Delta Insulator.

uppermost shed; this discharge cannot be observed in the flow-line insulator. The relative positions of the metal pins in the two insulators with regard to the top of the porcelain may account to some extent for this difference. In the case of the delta insulator, the pin penetrates in the interior well up into the domed top, whereas in the flow-line type the end of the pin is approximately in line with the bottom of the top shed. The action of the delta type insulator thus makes it

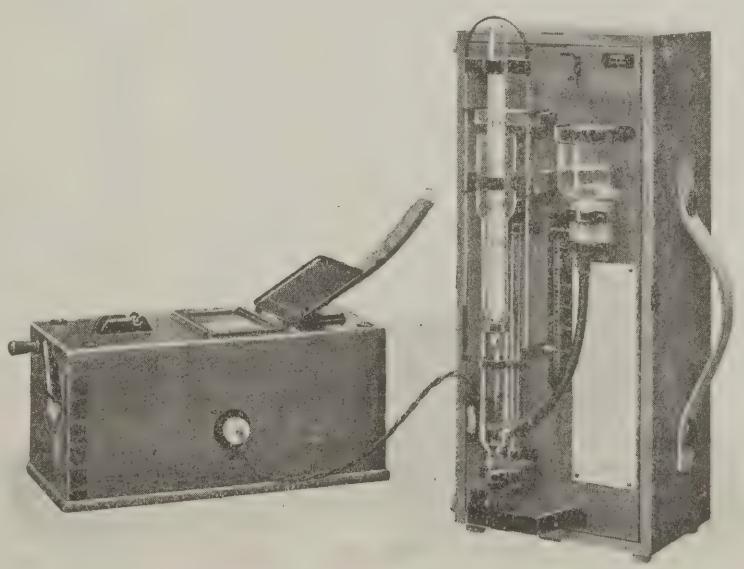

Fig. 7.—Dionic Water Tester.

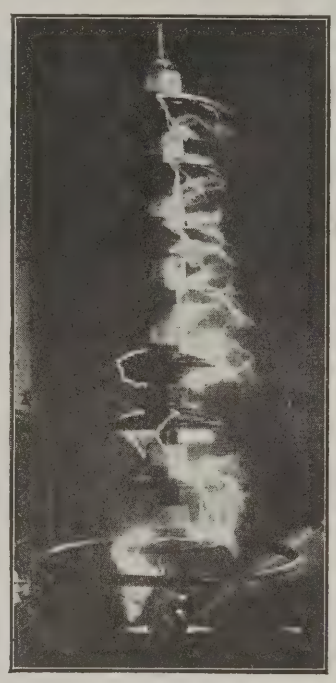
*See "The Digby & Biggs Dionic Water Tester," by E. Evershed, M.I.E.E.



more liable to form creeping sparks and brush discharge. The difference of the path of the arc of the two insulators is also a characteristic feature; in the flow-line insulator the electrostatic field is spread, and there is no tendency to come in between the sheds, whereas in the delta insulator the field around the pin is more concentrated, and tends to draw the arc in. A careful study of the photographs of the delta insulator under rain will show this tendency in as much as the rain drops are being attracted inwards on the middle shed.

Figs. 8, 9 and 10 show three different types of suspension insulators. In fig. 8 the straight line

Dry, 355 kV. Wet, 163 kV.

Fig. 9.—Discharge over Double-cap Insulators with Arcing Ring.

slightly to the right of the spark is merely the high-tension lead to the far end of the conductor, and has nothing whatever to do with the spark-over. In looking at the three sets of photographs, the absence of discharge in the dry test on the cap and pin type and interlink types should be compared with the heavy discharge shown on the double-cap insulators. The distance

Dry, 250 kV. Wet, 355 kV.

Fig. 10.—Inter-link Type Insulators Sparking Over.

Dry, 370 kV. Wet, 285 kV.

Fig. 11.—Outdoor Isolating Switch Pedestal Insulators Flashing Over.

between the porcelain pieces in this type and the higher percentage of metal per string of insulators is all conducive to this feature, which is clearly shown in the actual spark-over; where the former types have a clean spark-over, the insulators and the latter form a cascade spark. When tested under rain, this difference is diminished, due to the reduction of the variation in gradient, and all the types give a more or less similar type of spark-over. Fig. 11 shows a rigid pedestal type insulator which is used as a support for various types of equipment such as isolating switches, &c.; the units of this post are the Jeffry Dewitt type.

The variation in different specifications is sometimes confusing; one or other always being employed on various contracts, depending upon the preference of the consulting engineer and client. A few details from them may be of use.

The following notes are extracted from the more important specifications:—

British Standard Specification for Porcelain Insulators for Overhead Power Lines (3,000-150,000 volts). No. 137—1922.

Dry Spark-over Test; Clause 10.—The insulator, complete with metal fittings, shall be tested when dry as follows:—A wire of 0.4 in. diameter shall be fixed to the insulator in a manner similar to that adopted in service. An alternating voltage, of any frequency from 25 to 100 periods per second, approximately of sine wave form, shall be applied between the wire and pin or other support of the insulator. The test voltage shall be measured by means of either a suitable instrument connected to the high voltage side of the transformer, or a suitable instrument connected to the low voltage side of the transformer supplying the test voltage and calibrated by means of the sphere spark gap specified in Appendix II. The test shall be commenced at a voltage of about one-third the full test voltage, and shall be increased at the rate of approximately one kilovolt per second until spark-over occurs. The voltage at which spark-over occurs shall be not less than the appropriate value in Table I.

Rain Test; Clause 11.—The insulator shall be tested in accordance with Clause 10, except that it shall be

subjected to an artificial rain at a temperature of about 15 deg. C., equivalent to one inch in five minutes (5 mm. per minute) directed at an angle of about 45 deg. from the vertical during the test.

The resistance of the water at 15 deg. C. shall not be more than 20,000 ohms per centimetre cube.

Kilovolts.

NOTE 1.—The term "delivered voltage" denotes the normal voltage between the conductors at the delivery end. For the purpose of this specification, the working voltage is assumed not to exceed the delivered voltage by more than 10 per cent.

NOTE 2.—Test voltages for special insulators required for intermediate voltages may be ascertained from a curve prepared from the above figures.

* These four voltages are not included in B.S.S. No. 77 Standard Pressures for New Systems and Installations.

The voltage at which sparkover occurs shall not be less than the appropriate value given in Table 1.

(To be concluded.)

The Status of the Professional Engineer.

By FREDERICK MURGATROYD.

ONE has become so accustomed to expect nothing other than technical papers to be printed in the *Journal* of the Institution of Electrical Engineers, that the appearance of the recent paper by Mr. Carter on "The Engineer: His Due and his Duty in Life," must have seemed to many of us remarkable. Our second feeling would be one of pleasure in the thought that things which have been the subject of our meditation are at last being talked of in the halls of the mighty. For giving tongue to our thoughts, Mr. Carter has earned the gratitude of all engineers who love their calling and wish it to take that place in the sun which is its right heritage.

Anyone intimate with the thoughts of modern engineers, and especially those who, for no reason of snobbery, look upon engineering as a major profession, must have become aware of an undercurrent of dissatisfaction, in many ways strange. Strange, because whilst most dissatisfaction springs from purely selfish motives, this new dissatisfaction could not be wholly explained in terms of material gain. It is, therefore, all to the good that the question has now been officially debated, and above all it is essential that the flame lit at the Institution meetings shall not be left to die, but shall be held aloft and retrimmed at every opportunity.

* * * * *

What then is the nature of this dissatisfaction? In the first place, the professional engineer does not feel he is getting a square deal from those who benefit as a result of his work. It is a truism that the engineer blazes the trail of civilization, and that materially the measure of our remoteness from the cave-man is the measure of the contribution of engineering to life. This is really no extravagant claim. Our buildings, our roads, our travel, our means of production and distribution, are all the product of engineering activity. Despite this, the engineering profession is a profession of poor men. The engineer does not ask for a fortune—otherwise he would have been a trader. But he does expect a reasonable financial payment, and in the past he has not had it.

It is this desire for recognition that brings us to the second and far deeper reason for dissatisfaction. The progress of engineering has recently been so rapid, and has embraced the higher realms of scientific work to such an extent, that a new type of entrant has increasingly been drawn into the engineering profession. Especially is this so of electrical engineering. It was not so many years ago that the university graduate was given only benevolent toleration in our ranks. To-day, university training is becoming as essential to success as it is in the sphere of medicine or law. Yet the university graduate in engineering finds that in after life there are no opportunities of leadership or high administrative positions such as seem to fall naturally to his legal or classical brother. Such a state of affairs cannot continue, because engineering is attracting some of the wisest and most enlightened men of our time, men, moreover, who, through their scientific training and inside knowledge of industry, are all the more capable of wise judgment on the many social and national problems to be solved.

That, in brief, explains the nature of the growing dissatisfaction in the profession of engineering. It is the desire of earnest men, who have contributed so much to the public weal, for due recognition from their direct employers and from the nation which benefits.

* * * * *

One or two observations should, however, be made. There is a lot in a name. There is much more in the associations that cling to a name. And, however sweet the word "engineer" may sound to our ears, it conveys nothing more than overalls and oily waste to most laymen. To use the name "professional engineer" is a poor compromise. What is wanted quickly is a *new* name for the well-qualified man, and an authority with legal power to see that only those of specified qualifications shall be allowed to use the name. Moreover, entrance to the profession should be by a suitable ceremony conducted by the authority, just as a priest-elect takes Holy Orders, or a barrister-elect is called to the Bar. All this may seem fantastic to some—there are some people to whom all new ideas are absurd—but, it is only by such a creation of atmosphere that we can win recognition from the world at large.

Finally, in claiming our right to leadership and to administrative posts, we must be sure that we are truly qualified to rule. It is easy to throw gibes at the men who followed classics and law, and have succeeded to places of power. Many of them make good administrators indeed, but no one would put that solely to the credit of their classical or legal training. If they are good administrators, they must have been receptive to many other influences. Thus, no engineer will ever be a good administrator unless he can think clearly, and is able to speak and write his own language correctly and with clarity. He must know something of economics, of history (especially industrial history), and of psychology. Surmounting all, there is the man's personality. No man is a true leader whose main impulse is selfishness. The natural leader is in rhythm with the universal law of service, by which an understanding of life and its problems, approaching the mystical, is attained. He raises himself beyond self, and works in synchronism with nature towards the goal of a more perfect life. The others follow.

It would be one of the highest duties of the authority proposed, to seek among educated men, sharpened in the engineering atmosphere, the few who possess innately the gift of leadership, which is the gift of true service, and to make sure that the qualities of such men are used to the benefit of the nation.

Electric Steel in Mexico.—It is reported from Mexico City that the local firm of Hierrey Acero de Mexico has entered into a contract with representatives of the Siemens and Halske Company of Berlin, for the construction of a modern iron and steel works plant. The smelting furnaces and machinery will be obtained from Germany. It is stated that the question concerns the practical application of the production of steel by means of "electro analysis" on a large scale, such as was shown by the Berlin firm for the first time at the recent Leipzig Fair.

The Electricity (Supply) Bill.

By Sir PHILIP DAWSON, M.P.

The progress of the electricity supply industry in Great Britain has been hindered and retarded by parochial legislation and hampering restrictions. The need for encouraging the industry and its vital importance to the general welfare of the country were clearly and fully brought out in the reports of the Coal Conservation Sub-Committee, of the Committee appointed by the Board of Trade on Electric Power Supply, and of the Archibald Williamson Committee. These Committees comprised representatives of all those interested in the development of electricity supply and distribution and utilisation, and the most exhaustive investigation of the whole subject was made, evidence from all quarters being heard.

The conclusions as to the need for legislation and as to what the requirements were to render available a more abundant, universal, and cheap supply of electricity were clearly laid down, and on the latter point all three Committees were unanimous. The result of these investigations was the 1919 Electricity (Supply) Act, which created the Electricity Commissioners, but gave them no real power.

To some extent this unsatisfactory state of affairs was remedied by the 1922 Act, but the compulsory powers which were essential to enable the fundamental conditions laid down by all three Committees referred to above, to be complied with were still omitted.

Successive Governments have talked about electricity without doing anything to render the use of it more generally possible. The present Government appointed the Weir Committee, whose report has just been published, on which the present Electricity Bill is based.

This Committee had not only the evidence of the investigations of its predecessors before it, but also the results of the exhaustive examination of the conditions obtaining in the supply industry in this country, carried out by the Electricity Commissioners during the last six years. In addition, they took evidence themselves to ascertain how far the present conditions justified the conclusions arrived at by the previous Committees, and obtained outside expert assistance to check the estimates prepared for them by the Electricity Commissioners.

No one who knows the facts can deny that this country, through no fault of its industry or its spirit of enterprise, but in consequence of the hampering restrictions imposed upon it, is behind all other industrial countries of the world as regards the use of electricity for all purposes.

The country realises this, and all political parties have called attention to it; the question is: What is the remedy? It is here that the difficulty arises. Some say "Leave us alone and do nothing." "Wait and see." Others say "Reintroduce the powers given to the Electricity Commissioners in the 1919 Bill, and cut out by the House of Lords."

The present Bill, based as it is on the recommendations of the Weir Report, proposes an alternative which those who framed it believe will bring about the desired result.

The first course is one which can only commend itself to vested interests, and which in a few years' time might make real combination and co-operation practically impossible, conditions which all agree to be essential.

The second is tantamount to nationalisation. The third is wisely conceived, and should achieve its object without nationalising the industry. It must not be lost sight of that the electric supply and distribution industry is a public utility, and that it must of necessity be a monopoly. It is essential, therefore, that the consumers' interests should be reasonably protected, and it is the duty of the State to see to this. So far, in nearly all the discussions which have taken place, the voice of the supply industry has been predominant, and little or nothing has been heard about the consumer.

The Government Bill has received a second reading, and it now remains during the Committee stage to try and amend the clauses, where necessary, so as to provide that:

(1) The Board which is to be set up is composed of the best business talent the country possesses and of men commanding the respect of all, who shall be entirely independent of any political or bureaucratic control, any conflict as regards decisions they may arrive at being settled by an impartial judicial tribunal.

(2) The rights of those who have invested money in the electricity supply industry be not interfered with.

(3) Private enterprise be encouraged by all possible means, and that whilst the consumer is properly protected, there shall be an inducement to the producer to improve the methods of generation and distribution by enabling him to participate in the financial benefits resulting therefrom.

(4) The Board be given any compulsory powers they may need to carry overhead transmission lines across country and to generally facilitate the spread of electrical enterprise.

Some Points in the Bill that need Elucidation.

By "OHM."

The discussions in Parliament and in the Press have helped to clear the air to some extent and define the attitude of those who are interested in the fortunes of the Electricity (Supply) Bill, 1926.

Many of the points raised will shortly be dealt with by a Standing Committee of the House of Commons, and for the present, at any rate, need not be further discussed, but there are certain arguments which have been made in favour of the Bill which do not appear to be well founded and call for consideration.

It is stated that the bankruptcy of the truncated electricity supply legislation of 1919 has been betrayed through statistics alone, because the percentage increase in the output of electricity in the previous year has decreased during the four years ended March 31st, 1926, and will fall to zero in about four years, when the consumption per head of population supplied by authorised undertakers will stand at about 210 units, as compared with the present consumption of 560 units for the United States.

In considering this assertion, the question may be asked why the decrease will not continue with ever-increasing rapidity until there is no output at all? The real answer to the assertion, however, appears to be that the decreasing percentage is due to the slump which followed the war, from which the country has not yet recovered. Happy electrical manufacturers! who have been too busy to notice this and in their haste have been unconsciously led to a wrong conclusion.

Monotony is usually one of the banes of existence, but the chairmen of electricity committees, of power companies, of distribution companies, and even of electrical manufacturing companies, have during these difficult years spoken of the progress which has been made in the supply of electricity, or the manufacture of electrical plant, and expressed their conviction that once trade had recovered there would be unprecedented advances.

It is not the object of this article to discuss the respective merits or demerits of joint electricity authorities formed under compulsion or by consent, but it

may be stated that there is still a good proportion of people in this country who do not believe that the best results are obtained by compulsion or by the brandishing of a big stick. In confirmation of this it is becoming increasingly clear that the opposition to the Bill will centre round those clauses where the provisions are compulsory or where there is no right of independent reference.

The amount of Central Electricity Stock which will ultimately be issued is not very clear. On the one hand it is stated that the £33,500,000 will be reached at a maximum period of development, and according to the Weir Report this should take place about 1940.

There does not appear to be any justification for this statement. It is true that the Bill fixes the sum mentioned as the amount to be issued, but there is no assurance anywhere in the Bill that this amount will not be increased.

On the other hand, it is stated in the Weir Report (paragraph 79) that "The technical scheme will, we think, involve during the next 15 years new money to the extent of upwards of £250,000,000. We estimate that one half of this will be required in connection with the development of distribution schemes, and this capital should be provided by the local authorities, power or distribution companies as now."

This should be read in conjunction with paragraph 81, which states that the other half of the new capital can be divided into two sections, one being "the amount necessary to construct the 'gridiron' for bulk transmission, plus (1) the necessary working capital; (2) sufficient reserve to cover the initial expenses of management; and (3) interest capitalised. . . . We estimate that a sum of £25,000,000 *would be absorbed in the foregoing by the end of five years from the date the scheme is put into operation.*"

If it is correct that the total will be reached at a maximum period of development, does the Weir Report mean that the scheme will not be put into operation until 1935—that is, five years before the 1940 to which reference has so often been made?—inaccurately made, because the Weir Report forecasts the millennium of electricity supply "in 1940 *or when the consumption has reached* 500 *units per head.*"

Those who are familiar with the matter will be aware that the difference between the £33,500,000 and the £25,000,000 above referred to is the estimated cost of the standardisation of frequency. During the debate on the second reading, much doubt was expressed whether this difference was sufficient, but as Kipling says—that is another story.

When will the consumption of 500 units per head of population be reached? Advocates for the Bill point to the output of the United States as the goal towards which this country should strive, but say little of the different conditions which prevail.

To consider the respective advantages of a national or local authority or power company supply, would lead to an article of inordinate length and serve no useful purpose, but it was stated in the House on Tuesday, March 30th, that 97 per cent. of the electricity generated in the United States was generated by private companies and only 3 per cent. by municipal undertakings. Of course, this solution is not contemplated here. It has been stated that "the realisation of a similar co-ordination (that is, as in North Italy or the United States) in Britain, the possibility of establishing a number of power undertakings with centralised control is out of the question, since local authorities account for over 65 per cent. of the total output of electricity."

Nor has this solution been suggested by the power companies. What they have asked for and will continue to ask for is that the Bill shall be so amended that it will not, in the opinion of the many who believe in private enterprise, involve a breach of faith through the cancellation of existing statutory rights, and create such conditions of uncertainty as would prevent the free flow of the capital that is so necessary for efficient electrical development.

Their hope is that such amendments will be made as will give confidence to all engaged in the development of electricity supply, whether it be through the undertaking of a local authority or a company, and so change them from ohms to amperes charged with many volts all working for the common good.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Threatened Tramway Strike at Rochdale.—As we have previously reported, the employés of the Rochdale Corporation Tramways Department decided to cease work on Good Friday on account of the dismissal of two men for misconduct. The strike was postponed, and negotiations were opened between the men and the Tramways Committee. No agreement was reached, however, and the men were to call a meeting to decide upon the action to be taken.

Electrical Contracting Notes.—It is reported that the Gloucester Electricity Department is paying increased attention to the earthing of domestic electrical appliances such as irons, vacuum cleaners, fires, and so on. The local branch of the Electrical Contractors' Association is seeking a definite ruling on this matter. Owing to the approach of the City and Guilds examinations, E.C.A. branches are making arrangements to bring forward promising apprentices to compete for the E.C.A. gold, silver and bronze medals. At the last meeting of the Sheffield branch it was resolved to insert suitable advertisements in the local Press, emphasising the advantages of placing installation work in the hands of competent firms. Members of the Stoke-on-Trent branch have taken space at the electrical exhibition to be held in Burslem Town Hall during "Civic Week." The meetings of this branch are held in the offices of the Electricity Department, and the branch thereby maintains the closest possible touch with Mr. Yeaman, the chief electrical engineer, who is a regular visitor to the branch meetings.

Special Telephones Committee.—Sir Alexander Roger, chairman of the Telephone Development Association, has accepted an invitation to join the Special Committee for Telephones set up by the International Chamber of Commerce. The chairman is Dr. Walter Leaf, and the other representative of Great Britain is Mr. Frank Gill, past president of the Institution of Electrical Engineers.

Baghdad Electrical Concession.—Messrs. John Stone and Co., who hold the Baghdad electrical concession, have asked the Colonial Office for six months' grace to study the fresh proposals put forward by the Iraq Government.—*Exchange Telegraph* (Baghdad).

Local Exhibition.—MANCHESTER.—A Better Housing and Housekeeping Exhibition was opened on April 9th by Mrs. Councillor E. D. Simon, a member of the Council of the new Manchester branch of the Electrical Association for Women. Standard Telephones & Cables, Ltd., have a large display of domestic electrical appliances; Central Cables & Accessories, Ltd., shows its "Central" electric vacuum cleaner; "Delco-Light" and "Frigidaire" products are exhibited by Messrs. Frederick Jones & Co., Manchester; Messrs. E. O. Walker & Co., Manchester, exhibit "Thor" washing machines; and other exhibitors are the Excelsior Electric Cleaner Co., the Gem Labour-Saving Device Co., Ltd., and Hoover, Ltd.

Rubber Industry.—On Monday next, at the Engineers' Club, a meeting of members and friends of the Institution of Rubber Industry will be held to consider a proposal to form a Salesmen's and Advertising Section.

Belgian Customs Regulations.—Owing to the lapse, as from April 1st, of the special duties imposed on certain German goods on importation into Belgium, the list of goods in respect of which certificates of origin are required has been reduced, states the *Board of Trade Journal*. The following classes are, however, still subject to the requirement: Dynamo-electric machines; boiler fittings of various sorts; submarine and subterranean cables for electricity; articles for electrical purposes of faience, porcelain, terra-cotta, stoneware or glass with parts of metals or other materials; and electrical and electrotechnical apparatus and separate parts thereof, for the application of electricity in all forms (not elsewhere specified in the tariff).

City Electricity Charges. — The Special Committee appointed over a year ago by the Corporation of London to consider the cost of electricity in the City has issued a report. Dissatisfaction is expressed at the action of the Ministry of Transport in reducing the legal maximum charge from 8d. to 7d. per kWh, when a reduction of 3d. was anticipated. Mention is made of the Corporation's decision to abandon the right of purchase of the City undertaking of the Charing Cross Electricity Supply Co., Ltd., and that of the City of London Electric Lighting Co., Ltd., and also of the provision of a sliding scale of prices and dividends by the London Electricity Acts. The Committee states that the companies had issued notices setting out a scale of tariff charges to operate as from January 1st, 1926, and it had urged the companies to make the scale take effect from October 1st. The companies gave a number of reasons for their inability to comply with this request, among them being the poor load factor; the conditions in different areas, which made equality of prices impossible; and the fact that their dividends were not unreasonable when compared with those of other companies. It had been suggested to the Committee that the Corporation should either generate electricity for itself or seek an alternative source of supply, but neither of those courses is considered feasible. The Committee concludes its report as follows:—"In view of the very considerable profits which have been distributed by the two companies among their members during the last few years, we are of opinion that there is scope for a further reduction in the price of electricity in the City. Inasmuch, however, as future prices will be based upon a sliding scale in accordance with the recent Act, we do not feel able to make any specific recommendation on the subject until the working of the Act is tested by experience, and in the circumstances beg to recommend that the several references to us be discharged, but that it be referred to us to consider the question of the prices charged in the City when the full effect of the recent legislation is seen."

The Metropolitan-Vickers Carnival.—A carnival and cabaret were held by the staff of the Metropolitan-Vickers Electrical Co., Ltd., on Friday last, at the Free Trade Hall, Manchester. About 2,500 attended in a variety of brilliant costumes, and a number of gorgeous effects were produced by a special scheme of illumination. The cabaret comprised three scenas, Dutch, Parisian and Oriental, the last is depicted in the accompanying illustration. The judges had a very difficult task in awarding prizes for 14 costumes out of a total of over 2,000, but their success was testified to by the general approval. At 11 p.m. the B.B.C. broadcast the proceedings from the Manchester station for the benefit of the public and those employés who were unable to be present. The carnival both from the decorative and catering points of view was a triumph of organisation.

A Tableau at the Metropolitan-Vickers Carnival.

New Businesses.—The following new electrical businesses have been recently registered under the Business Names Act, 1916:—

Smith & Jordan (electrical and wireless engineers), 6, Millbank Terrace, Redcar.

London Radio Supply Co. (manufacturers of and dealers in radio apparatus), 11, Oat Lane, E.C.2.

A. Fraser (cycle and wireless factor), Eltham Market, High Street, Eltham, S.E.9.

Foleshill Wireless Distributing Co., 879, Foleshill Road, Coventry.

Alfred Williams & Son (electrical engineers), 21, Cannon Street, Preston.

Whibro Engineering Co. (electrical and mechanical engineers and contractors), 38, Guildford Park Road, Guildford.

Moorhouse & Co. (electrical, radio, and hardware manufacturers and importers of radio specialities), 101, Bradford Road, Shipley, Yorks.

Rationola Wireless Instrument Co., Hackney Downs Junction Approach, G.E.R., Hackney, E.8.

Telektron Co. (radio components), 14, Lacy Road, Putney, S.W.15.

Rock Electrical Engineering Co., 6, Rock Street, Oldham.

Lead.—Messrs. James Forster & Co. reported on April 10th:—"Though the price of lead may go a little lower yet, we consider that the worst of the fall has already been seen and that forward lead at present prices is well worth picking up by consumers."

Trade with Russia.—In reply to representations upon this subject made by the London Chamber of Commerce, the Foreign Office states that the Government has every sympathy with British investors who have had their properties confiscated under the Soviet law. It is thought that a growing sense of the economic needs of Russia may in time help the Soviet Government to realise that the development of trade depends upon credit and that Soviet credit cannot be established in the markets of the world until existing liabilities legally inherited are recognised and until an honest attempt is made to meet them. With regard to the sale in this country of products of confiscated factories, the Courts have held that where the Soviet Government can prove a good title according to Soviet law such title is valid here. The British Government does not consider that matters would be improved by abrogating the existing Trade Agreement with Russia.

The French Export Trade.—In the course of the report for 1925 of the Union des Syndicats de l'Electricité, it is mentioned that until recent months the exports of electrical manufactures have consistently increased in volume. Thus on the basis of the exports of 10,200 tons in 1913 the export surplus amounted to 2,600 tons; in 1921 the surplus with exports at 12,400 tons was 200 tons; in 1922, when the exports were 13,000 tons, the surplus was 4,600 tons; in 1923 the excess of exports over the imports was 7,800 tons, with exports of 16,700 tons; and in 1924 the exports reached 23,600 tons, giving a surplus of 15,200 tons over the imports. The report states that the share of France in the world's electrical trade has increased from 6 per cent. in 1913 to 11 per cent. in 1924. During the same period the share of Germany has diminished, the shares of England and Switzerland have scarcely increased, while that of the United States has grown by 50 per cent. In view of the present economic situation the French do not know whether the exports of electrical machinery will continue to progress in such a rapid manner, but the hope is expressed that having acquired an important place in foreign markets, French makers will know how to maintain their position.

Manufacturing in Belgium.—The report of the directors of the Compagnie des Constructions Electrique de Belgique, which deals with the period of eight months ended December 31st, 1925, states that during this time the works were idle for seven weeks owing to a strike, which caused a serious loss. Notwithstanding this strike and the industrial and economic crisis and the difficulties resulting from the arrangement of the Liége works, the results for the period show a profit of 109,139 fr. After having placed 5 per cent. to the legal reserve fund, the balance of 103,682 fr. has been carried forward. The capital has been reduced, and at the same time the raw materials have been written down and the machine tools and fixed plant at the works have been re-valued. As the works at Liége has been completed with a view to the production of small motors in bulk, the installation programme has now been finished; large and medium-sized machines are constructed at the Herstal works, while apparatus and small motors are being turned out at the Liége works.

Lift Contracts.—In the reconstruction of Regent Street, W., the Express Lift Co., Ltd. (proprietors, the General Electric Co., Ltd.), has installed over 100 lifts. Amongst other recent installations for which this firm has been responsible are: Bank of England Buildings (12); Midland Bank, Ltd., three branches (18); the new Park Lane Hotel (23); the New Royal Hotel, Southampton Row (15); Service Flats, Ltd. (77); Fullers, Ltd., Regent Street (16); Café Royal, Regent Street (8); New Carmelite House (5); *Daily News* (8); and Lewis's Stores, Birmingham (8).

Electrical Development in Rumania.—A conference was recently held at the Ministry of Industry in Bucharest to discuss the possibilities of electrifying Rumania; Swiss, French, and Italian experts are said to have been present. Foreign financiers manifest great interest in the matter, but it is stated that foreign capital will not be provided for works if the commercialising law and other laws, which greatly hamper foreign enterprise, are applied to electrical undertakings.

Unemployment.—The Employment Exchange returns for March 29th showed a total of 1,013,600 persons wholly unemployed. This represented a reduction of 25,754 during the week and the total was 180,713 less than that of March 30th, 1925.

Trade Announcements.—The address of the ELECTRICAL PUBLICITY BUREAU is now 36, Kingsway, W.C.2.

THE STEEL BAND CONVEYOR & ENGINEERING CO., LTD., has removed to Barker Street Works, Parade, Birmingham. A card illustrating a "record-breaking" "Sandvik" steel band (377 ft. long × 24 in. wide × 0.004 in. thick, and weighing 1,225 lb.) has been received.

MR. A. CLADWELL YOUNG, 120, Wellington Street, Glasgow, has by mutual arrangement severed his connection with Kent Brothers Electric Wire Co. and E. H. Phillips, Ltd. Another representative will be appointed shortly.

THE ALTON BATTERY CO., LTD., has appointed Messrs. Simpson, Baker & Co., 2-5, Nelson Street, Bristol, as its agents for South-West England and South Wales.

THE TELEGRAPH CONDENSER CO., LTD., has opened new works at Wales Farm Road, North Acton, W.3, to which address all communications and goods should be sent.

MESSRS. CLEGG, HIGHCOCK & CO.'s new address is:—8, Drury Lane, Water Street, Liverpool. Telephone: Bank 4000; telegrams: "Praebere."

Catalogues and Lists.—THE ZENITH MANUFACTURING CO., Villiers Road, Willesden Green, N.W.2.—An illustrated catalogue of regulating resistances, resistance units, and small transformers. Priced.

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, E.C.4.—April price sheet of electrical materials and apparatus. Fully illustrated.

NUCYNES, 35, Waterloo Road, S.E.1.—A booklet advertising the firm's signs.

Mr. W. S. JOHNSON, 42, George Street, Edinburgh.—A priced pamphlet illustrating a wireless electric iron, *i.e.*, one which is placed on an electrically-heated stand.

THE AUTOMATIC TELEPHONE MFG. CO., LTD., Milton Road, Edge Lane, Birmingham.—Booklet No. 71, and a coloured showcard, advertising the company's headphones and loudspeakers.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, nr. Manchester.—A poster measuring 30 in. by 20 in., produced by the photogravure process, showing motor traffic in Whitehall, the purpose being to advertise the company's automobile batteries.

ST. HELENS CABLE & RUBBER CO., LTD., Slough.—A comprehensive catalogue of the company's "C.T.S." cables and wires.

THE TOURTEL MANUFACTURING CO., 48, Uxbridge Road, Ealing, W.5.—A folder advertising the "Diamond" seal padlock.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—April list of motors and dynamos in stock.

THE ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, W.C.2.—Technical Guide No. 1,510a, containing information regarding small induction motors for driving textile machinery, &c.

Bankruptcy Proceedings.—F. J. TIZZARD and N. TIZZARD (Tizzard Bros.), electrical engineers and contractors, 27, Dalkeith Street, Barrow-in-Furness, and 121, Market Street, Dalton-in-Furness.—First and final dividend of 7¼d. in the £, payable at the Official Receiver's offices, 16, Cornwallis Street, Barrow-in-Furness.

W. C. RHODES (L. J. Palmer & Co.), electrical engineer and contractor, 141, Newspaper House, Corporation Street, Birmingham.—First and final dividend of 1s. 8d. in the £, payable at the Official Receiver's offices, 191, Corporation Street, Birmingham.

W. R. SQUIRE, electrical engineer, 11, Steward Street, Spring Hill, Birmingham.—First and final dividend of 2s. 1d. in the £, payable at the Official Receiver's offices, 191, Corporation Street, Birmingham.

W. G. BAYMAN, electrical engineer, 86, North Side, Wandsworth Common, S.W. (late of 13, Russell Street, Plymouth).—First and final dividend of 4d. in the £, payable at the Official Receiver's offices, 29, Russell Square, W.C.

REED & BURR, wireless manufacturers' agents, Radio Lodge, Hammersmith Terrace, W., and Red Lion House, Red Lion Court, Fleet Street, E.C.—Receiving order made April 1st on creditor's petition. First meeting April 16th; public examination April 27th, both at Carey Street, W.C.

J. C. HEALEY, electrical engineer, 4, Worsley Terrace, Wigan.—First meeting April 19th, at the offices of the Official Receiver, 11, Dale Street, Liverpool; public examination April 29th, at the Court House, Wigan.

A. F. KINGDOM, 86, Old Town Street, Plymouth, late of Devonport, electrical and radio engineer.—The public examination of this debtor was to be held on April 9th at Plymouth, but he did not appear, and the case was adjourned.

Company Liquidations.—PEERLESS PRODUCTIONS, LTD., Cowthorpe Road, Wandsworth Road, S.W., medical electrical apparatus manufacturers, &c.—A meeting of creditors was held recently at the Institute of Chartered Accountants, E.C., when the chair was occupied by the liquidator of the company and the receiver for the debenture holders, Mr. Sidney Sharpe, C.A. A statement of affairs was presented which showed liabilities of £2,350, and net assets of £800, which left a deficiency as regarded a debenture holder of £1,302. The liquidator said that there would be nothing for the unsecured creditors. The company was incorporated in August, 1925, with a nominal capital of £500. All the shares were issued of which 168 were paid for in cash. On August 20th, 1925, it was resolved to issue debentures and accordingly £1,000 debentures were allotted to Mr. D. J. Phillips (the chairman of the company), and cash for that amount was received. A further £1,000 debentures were issued to the same gentleman in October, 1925. On January 28th, 1926, owing to bad trade, three of the directors resigned and Mr. R. J. Phillips was appointed a director. Since that time the directors had been Mr. D. J. Phillips and Mr. R. J. Phillips, and all the shares were transferred to them. It was apparent from the accounts that the company had not done sufficient trade, and the overhead expenses were far too high. On March 15th, 1926, the company being pressed and a writ having been issued, a resolution was passed for voluntary winding up and on the same date the debenture holder appointed Mr. Sharpe as receiver. A committee of three of the creditors was appointed to act with Mr. Sharpe as liquidator. The following are creditors:—

	£		£
Aston & Mander (1917), Ltd.	25	Telegraph Condenser Co.,Ltd.	33
Erinoid, Ltd.	205	Thornton & Co.	32
Harrison Bros.	31	Vernon, J. G., & Co., Ltd.	52
Hyatt, J., & Co., Ltd.	36	St. Helens Cable & Rubber Co., Ltd.	25
Murphy, F. C., & Co., Ltd.	20	South London Electric Co.	188
Plumtree, J. S.	20	South Metropolitan Gas Co.	72
Smiths Printing Co.	33		
Spicers, Ltd.	54		

R. R. GODING, LTD., radio dealers, &c., 42, Gray's Inn Road, W.C.—A meeting of creditors was held on April 8th, when the chair was occupied by Mr. E. B. Winn, accountant, who stated that he had been appointed to act as the liquidator in the voluntary liquidation of the company. A statement of affairs was presented which disclosed liabilities of £1,733, and net assets of £270, leaving a deficiency of £1,463. The liquidator reported that since his appointment he had carried on the business and had retained the services of Mr. Goding and the secretary of the company, Mr. Goding's salary being £4 weekly and that of the secretary £3 10s. per week. Mr. Goding said that the company was formed on December 3rd last, with a nominal capital of £3,000. The company took over stock of £1,600, and goodwill £1,400. The consideration for the purchase of the business taken over was £2,000, and the company assumed liabilities of £1,000, £150 of which was still owing. Mr. Goding stated that he was interested in another wireless business in Cannon Street. He had been supplying that concern with goods up to the date of liquidation, but he had always received cash on delivery. R. R. Goding, Ltd., was formed with the sole object of carrying on a wholesale business, but it was not a success. The company was doing well before and just after Christmas last, but then trade began to decline. It was decided that Mr. E. H. Hawkins, of Messrs. Poppleton, Appleby & Hawkins, 4, Charterhouse Square, E.C., should be appointed to act as joint liquidator with Mr. Winn. The following are creditors:—

	£		£
Adie & Co., Ltd.	32	General Electric Co., Ltd.	26
Autoveyors, Ltd.	23	Garnett, Whitelev & Co., Ltd.	36
Acton Plating & Enamel Works	23	Graham, A., & Sons	84
Bedford Electric and Radio Co.	28	Hunt, A. H., Ltd.	93
Brentwood Works	64	London Electric Stores	38
Burndept Wireless Co., Ltd.	25	Marconiphone Co., Ltd.	123
British Thomson-Houston Co., Ltd.	31	McMichael, L., Ltd.	24
Brown, S. G., Ltd.	69	Mildner, F.	24
Cable Accessories Co., Ltd.	20	Metro-Vick Supplies, Ltd.	137
Dubilier Condenser Co., Ltd.	132	Marconi's, Ltd.	27
Eastick, P. P., & Sons	36	N.A.R.M.A.T.	21
Fuller's United Electric Works, Ltd.	22	Radio Communication Co., Ltd.	29
Ferranti, Ltd.	39	Radio Instruments, Ltd.	20
		Rothermel & Sons	42
		Wilkinson Wright, Ltd.	37

RADIO EQUIPMENT CO., LTD.—First meeting of creditors and contributories, April 20th, at Carey Street, W.C.

NEUTRON, LTD.—A petition for the winding up of this company was presented to the High Court by Messrs. E. Hunter and Co., Ltd., creditors, and was to be heard in London on April 13th.

BARCLAY RADIO STORES, LTD.—A meeting of members is called for May 10th, at 26, Corporation Street, Birmingham, to hear an account of the winding up from the liquidator, Mr. C. T. Appleby.

Dissolutions of Partnership.—GILBERT & HEARN, automobile and electrical engineers, Central Garage, Holyhead Road, Wednesbury.—Messrs. H. L. Gilbert and W. H. Hearn have dissolved partnership. Mr. Gilbert will attend to debts and continue the business.

HARRIS & MUDDIMAN, electrical engineers, 78, Cox Street, Coventry.—Mr. F. W. Harris and Mr. G. W. Muddiman have dissolved partnership. Mr. Muddiman will attend to debts and continue the business.

HOUCHIN & LAWRIE, electrical engineers, 9, Melbourne Parade, Palmers Green.—Mr. A. O. Houchin and Mr. A. Lawrie have dissolved partnership. Mr. Lawrie will attend to debts and continue the business under the same style.

Private Arrangements.—R. G. CRONYN, trading as Radio Sets and Supplies Co., 3, King Street, Maidenhead.—A meeting of creditors was held on April 7th at the offices of the Society of Incorporated Accountants, E.C., when a statement of affairs was submitted by Messrs. Harper & Broom, which disclosed liabilities of £2,112 and net assets of £1,258, leaving a deficiency of £854. In reply to a question debtor's solicitor said that a few local gentlemen were interested in the business, and they were prepared to offer a composition of 5s. in the £. That offer was not considered adequate, and it was increased

to 6s. 8d. in the £, payable as to 5s. in cash, and 1s. 8d. in three months. Several creditors said that they would not be prepared to accept the offer, as the figures in the statement of affairs showed more than the composition which had been suggested. It was eventually decided that the debtor should be requested to execute a deed of assignment in favour of Mr. W. A. J. Osborne, of Messrs. Corfield & Cripwell, and Mr. Charles Latham, accountant, 78, New Oxford Street, W.C., as joint trustees, with power to sell for an offer approved by a committee of inspection consisting of Mr. Bryne (London Electric Stores, Ltd.), Mr. Head (Marconiphone Co., Ltd.), Mr. Graham (J. K. Cooper & Sons, Ltd.), a representative of Standard Telephones & Cables, Ltd., and Mr. Smallbones (P. H. Smallbones, Ltd.).

The following are creditors :—

	£		£
London Electric Stores, Ltd. ...	223	Rouse, P.	41
British Thomson-Houston Co., Ltd.	85	Rothermel, R. A., Ltd.	95
Brown, S. G., Ltd.	61	Smallbones, P. H., Ltd.	94
Dew, A. J., & Co., Ltd.	58	Sterling Telephone & Electric Co., Ltd.	27
Edison Swan Electric Co., Ltd....	67	Standard Telephones & Cables, Ltd.	108
Elwell, C. F., Ltd.	38	Darby's Advertising, Ltd. ...	78
General Electric Co., Ltd. ...	51	Heyborn & Co.	44
Houghton-Butcher, Ltd.	32	Cooper, J. K., & Sons, Ltd. ...	121
Marconiphone Co., Ltd.	121		
Radio Communication Co., Ltd.	80		

Book Notices.—"The Slide Rule Simplified." By Donald C. Rogers. Pp. 76. London: Drawing Office Supplies, Ltd. Price 5s. net.—The working of the slide rule is laid down in a clear and concise manner in this book, and numerous examples are given throughout. Apart from the usual arithmetical applications, the solving of money problems by means of the slide rule is dealt with in a separate chapter.

The D. Van Nostrand Co., of New York, has sent us several lists of recently-published works on commercial and technical subjects. These include several works on electrical engineering by British and American authors.

"Official Directory of the British Chemical Plant Manufacturers' Association, 1926."—The directory, issued by the Association, is arranged in two main sections, an alphabetical list of the Association members, and a classified list of their products and manufactures. In addition a complete list of the officers and members of the executive committee is given and an introduction by the chairman outlines the objects of the Association.

"Kempe's Engineers' Year Book for 1926." 33rd Edition. Pp. 3,023. London: Crosby Lockwood & Son. Price 30s. net.

Home Lighting Course for Women.—The Electric Lamp Manufacturers' Association proposes to hold a home lighting course for women at its London Lighting Service Bureau, on April 29th and 30th. From a programme which we have received we gather that the course is designed for lady demonstrators in electrical showrooms and elsewhere. The subjects include a historical review of lighting from the earliest ages, the control of light (including the correct applications of decorative art), modern wiring systems, selling light and other matters of use and interest. The course will conclude with an informal dinner.

Chinese Notes.—The *Chinese Economic Bulletin* states that the capital of the Pootung Electricity Supply Co. is to be increased to a million dollars, and the plant capacity to 5,000 kW. Within the next five years the service is to be extended to a number of neighbouring districts, including Nanwei, Chuansha, and Kingsan.

The Futsing Electric Light Co. has suspended operations owing to the poor business prospects. Futsing merchants are endeavouring to refloat the company with a capital of $30,000, and $15,000 has already been raised.

British Goods in South America.—In the course of a report upon Bolivia (Stationery Office, 6d. net), Mr. A. J. Hill, Chargé d'Affaires at La Paz, states that British goods have the best reputation in South America, but price is the most important factor in sales. Better quality at the same price or the same quality at a lower price appear to be the only effective way of meeting competition. If the price is higher, the argument of better quality does not appeal to countries west of the Andes.

Wages in the Engineering Industry. — In pursuance of their altered policy of negotiating wage increases by districts instead of nationally, representatives of trade unions in the engineering industry met the employers' representatives at York on April 9th. The districts concerned were London, Bedford, Bradford, and Luton. After protracted discussions it was announced that the conference had failed to reach an agreement, and the trade union representatives are reported to have declared that the way was now clear to adopt any action considered necessary to enforce their claim. A meeting of the London Joint Engineering Trades Committee was held on Monday last, when the result of the York conference was reported.

The Committee adopted the following resolution after some discussion :—"That in view of the central conference held at York having registered a failure to agree on the London application for a 20s. a week increase, this joint engineering trades committee recommend to the district committees concerned immediately to obtain permission where necessary of their respective executive councils to issue a uniform ballot paper for strike action. This joint trades committee requests that immediate special meetings of each district committee be called to give effect to the foregoing resolution." The committee will meet again on Monday next to receive the replies from the various districts.

For Sale.—Edinburgh Corporation Electricity Department invites offers for 18 tons of clean scrap high-conductivity copper wire. Slough Trading Co., Ltd., invites offers for several gas-producer plants. By order of the liquidators, Messrs. Toplis & Harding, in conjunction with Messrs. Knight, Frank & Rutley, will sell by auction on April 28th, at the British Empire Exhibition, electric lighting and illuminating equipment, about 900 electric meters, cable, tools and stores, &c. (See our advertisement pages to-day.)

South Shields Tramway Dispute.—It is reported that the threat to cut off the power to South Shields tramways by the Electrical Power Engineers' Association unless one of its members, dismissed on grounds of redundancy, was reinstated has been withdrawn, and the Council has withdrawn the notice to the official concerned. The matter is to be considered in committee.

Diary.—Messrs. Thomas Bolton & Sons, Ltd., have sent us one of their 1926 diaries, which is handsomely bound and contains a great deal of information—general and technical.

Irish Free State Electrical Imports.—The official returns just to hand show that the imports of electrical goods into the Irish Free State during January last amounted to £22,624, as compared with £52,407 in the corresponding month of 1925. Electrical machinery is not included in these figures.

United States Electrical Exports.—The statistics of the January exports of electrical goods from the United States show that the total value was $7,144,842, which was approximately $1,750,000 below the December figure, and $283,000 below the total for January, 1925. The decrease was due to fluctuations in goods affected by seasonal and other conditions; the staple lines, on the whole, showed progress. The exports of generating equipment and transformers declined, particularly large a.c. generators, which were valued at only $73,087, as against $230,593 in January, 1925. Small a.c. generators and d.c. machines of more than 500 kW showed an increase. Switchboard equipment rose considerably in volume and value. Each of the four motor groups gained ground; the over 200-h.p. stationary class rose from $18,747 in January, 1925, to $146,455 in January last. As was anticipated exports of radio apparatus experienced a very marked decline, but an increased volume of batteries was exported. Domestic appliances showed a satisfactory increase.

Lighting and Power Notes.

Australia.—Collie (W.A.).—*Tenders* reports that the recommendation of the Western Australia Electric Advisory Board for the establishment of a South-West power station at Collie has been approved by the ratepayers of Collie. It was also recommended that a trust be formed, and that the proposal be financed under the migration agreement. It was stated that the proposed power station would at the outset supply the requirements of the Collie Collieries, and the towns of Collie and Bunbury.

Barking.—New Electricity Charges.—The Urban District Council has introduced the following new charges for electricity as from April 1st :—Lighting : first 500 kWh per quarter, 5d. per kWh, all additional energy, 4½d.; prepayment meters, 7d. per kWh; exterior lighting, 4d. per kWh. Power : varying from 3d. to kWh for the first 500 kWh per quarter to 1½d. per kWh for all energy in excess of 6,000 kWh, with special rates for large consumers, or 27s. 6d. per kW of maximum demand for quarter, plus ¾d. per kWh for d.c. supplies and ¾d. per kWh for a.c. supplies. Cooking and heating : First 50 kWh per quarter, 2d. per kWh; above this amount, 1½d. per kWh. Domestic rate : 15 per cent. per annum on rateable value, plus 1½d. per kWh for residential premises only. The above charges are subject to a discount of 5 per cent. for prompt payment of accounts, and to a minimum charge of 5s. per quarter.

Barlby.—Street Lighting.—A scheme of public electric lighting for Barlby and New Barlby has been sanctioned. The installation and supply of electricity is to be undertaken by the Olympia Oil and Cake Co., which has a model village at New Barlby.

Barrow.—Inquiry.—The Electricity Commissioners are to hold an inquiry on April 27th into the Town Council's scheme for the erection of a hydro-electric power station at Backbarrow.

Birkenhead.—Loan Sanctioned.—The Electricity Committee has received sanction to a loan of £10,500 in connection with the supply and erection of converting plant at the stations in Bentwick Street and Craven Street.

Blackpool.—Loan Sanctioned.—The Town Council has received sanction to a loan of £8,500 for meters.

Canada.—Hydro-Electric Development.—The Toronto correspondent of *The Times* reports that the House of Commons has approved the granting of permits by the Dominion Government to the Ontario Government and the Ontario Hydro-Electric Commission for the development of electric power on the St. Lawrence River at Morrisburg, and for using the increased flow of water from Niagara River. These permits are not to be issued until the report of the Inter-

national Board of Engineers, acting an behalf of Canada and the United States, and now investigating conditions on the St. Lawrence, makes its report.

Continental.—Belgium.—At the recent annual meeting of the Société Bruxelloise d'Electricité, of Brussels, it was stated that the sales of electricity during the past year showed an advance of 30 per cent., and that in order to meet the increasing demand for supply, the capacity of the plant at the power station is being increased from 23,000 to 30,000 kW.

Germany.—Some further particulars of the new super-power station which is to be established on the Rhine at Niederschworstadt, were given by the president of the Rheinfelden Electric Power Transmission Co., at a recent meeting at Sackingen. The power station will be on the Baden side of the river and the dam and navigable locks on the Swiss side. The concession is to run for 83 years, and it is expected that the power available will amount to a minimum of 100,000 h.p., which is to be equally distributed between the German State of Baden and Switzerland. The plant in the power station will comprise five turbo-alternators, each of 22,000 h.p. The estimated cost of the complete installation is £2,400,000.

Spain.—Work has recently been completed on the construction of a hydro-electric station near Ciñers, province of Leon, for the Sociedad Hidro-Electrica Legionnence. The plant, which utilises the water power of the River Porma, comprises two turbines coupled to 300-kVA alternators running at 730 r.p.m. The electricity is stepped up from 3,000 to 22,000 V for transmission to the town of Leon, a distance of about 30 miles.

Dumfries.—Hydro-Electric Scheme.—A hydro-electric installation is to be erected by the Town Council at a cost of £5,350. The supply will serve as an auxiliary to that provided by the electricity works. The engineer, Mr. Johnston, estimates that there will be a profit on the scheme of from £850 to £1,000 per annum. A new Francis type turbine complete with accessories is proposed.

Edinburgh.—New Plant.—The formal inaugural ceremony in connection with the installation of a new 10,000-kW generating set at Portobello power station was performed by Lady Sleigh, wife of the Lord Provost, on April 13th. The fourth to be installed, the new set was necessary to meet the demand for electricity which has increased rapidly since the station was opened.

Epsom.—Electricity Supply.—The Electricity Commissioners have informed the Urban District Council that it would be desirable to consider the possibility of a bulk supply of electricity as an alternative to the proposed extension of the generating plant, and have asked whether this aspect has been considered by the electrical adviser of the Joint Authority. The Council has decided to ascertain what steps the Joint Electricity Authority is taking in the matter.

Filey.—Electricity Supply.—The Urban District Council has consented to the Scarborough Corporation supplying electricity to the town subject to consumers being supplied upon the same terms and conditions as consumers within the borough.

Halifax.—Inter-Connection Scheme.—The Tramways and Electricity Committee has authorised the borough electrical engineer to confer with the Electricity Commissioners and the electrical engineers of the Bradford, Huddersfield, and Leeds Corporations, and the Yorkshire Electric Power Co., in connection with a proposal to provide an inter-connecting system for the electricity undertakings of the five authorities.

Lancaster.—Bulk Supply Charge.—The Electricity Committee has interview a deputation from the Carnforth Urban District Council as to a supply of electricity to that area and agreed to modify its terms by a reduction from 1d. to .9d. per kWh, in addition to a kW charge.

Loan Sanctioned.—Sanction has been received to a loan of £12,000 for the extension of the distributing system.

Electricity in Bulk.—In connection with the bulk supply to Morecambe, the Electricity Committee has agreed to lay a second h.p. main between Ridge Lane sub-station and the Morecambe boundary at a cost of £5,500.

Maidenhead.—Loans.—The Town Council has applied for sanction to a loan of £11,500 for e.h.p. cables, kiosks, transformers and switchgear, in connection with the extension of the supply to outlying districts, and also for £5,000 for prospective expenditure on l.p. mains and feeders.

Maidstone.—Loan.—The Town Council has applied for sanction to a loan of £10,000 for mains and services for the next three years.

Manchester.—Progress during February.—During the month of February the Corporation electricity undertaking showed an increase in connections of 2,168 kW, bringing the total to 279,488 kW; and the number of applications received for supply, including consumers for additional supplies, was 889, representing a total of 2,143 kW. The number of hired cookers connected increased by 105, bringing the total actually on circuit to 1,412. Applications for the hire of cookers totalled 102.

Loan.—The Corporation is applying for sanction to a loan of £50,000 for mains.

New Zealand.—Hydro-Electric Development.—According to *Tenders*, a further step in the development of the proposed power scheme in the Lake Manapouri district is the formation of a company with a capital of £20,000 to make an immediate commencement with the preparation of data and the submission of these to investors in Great Britain. Electrical energy developed will be utilised for the manufacture of nitrates from the air and other electro-chemical industries. It is expected that ultimately a total of 300,000 h.p. will be developed.

Northern Ireland.—Ardara (Co. Donegal).—The Electricity Committee has decided to proceed at once with the work of erecting the generating station in connection with the scheme for the electric lighting of the town.

Nottingham.—Loans.—The Electricity Committee has recommended to the Corporation that application be made for sanction to the following loans:—£135,000 for underground mains, transformers, switchgear, sub-station buildings and outside services; £15,000 for meters; and £50,000 for transmission lines, l.p. mains, sub-station buildings and transformer plant in the extended area authorised by the Nottingham Corporation Act, 1923.

Padiham.—Power Station Progress.—The generating station of Lancashire Electric Power Co., which is being erected on the banks of the Calder, is approaching completion. Cables have been laid in most of the suburban roads, and installations have been completed at Read and Sabden, but at present these towns are being supplied with electricity from Accrington.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

Windsor.—*The Windsor Electrical Installation Co., Ltd.*—Lighting: From 9d. to 8½d. per kWh.

Wimbledon.—Domestic purposes: From 1d. to ¾d. per kWh during the summer quarters only. Power: (Tariff A, flat rate) from 1¾d. to 1½d. per kWh; (Tariff C, flat rate) from 1¼d. to 1d. per kWh.

Watford.—Heating, business premises: Over 1,000 kWh per quarter, 1d. per kWh.

Sandbach.—Opposition to Scheme.—The Urban District Council has decided to place objections before the Electricity Commissioners to the use of overhead lines for the supply of electricity in the town.

South-East Lancashire Electricity Advisory Board.—*Bulk Supply to Bollington.*—The Engineering Advisory Committee has considered the question of a bulk supply of electricity to Bollington, and has decided that the Electricity Company of Macclesfield be requested to intimate to the Bollington Urban District Council the terms upon which it would be prepared to furnish a bulk supply.

New Converter for Heywood.—The Committee has recommended that the proposal of the Heywood Corporation to install a 750-kW converter be approved.

Bulk Supply to Ashton-in-Makerfield.—The question of a bulk supply to Ashton-in-Makerfield Urban District Council has been considered, and the Committee is of opinion that the supply should be furnished from the station of the Wigan Corporation, but as the L. E. P. Co. is a possible alternative source of supply, the Council is recommended to invite offers for its requirements from both undertakers.

Fringe Order.—The Committee has resolved to support the application of Eccles Corporation for a Fringe Order to supply in the Worsley urban district.

Sub-station Plant.—The provision of a 750-kW rotary converter at Hyde sub-station and one of 500 kW at Mossley sub-station of the Stalybridge, Hyde, Mossley, and Dukinfield Tramways and Electricity Board has been considered. and the Committee has resolved that application be made for sanction to a loan of £9,500 for the purpose.

Plant Extensions at Buxton.—The Committee has approved plant extensions at Buxton power station at a cost of £7,300.

Special Orders.—The Power Development Co.'s application for an Order to supply in the Chapel-en-le-Frith, Disley, and Macclesfield rural districts and Yeardsley-cum-Whaley urban district has been considered, and the Committee has requested the local authorities concerned to inform it whether they are prepared to apply for Orders for their areas. The Committee has decided to support the application of the Cheadle and Gatley Urban District Council for a Special Order to supply in the parish of Northern Etchells.

Ashton-under-Lyne.—A proposal for a bulk supply to Ashton-under-Lyne as an alternative to power station extensions has come before the Committee, but it has been decided that the extensions should be carried out.

The minutes of the proceedings of the Committee have been adopted by the Board, with the exception of the proposed extensions at Ashton-under-Lyne, which have been referred back, and the application of the Cheadle and Gatley Council for a Special Order, which has been deleted.

South Shields.—Loan.—The Town Council has applied for sanction to the borrowing of £82,000 for electricity purposes, of which £40,000 is required for mains extensions.

Assisted Wiring Scheme.—The electrical engineer has reported to the Council that up to date over 11,730 applications have been received under the assisted wiring scheme. The number of consumers actually connected is 6,170.

Special Orders.—Application has been made to the Electricity Commissioners by the Earby Urban District Council for a Special Order authorising it to supply electricity in the urban district.

The Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Petersfield Electric Light & Power Co., Ltd., to supply electricity in the urban district and part of the rural district of Petersfield; and the East Anglian Electric Supply Co., Ltd., to supply in the borough of Sudbury, the urban district of Glemsford, and the rural district of Melford.

Stockton-on-Tees.—ELECTRICITY SUPPLY.—The Rural District Council has approved an application by the Cleveland and Durham County Electric Power Co. for a Special Order to supply electricity within certain parts of the district. The maximum price in the Order is 10d. per kWh, but the company hopes to supply electricity at from 6½d. to 7d. The Darlington Rural District Council has referred to the Electricity Committee for consideration an application for a similar Order by the same company for powers to supply electricity to nine parishes in the Council's area.

Stoke.—ELECTRICITY IN BULK.—At a recent meeting of the Electricity Committee the question of the correspondence respecting the terms upon which a bulk supply would be given for distribution by the Power Development Co., Ltd., in the Uttoxeter Urban District and the Cheadle Rural District, was considered, and it was agreed that provided that the bulk supply amounts to 300,000 kWh per annum with a maximum demand not exceeding 130 kW, supply shall be given at £4 per kW per annum, with a power factor of not less than 80 per cent. and a consumption charge of ½d. per kWh, with a variation of 0.015d. per kWh, according to the cost of coal.

Tynemouth.—WIRING OF SMALL HOUSES.—The Electricity Committee has set aside an additional £5,000 for the assisted wiring scheme.

MAINS EXTENSIONS.—The Committee has decided to carry out mains extensions at a cost of £3,000.

United States.—ELECTRICAL DEVELOPMENT.—According to *Power*, a new power station is to be erected on the shore of Lake Michigan. It will be owned and operated by the State Line Generating Co. Construction will begin immediately. The first unit, which will have a capacity of 200,000 kW, will represent about 15 per cent. of the estimated combined maximum demand in 1929 of the companies which will take energy from it. The initial expenditure will be about $25,000,000. Four additional units of 200,000 kW each are contemplated—these to be installed from time to time as required—for an ultimate capacity of at least 1,000,000 kW. Development of this station is expected to be accompanied by development in underground transmission at high voltages. An order for six miles of 132,000-V cable for a connection with the 132,000-volt overhead transmission system of the Public Service Co. of Northern Illinois, has already been placed.

Wimbledon.—LOAN.—The Electricity Committee has received sanction to the borrowing of £6,000 for sub-station equipment and £13,000 for mains.

NEW SUB-STATIONS.—The Committee has obtained sites for sub-stations at the Belvedere estate and in Merton Park.

Winchester.—LOANS.—The Town Council has applied for sanction to loans of £1,500 for meters, and £4,000 for mains.

York.—ELECTRICITY IN SMALL HOUSES.—The Corporation Electricity Committee, with the object of inducing occupiers of small houses to use electricity for lighting, has approved a scheme to enable those who are unable to pay immediately for the initial cost of the installation to pay through a slot meter, for which no rent will be charged, instead of under the existing deferred payment scheme of quarterly instalments. The system will be limited to houses having a maximum of eight lighting points.

LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £25,500 for electricity purposes.

Tramway and Railway Notes.

Australia.—PERTH (W.A.).—The work of construction of tramways is progressing, and the State Tramways Advisory Board has recommended the construction of about 11 miles of tramway track in various suburbs, involving an expenditure of £117,846. This amount does not include £38,000 for 14 additional bogie cars and £5,500 for additional feeder cables.

SYDNEY (N.S.W.).—The first electric railway, the line to Illawarra, has been brought into commission. In Melbourne all the suburban lines are electrified, and the scheme has been extended to Lilydale and Fern Tree Gully. In connection with the scheme, each of the three converters already installed at the Prince Alfred sub-station, which is intended to supply power to the other sub-stations in the metropolitan area, will carry a load of about 6,000 h.p. continuously and about 13,000 h.p. for brief periods. There are smaller converters also in the sub-station to carry the tramway load in the district which it serves.—*Reuter's Trade Service* (Melbourne).

Cheadle and Gatley.—TRAMWAY EXTENSION REJECTED.—The Urban District Council has refused to entertain the proposals of the Manchester Corporation for the extension of the tramway along Manchester Road, Cheadle.

Colne.—LIGHT RAILWAY ABANDONMENT.—At the request of the Corporation the Minister of Transport has sanctioned the discontinuance of the Colne and Trawden light railway.

Continental.—SPAIN.—The authorities of the Northern of Spain Railway are reported to have decided to proceed with the electrification of the Manresa, Barcelona, and San Juan de Las Abadesa section of the line.

A concession has recently been granted for the construction of a secondary electric railway between Granda and Santa Fé.

SWITZERLAND.—The decision of the Swiss Federal Railway authorities to postpone for the present any new railway electrification scheme to follow immediately on the programme at present in course of execution, which is expected to be completed by 1928, is giving rise to many objections. The authorities of the Canton of Berne have adopted a resolution opposing any postponement, pointing out that the electrification of the Basle-Delsberg railway, the Brunig line, and the Entlebucher line are urgently needed. At Neuenburg also, objections have been raised against any delays in electrifying the Berne-Neuenburg main line.

ITALY.—As the results of trials on the Rome-Tivoli-Avezzano railway with an electric locomotive using 45-cycle a.c. at 10 kV, the Italian State Railway authorities have placed an order with the Breda Engineering Works, of Milan, for ten engines. They will have a wheelbase of 38 ft. and be fitted with two electric motors, the drive being through gearing and coupling rods to two of the axles. The equipment includes a transformer which steps down the energy to 1,600 V, while the motors can be run either in series or parallel.

Hartlepools.—RAILLESS CARS.—The Corporations of Hartlepool and West Hartlepool have decided to join in the purchase of twelve 36-seater railless cars.

Maidstone.—RAILLESS CARS.—The Town Council has adopted a recommendation to apply to the Ministry of Transport for sanction to run railless cars on the Barming route, and also to borrow £18,662, the estimated cost of the conversion and the provision of eight vehicles.

Middleton.—NEW ROUTE.—The Corporation has arranged with the Manchester Corporation to proceed with the application to the Ministry of Transport for an Order authorising the construction of the proposed Heywood and Middleton tramway.

United States.—RAILWAY ELECTRIFICATION.—The *Electric Railway Journal* reports that preliminary steps have been taken in the programme of the Pennsylvania Railroad for electrification at Philadelphia which entails the expenditure of $10,000,000 in addition to the cost of electrically equipped cars. The railroad's entire programme is scheduled for completion in 1927. The plans contemplate electrification of the lines between Philadelphia and Wilmington and West Chester *via* Media as the initial part of the railroad's general scheme of electrification of all suburban lines in the Philadelphia district. The total number of miles of line electrified will be about 52.

Telegraph and Telephone Notes.

Australia.—WIRELESS IN SMALL SHIPS.—The Seamen's Unions are demanding that wireless apparatus should be installed in all vessels, irrespective of tonnage. In shipping circles the opinion is expressed that if the steamer *Dorrigo*, which recently foundered near Maryborough, Queensland, had possessed a wireless installation, all her crew would have been saved.—*Reuter* (Brisbane).

Bulgaria.—TELEGRAPH CONFERENCE.—Ludwig Mayer, secretary of the International Posts and Telegraphs Association, took part in the eleventh congress of the Association of Bulgarian Posts and Telegraphs, which was opened at Sofia on April 4th.—*Reuter* (Sofia).

Colombia.—RADIO SERVICE REORGANISATION.—The Colombian Government has entered into a contract with the Marconi Co. for the erection and installation of additional wireless stations in various parts of the Republic. An engineer, Herr Carl Clemp, has been engaged for a year to organise the whole of the Republic's wireless services and to supervise the construction of ten new receiving stations which it has been decided to erect at Popayán, Manizales, Cartagona, Tunja, Honda, Bucaramanga, Barrancabermeja, Ibaqué, Ocana and Pasto. The State School of Wireless Telegraphy and Telephony established at Bogotá will also be entirely re-equipped.—*Reuter's Trade Service* (Bogota).

Czecho-Slovakia.—TELEPHONE COMMUNICATION.—The State Administration, which last year began the construction of a long-distance telephone system, is to finish laying during this

year the principal cables which will afford communication with the south-east. The laying of cables to the south and south-west is then to be begun. This year's programme includes the construction of an over-ground telephone cable from Zilina towards the east, in the direction of Kesce and Uzhorod.—*Reuter's Trade Service* (Prague).

Guatemala.—New Radio Service.—Wireless communication has been completed between the Island of Cuba and the Republic of Guatemala and is now in full operation.—*Reuter's Trade Service* (Habana).

India.—Trunk Telephones.—Our correspondent in India reports that the trunk telephone line between Calcutta and Delhi has been completed and is ready for traffic. The section of the line between Patna and Lucknow was completed some time ago, and there is already direct telephone connection between Lucknow and Delhi; the section from Sitarampur (near Asansole) to Patna has been completed. With the completion of the Calcutta-Delhi trunk line, the Department of Posts and Telegraphs will have carried out practically the entire project of long-distance telephony it took in hand about three years ago, and almost all the cities in Northern India will then have thus been linked. The long-distance line between Calcutta and Bombay will then remain to be completed, and work on this project is proceeding. Recently an experiment was carried out in telephone communication between Calcutta and Nagpur, and the result is reported to have been very satisfactory. Messages were sent from Howrah to Nagpur, and messages were received from Nagpur very distinctly. Howrah was selected for the experiment instead of Calcutta in order to avoid the use of the river cable. There is, however, some apprehension as regards the financial results of the Calcutta-Bombay telephone. It is estimated that if the call rate between Delhi and Bombay is Rs. 7-8 per three-minute call, the rate for calls between Calcutta and Bombay is likely to be about Rs. 15, and this high rate is not likely to prove conducive to a great demand for the telephone. What the call rate will be between Calcutta and Delhi is not known definitely, but it is not likely to be less than Rs. 5 for a three-minute conversation.

International Radio Telegraphy.—Conference.—Representatives of the principal wireless telegraph companies interested in international radio communication met last week at Monte Carlo, under the presidency of Mr. T. M. Perkins, American member of the Reparation Commission. The British delegates to the conference were Mr. Frederick Kellaway, managing director of Marconi's Wireless Telegraph Co., Ltd., and Lieut.-Colonel Simpson, deputy managing director. The United States were represented by Mr. Owen D. Young, president of the General Electric Co. and the Radio Corporation, General James C. Harboard, formerly with the American Army in France, and Colonel Roosevelt. M. Emile Girardeau, director of the Compagnie de Telegraphie sans Fil and of the Compagnie Radio France, was the principal French delegate, while the Telefunken Co. and the Italo-Radio Co. were also represented. The International Wireless Telegraphy Committee has held its preceding meetings in New York, London, and Berlin. The chief aim of the present conference is to prepare for the opening up within a short period of wireless communication between Brazil and other countries. The powerful station at Rio de Janeiro is nearing completion, and satisfactory trials have already been made. April 21st has been fixed as the date on which direct wireless services between Brazil and the United States, France, Great Britain, Germany, and Italy will be inaugurated. The Rio de Janeiro station has twelve pylons 200 metres high, and has a power of 500 kW. Transmission on a short wave will be employed as well as on the long wave which has already been tested.—*Reuter* (Paris).

Irish Free State.—Party Line Telephones.—The party line telephone system is being considerably extended in the Free State. Such a line is not as a rule provided for less than three subscribers, in which case the rental is £4 each per year; when there are only two subscribers per line the rental is £4 10s. each per annum.

New Cable Office.—Liverpool.—The Western Union Cable Co. has opened a new office in the Liverpool Produce Exchange to afford direct communication with the produce exchanges in New York and Chicago. As the exchanges in Liverpool and America are "open" simultaneously only during one hour each day, the new premises will only be in use from 3.15 to 4.30 p.m. each day. The new direct cable gives a "three minutes' round trip" service. At the opening ceremony last week a cable of congratulation was sent to the American exchanges, "hoping that the extended facilities for trade provided by the Western Union will result in increased trade to the mutual benefit of both exchanges."

Sweden.—Russian Telegraph Communication.—Telegrams to Russia, which were formerly collected and dispatched by the Store Nordiske Telegrafselskabs station at Goteburg, will in future be sent by the telegraph station at Stockholm, with Helsingfors acting as a relay point for messages between Stockholm and Leningrad. *Commerce Reports* believes that swifter communication between the two countries will result from the change of stations.

Switzerland.—Telephone Boxes.—The firm of Gygax and Limberger, of Alstetten, Zurich, is making a speciality of small telephone call boxes for use in offices. It is claimed that "Phonivor" cabins, as they are termed, are noiseproof and afford greater privacy of conversation than when the 'phone is installed in an open office.

Radio Notes.

Australia.—Demand for Sets.—In an interview regarding wireless in Victoria, the manager of a Melbourne firm said that there continued to be a good demand for sets and parts; there was now a very noticeable increase in the demand for high grade complete sets. At the beginning, he said, the majority of purchasers bought wireless parts which they assembled themselves, and in many cases the cheaper class of goods was purchased; lately, however, the buying of parts had given place, to a large extent, to the buying of complete sets. A recent shipment of high-grade American sets had been quickly disposed of, and several more sets had been ordered for immediate delivery when landed.

A report from Perth, Western Australia, says that if the number of listening licences can be accepted as an indication, wireless is losing a great deal of its popularity. There were 4,055 licences in existence in January, but it is estimated that at the end of March the total will be only 2,500.—*Reuter's Trade Service* (Melbourne).

On the other hand, *The Times* correspondent states that in his recent annual report, the Australian Postmaster-General says that the growing popularity of broadcasting is enabling the companies to contemplate wider activities. The revenue from licence fees is divided amongst the broadcasting companies, a larger proportion being paid to those which operate high-power stations than to those whose transmitters are of medium or small power. The area allotted to each company is divided into zones, and the amount of the licence fee depends upon the zone in which the listener lives. At present, those whose homes are within a radius of 250 miles of a broadcasting station pay 35s. for the first year and 27s. 6d. a year afterwards. Up to the end of last year the total number of licences was in the neighbourhood of 80,000, and the revenue from fees about £130,000. There are numbers of unlicensed receiving sets in use, and proceedings have been taken against certain offenders.

Australia has at present ten broadcasting stations situated in or near large towns. Two of these, the Sydney station and that at Perth, are rated at 5 kilowatts and work on wavelengths of 1,100 and 1,250 metres respectively. The remainder, with the exception of 3LO, the Melbourne station, which is rated at 5 kilowatts, are medium or low-power stations. All of them work on wave-lengths between 300 and 500 metres. One, Brisbane (4QG), which is rated at .75 kilowatt and works on a wave-length of 385 metres, is conducted by the Government; the Post Office has placed telephone lines at the companies' disposal for simultaneous broadcasting.

Chile.—New Station.—A new long-range broadcasting station has been opened at Santiago de Chile, working with a power of 1,000 kW, which is capable of being tripled at any moment. The call letters are CMAC.—*Reuter's Trade Service* (Santiago de Chile).

Dutch East Indies.—New Station.—According to *Commerce Reports*, the Government of the Dutch East Indies has authorised the erection of a large radio broadcasting station and the private use of receiving sets under licence.

El Salvador.—New Station.—A wireless station has been erected on the roof of the National Theatre at San Salvador, capital of the Republic of El Salvador, and will shortly be put into operation.—*Reuter's Trade Service* (San Salvador).

India.—Proposed Station.—The Indian Radio Telegraph Co. is reported to be planning the construction of a 12-kW broadcasting station at Calcutta. Details are not yet available, says *Commerce Reports*, which understands that this is one of two stations to be built in India, the other to be at Bombay.

Poland.—New Station.—On April 18th next, a new broadcasting station will be opened at Warsaw by the Prime Minister, Count Skrzynski, whose speech will be broadcast.—*Reuter* (Warsaw).

Russia.—Radio Interest.—There are six broadcasting stations of 2,000 watts under construction, and one of 50,000 watts, with five stations in Moscow, where the public reading rooms are equipped with receivers and loud-speakers so that people too poor to purchase a set are able to listen, says *T. & T. Age*. It is estimated that over 20,000 Russians in Moscow alone have managed to build and operate their own sets without the knowledge of the authorities. Broadcasting in Russia is under the control of the Commissariat of Posts and Telegraphs.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—Melbourne.—June 16th. City Council. Turbo-alternator, exciter, and condensing plant.*

Adwick-le-Street.—May 19th. Urban District Council. H.p. switchgear and cables, step-down transformers, l.p. distribution gear, pillars, cables, joint boxes, &c. (See this issue.)

Belfast.—April 22nd. Libraries, Museum and Art Committee. Lifts for the new museum and art gallery. (See this issue.)

Belgium.—April 28th. Belgian Post and Telegraph authorities at La Salle Madeleine, Brussels, 39,000 metres of cotton-covered wire, 175,000 metres of cord-covered wire, 100,000 metres of compound wire, 250,000 metres of twisted wire, 100,000 metres of bare-lead covered cable, 50,000 metres ditto, and 5,182 metres paper-insulated cable. Particulars (Cahier des Charges Special No. 3-177) for 5 francs.

April 22nd. The municipal authorities of Schaerbeek, Brussels. 8,000 metres of h. and l.p. armoured cable. Particulars from Service de l'Electricité, Hotel Communal, Schaerbeek.

Grimsby.—April 26th. Electricity Department. E.h.p. cell-type switchgear. (See this issue.)

Barking.—April 20th. County of London Electric Supply Co., Ltd. Circulating-water pumps and pump-house equipment, circulating-water screening plant, and boiler-house and coal-handling plant. (March 19th.)

May 10th. Coal-unloading, storing, and reclaiming plant. (April 9th.)

May 11th. Switchgear and accessories, transformers and piping equipment. (March 26th.)

Bentley-with-Arksey.—April 20th. West Riding Education Committee. Electric lighting installation at Bentley Road school. Specifications, Education Department, County Hall, Wakefield.

Bolton-upon-Dearne.—April 22nd. Dearne District Electricity Board. Electric cables and accessories. (April 2nd.)

Chile.—Santiago.—August 20th. Chilean State Railways. Signals, telegraphs and telephones, electrical material for sub-stations, aerial lines, and lighting.*

Dartford.—April 21st. Electricity Department. Coal for 6 or 12 months. (April 9th.)

Dundee.—April 20th. Education Authority. Electric lighting at new central Advanced School at Blackness Road. Schedules from Messrs. Maclaren, Soutar & Salmond, architects, 16, South Tay Street, Dundee.

Exeter.—May 11th. Electricity Department. Boiler-house plant complete:—Two water-tube boilers with economisers, pumps, coal bunkers, conveyor, and accessories. Self-supporting steel chimney, induced-draught fan, and accessories. (April 9th.)

Ferry Fryston (Yorks.).—April 20th. West Riding County Council. Electric lighting installation at Ferry Fryston, Airedale, new school. Specifications from Education Department, County Hall, Wakefield.

Harrogate.—April 25th. Electricity Department. H.p. and l.p. switchgear for sub-stations. (April 9th.)

India.—April 30th. India Store Department. 22,000-V cables. (April 2nd.)

April 30th. Alkaline train-lighting cells. (See this issue.)

May 7th. 15 motor coach underframes and bodies, 30 motor bogie trucks. (March 12th.)

May 14th. Three 5-kW oil engine-driven generator sets, one switchboard, and two pumping sets.*

London.—London County Council.—May 4th. Electric wiring and fittings at the Alton Street elementary school, Poplar, E. (See this issue.)

H.M. Office of Works.—April 28th. Fuse boards and switches. (See this issue.)

New Zealand.—June 21st. Auckland Electric Power Board. L.p. insulators, &c.*

Wellington.—May 12th. Post and Telegraph Department. 18 switchboards.*

Nottingham.—May 31st. Board of Guardians. One 60-kW d.c. turbo-generator, &c., and alterations to main switchboard, &c. (See this issue.)

Southend-on-Sea.—April 19th. Electricity Department. 1,450 current limiters. (April 2nd.)

Spain.—Madrid.—May 9th. Compania de los Caminos de Hierro del Norte. Overhead line, converting sub-stations, locomotives and motor coaches for the electrification of the lines from Barcelona to Manresa and San Juan de las Adebesas in one contract. The constructors are to obtain as much of their supplies from Spanish industries as possible.

Turkey.—May 15th. Direction Générale des Postes et Télégraphes. 111,000 metres of 3, 7, 10 and 12 pair aerial telephone cable, 10,000 metres of 3, 7, 10 and 12 pair underground cable with joint boxes and accessories.*

Warrington.—April 26th. Electricity and Tramways Committee. L.p. paper and lead-covered cables. (April 9th.)

Waterford.—May 12th. Electricity Department. Two 250-kVA, 3-phase alternators direct coupled to heavy oil engines. e.h.p. mains and l.p. underground distribution system, transformer kiosks, pillars, street lighting services, l.p. overhead distribution system, &c. (April 9th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—Melbourne.—Postmaster-General's Department. Accepted:—

Weston electrical instruments (£612).—Warburton Franki (Melb.), Ltd.
Portable three-element oscillograph (£721).—Australian Westinghouse Electric Co., Ltd.
½ mile 10-quad and ½ mile 20-quad lead-covered multiple cable (£625).—Standard Telephones & Cables, Ltd.
Automatic telephone exchange equipment for South Brisbane (£3,772).—Siemens Bros. & Co., Ltd.
Equipment for the South Brisbane and Albion automatic telephone exchanges (£2,364).—Siemens (Aust.) Pty., Ltd.

Victorian Railways. Accepted:—

Battery-charging equipment (£226 and £95).—Australian General Electric Co., Ltd.

Melbourne and Metropolitan Tramways Board. Accepted:—

Four motor equipments (£5,700).—Australian Westinghouse Electric Co., Ltd.
Air brake equipments with spares (£6,744), safety devices for single-truck cars (£1,697).—Australian General Electric Co., Ltd. —*Tenders.*

Bolton.—Electricity Committee. Accepted:—

Renewals to battery, Back-o'-th'-Bank generating station.—Chloride Electrical Storage Co., Ltd.
E.h.p. switchgear, Back-o'-th'-Bank generating station.—Metropolitan-Vickers Electrical Co., Ltd.

Burnley.—Electricity Committee. Accepted:—

Pumps for the 2,000-kW turbine at the generating station (£827).—Hick, Hargreaves & Co., Ltd.

Chester.—Board of Guardians. Accepted:—

Electrical material for the Poor Law Institution.—Commercial Electric Co.

Chesterfield.—Electricity Committee. One 1,000-kW rotary converter equipment, complete with switchgear:—

Mather & Platt, Ltd. (Accepted.)	**£5,002**
Metropolitan-Vickers Electrical Co., Ltd.	5,091
Newton Bros., Ltd.	5,782
General Electric Co., Ltd.	5,819
English Electric Co., Ltd.	5,965

Croydon.—Board of Guardians. Accepted:—

Electrical fittings and appliances for six months.—Commercial Electric Co., Ltd.

Liverpool.—Tramways and Electric Power Committee. Accepted. Materials for 12 months:—

Meters.—Ferranti, Ltd.
Stoneware troughing, insulators, &c.—J. Place & Sons, Ltd.; Callender's Cable & Construction Co., Ltd.; J. Bourne & Sons.
Electrical sundries, switches, fuses, &c.—Sykes & Dyson, Ltd.; Cable Accessories Co., Ltd.; L. Weekes, Ltd.; Simplex Conduits, Ltd.
Cables and accessories for street mains.—Callender's Cable & Construction Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Dussek Bitumen Co., Ltd.
Insulated cables.—Liverpool Electric Cable Co., Ltd.; W. Geipel & Co., Ltd.

City Council. Accepted:—

Switchgear for Lister drive power station (£18,894).—Metropolitan-Vickers Electrical Co., Ltd.
One 1,500-kW (£6,482) and two 1,000-kW (£8,562) rotary converters.—Mather & Platt, Ltd.

Baths Committee. Accepted:—

Installation of electric light at Cornwallis Street Baths (£207).—Lambton and Hobster.

London.—Metropolitan Asylums Board.

Installation of fuel economiser at Southern Hospital:—

E. Green & Son, Ltd. (Recommended.)	**£829**
E. Danks & Co. (Oldbury), Ltd.	829
Clay Cross Co., Ltd.	854
Goodbrand & Co., Ltd.	861
A. Lowcock, Ltd.	872

Installation of steam boilers at Southern Hospital:—

John Thompson (Wolverhampton), Ltd. (Recommended)	**£1,850**
J. & J. Horsfield, Ltd.	1,850
Yates & Thom, Ltd.	1,862
I. & B. Umpleby, Ltd.	1,882
Clayton, Son & Co., Ltd.	1,944

H. & T. Danks (Netherton), Ltd.	2,120
D. Adamson & Co., Ltd.	2,162
J. Foster & Sons	2,285

Installation of electric lighting at Southern Hospital:—

Alpha Mfg. & Electrical Co., Ltd. (Recommended.)	**£3,010**
T. Clarke & Co., Ltd.	3,700
Read & Partners, Ltd.	3,748
Smethurst & Co. (London), Ltd.	3,912
Brightside Foundry & Engineering Co., Ltd.	3,943
Coley & Swinnerton, Ltd.	4,124
Toy & Winslow	4,150
Kershaws	4,500
Burdette & Co., Ltd.	4,520
S. Dixon & Son, Ltd.	4,548
H. B. Giles	4,637
Taylor & Allen, Ltd.	4,750

Underground cable from hospital to gate lodge, electric lighting installation at the lodge, &c., at Colindale Hospital:—

V. G. Middleton & Co., Ltd. (Recommended.)	**£212**
T. Clarke & Co., Ltd.	226
Toy & Winslow	234
Lund Bros. & Co.	252
Buchanan & Curwen	265
G. E. Taylor & Co.	280

STEPNEY.—Electricity Supply Committee. With further reference to our note on page 586, ELEC. REV., April 9th, the following is the complete list of tenders received :—

Two 150-kVA transformers :—

Hackbridge Electrical Construction Co., Ltd. (Recommended)	**£348**
Ferranti, Ltd.	411
British Electric Transformer Co., Ltd.	422

100 single disconnecting boxes :—

Lucy, W., & Co., Ltd. (Recommended)	**£115**
Universal Electrical Manufacturing Co.	129
British Insulated Cables, Ltd.	162
W. T. Henley's Telegraph Works Co., Ltd.	258

50 TC/C disconnecting boxes :—

Universal Electrical Manufacturing Co. (Recommended) ...	**£107**
W. Lucy & Co., Ltd.	131
British Insulated Cables, Ltd.	134
W. T. Henley's Telegraph Works Co., Ltd.	230

Supply of cables for the year ending March 31st, 1927 :—

W. T. Henley's Telegraph Works Co., Ltd. (Recommended)	**£27,611**
W. T. Glover & Co., Ltd.	28,063
Pirelli-General Cable Works, Ltd.	28,074
Hackbridge Cable Co., Ltd.	28,078
Siemens Bros. & Co., Ltd.	28,158
Standard Telephones & Cables, Ltd.	28,204
British Insulated Cables, Ltd.	28,245
Callender's Cable & Construction Co., Ltd.	28,665

Newcastle (Staffs.).—Town Council. Accepted:—
Laying of electricity mains on the Liverpool Road and Westlands housing sites (£3,038).—Callender's Cable & Construction Co., Ltd.

Plymouth.—Electricity Committee. Accepted:—
Turbo-alternator (£29,020).—Metropolitan-Vickers Electrical Co., Ltd.
Converter (£1,360).—Crompton & Co., Ltd.
Transformers.—British Electric Transformer Co., Ltd.
Cables.—British Insulated Cables, Ltd.

Salford.—Electricity Committee. Accepted:—
200 small electric cookers (£2,575).—Hotpoint Electric Appliance Co.

Sheffield.—Electric Supply Committee. Accepted:—
Transformers (£3,416).—British Electric Transformer Co., Ltd.
Chain-grate stokers and accessories for boilers at Neepsend station (£3,144). —E. Bennis & Co., Ltd.
Transformer sub-station at Kilton Hill (£1,299).—G. Longden & Son, Ltd

Stafford.—Electricity Committee. Accepted:—
Transformer and necessary equipment (£656).—English Electric Co., Ltd

Tynemouth.—Electricity Committee. Accepted:—
Cable (£125).—Standard Telephones & Cables, Ltd.

Weymouth.—Electricity Committee. Accepted:—
Mains extensions.—Johnson & Phillips, Ltd.

Forthcoming Events.

Institution of Mechanical Engineers.—Friday, April 16th. At the Institution, Storey's Gate, S.W. At 6 p.m. Paper on "The Modern Development of Paper-mill Plant," by Mr. W. Worby Beaumont and Mr. L. N. Burt.
Friday, April 23rd. Informal meeting. Discussion on "What Our Foreign Competitors are Doing," to be introduced by Mr. F. J. Hookham.

Junior Institution of Engineers.—Friday, April 16th. At 39, Victoria Street, S.W. At 7.30 p.m. Lecturette, "Automobile Lighting, Starting, and Ignition," by Mr. T. L. Allison.

Salford Technical and Engineering Association.—Saturday, April 17th. At the Royal Technical College. At 7 p.m. Paper on "Switchboard Instruments," by Mr. A. H. Higgs.

Association of Mining Electrical Engineers (South Wales Branch).—Saturday, April 17th. At the South Wales Institute of Engineers, Park Place, Cardiff. At 6 p.m. Lecture on "Auto-Synchronous Motors," by Mr. E. E. Tasker.

(London Branch).—Tuesday, April 20th. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 6.30 p.m. Paper on "Coal Screening, Crushing, Blending, and Conveying Apparatus," by Mr. F. H. F. Hampton.

British Horological Institute.—Wednesday, April 21st. At 35, Northampton Square, E.C. At 6.30 p.m. Lecture on "Clockwork Gas Controllers and Electric Time Switches," by Mr. E. H. Horstmann.

Edinburgh Electrical Society.—Wednesday, April 21st. At the Royal Scottish Society of Arts, 117, George Street. At 8 p.m. Paper on "Country Distribution," by Mr. J. S. Thomson.

Institution of Electrical Engineers.—Thursday, April 22nd. At the Institution, Victoria Embankment, W.C. At 6 p.m. Seventeenth Kelvin Lecture on "The Mechanics of the Electric Field," by Sir J. J. Thomson, F.R.S.

(Mersey and North Wales (Liverpool) Centre).—Monday, April 19th. At the University, Liverpool. At 7 p.m. Paper on "An All-Electric House," by Prof S. P. Smith.

(Sheffield Sub-Centre).—Wednesday, April 21st. At the Royal Victoria Hotel, Sheffield. Paper on "Electricity in Mines," by Major E. I. David.

(Tees-side Sub-Centre).—Monday, April 19th. At the Cleveland Technical Institute, Middlesbrough. At 7.15 p.m. Ordinary meeting.

(South Midland Students' Section).—Visit to Rugby as guests of the Rugby Engineering Society Students' Section—3-5 p.m., tour of the works of the British Thomson-Houston Co., Ltd. 7 p.m., at Benn Buildings, Rugby, paper on "Induction Motors," by Mr. D. G. Sandeman. 9-11 p.m., smoking concert.

Physical Society of London.—Friday, April 23rd. At the Imperial College of Science, Imperial Institute Road, S.W.7. At 5 p.m. Lecture on "The Absorption of Radiation by the Upper Atmosphere," by Prof. C. Fabry.

Royal Institution.—Friday, April 23rd. At 21, Albemarle Street, W. At 9 p.m. Lecture on "Luminous Discharge Through Rare Gases," by Prof. R. Whiddington

Birmingham Electric Club.—Friday, April 23rd. At the Grand Hotel, Colmore Row, Birmingham. At 7 p.m. Discussion on the "I.E.E. Wiring Rules," to be opened by Mr. C. G. McDonald and Mr. H. Joseph.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

VULCOT insulation (sheets).
ZYROLITE or XYNITE insulation.
Hedge clipping shears (electrical).
ELMO portable drilling machines.

Notes.

An A.C. Link.—An interesting scheme has been adopted for linking up the two d.c. power stations of the Guernsey Electric Light and Power Co., Ltd., at Les Amballes and St. Sampson's Street, St. Peter Port. At each station a 250-kW reversible motor-generator set has been installed, being driven from the normal d.c. supply, 420/480 V, and generating a.c. at 6,600 V, three-phase, 50 cycles. The a.c. system is employed for the transmission link between these stations and a new sub-station which has been erected at St. Peter Port, where a 250-kW rotary converter, with the necessary transformers and switchgear, is installed for supplying d.c. energy. The lighting load is balanced between the outers and neutral by two static balancers, which are suitable for an out-of-balance current up to 80 A. The complete electrical equipment for this contract was supplied by the General Electric Co., Ltd.

London Street Accidents.—An official return of street accidents shows, says the *Evening News*, that in the metropolitan district 2,485 accidents were caused by tramcars in 1925; fatalities due to the same cause numbered 30, as compared with 27 in 1924. Omnibuses were responsible for 3,607 non-fatal and 139 fatal accidents.

Notes From Switzerland.—A scheme is shortly to be commenced to harness the waters of the Dranse of Entremont and of the Ferret below Orsières, and direct them towards Sembrancher (on the Martigny-Orsières railway), where a power station will be erected. The power yield is estimated at about 10,000 h.p. The undertaking will be in the hands of the Société Romande d'Electricité, which already owns the power house of Vouvry.

The Swiss Federal Railways are arranging, together with the Comptoir Suisse de Lausanne, the Union Romande de Tourisme, and the Commission Romande de la Ligne du Simplon, for an exhibition to be held next September in Lausanne, when lectures will be given on the advantages of this international and electrified railway. A very large synoptical map will be used to give a clear idea of the ramifications of this most important line, and other electric and mountain railways of Switzerland connected with the Simplon, as well as those of France and Italy and the Cie. Internationale des Wagons-lits. It is expected that such an exhibition will not only favour the interests of Swiss "tourism," but will also afford an excellent object-lesson in the advantages of electricity to those countries which, as yet, have not adopted railway electrification.

The Superiority of Tramways.—Mr. Henry Mozley, general manager of Burnley Tramways and Motor 'Buses, recently addressed the Burnley Rotary Club on road transport, dealing particularly with local problems. He said that people were becoming impatient of crowded areas, and desired more healthy surroundings. Without transport this could not be obtained. Dealing with the cry of "Scrap the tramways," the speaker said the Burnley Tramways now carried 24 million passengers and 134,000 parcels per annum. With only seven small 'buses on short experimental routes, the number of passengers per annum now numbered two millions. Last year £5,819 was contributed to the funds of the local authorities interested. Imperial funds benefited to the amount of £5,392, and £29,026 was paid for electrical energy. What would their lighting and power cost but for this? The tramways maintained at least one third of the highways on which they ran. For economy, reliability, regularity of service, and adaptability for peak-load periods there was no transport system equal to the tramways, and this was the considered view not only of Government Departments, but by every expert tramway operator. Those who advocated scrapping the tramways and substituting 'buses were sinning against knowledge. They required at least 2½ 'buses to do the work of one tramcar. Pneumatic tires cost £90 and ran only 20 to 30,000 miles. Steel tires on a car cost £20 and ran 70,000 miles. The longest daily mileage of a 'bus (on town service) was 117 miles; of the electric car it was 151 miles. The normal life of a 'bus was eight years, and electric cars were like new after 25 years. If they scrapped the trams they would have to pay probably £100 000 for road reinstatement and the remainder of the debt, which exceeded £100,000. The omnibus depended for its power mainly upon a foreign supply of spirit, which was largely controlled in regard to prices. Among the other disadvantages of the motor-'bus were slow acceleration and limited carrying capacity.

Electric Ignition of Firedamp.—In Paper No. 20, "The Electric Ignition of Firedamp: Alternating and Continuous Currents Compared," by R. V. Wheeler, issued by the Safety in Mines Research Board, price 1s. net, the author compares alternating and direct currents with respect to the ability of their "breakflashes" to ignite firedamp. The comparisons are the result of researches over a number of years and the different forms of apparatus used in the researches are described. The following results were obtained from the ignition of methane-air mixtures when using direct and alternating currents:—

Ignition of mixtures by continuous and alternating currents (50 ∼) at 35 V added inductance, 0.095 henry.

Methane (per cent.).	Igniting current, amperes. D.C.	Igniting current, amperes. Alternating (crest values).

Naval Electrical Officers' Pay.—The pay of senior electrical engineers, electrical engineers, and assistant electrical engineers, has formed the subject of a recent award of the Industrial Court. The following basic salaries, *i.e.*, salaries exclusive of cost-of-living bonus, were awarded by the Court. Assistant electrical engineer, £310 a year, rising by annual increments of £15 to £475; electrical engineers, £475, rising by annual increments of £25 to £650; senior electrical engineer, £575, rising by annual increments of £25 to £725. The Government has decided to give effect to the award, as from January 1st, 1926. The officers concerned will enter the new scales at the minimum, or at their existing salary, *plus* the proportion of increment earned on the old scale, whichever is the greater. The new scales will not be applicable to temporary electrical engineers or temporary assistant electrical engineers.—*The Times.*

Appointments Vacant.—Secretary and treasurer to the West Midlands Joint Electricity; switchboard attendants, for the Perth Corporation electricity works. (See our advertisement pages to-day.)

Lubricating and Allied Oils.—The following is a brief abstract of a paper on the above subject delivered before the Institution of Engineering Inspection by Mr. Elliot A. Evans, F.C.S. In considering lubricants there are two aspects to bear in mind, lubricating value and value as a lubricant. The lubricating value is the power of a substance to reduce friction, while the value of a body as a lubricant is much more important, and depends upon a number of factors. Primarily it must be capable of reducing friction, and, secondly, it must have characteristics which permit its use for specific purposes with the minimum of inconvenience. Mineral oils have, in the majority of cases, a better value as lubricants than have fatty oils, but it is generally conceded that fatty oils have better lubricating values. The difficulty in compiling specifications for lubricants is due inherently to their complex nature. Mineral oils are composed of many hydrocarbons, diverse in composition and behaviour, whose chemical properties are such as to bewilder even the most ardent chemist. The natural outcome of these difficulties is to formulate arbitrary tests of a physical or chemical nature to establish definite characteristics, such as specific gravity, viscosity, flashpoint, &c., which, when considered as a whole, together with experience gained in practice, serve a useful purpose. Any one of these tests by itself denotes practically nothing. Specific gravity, if considered alone, is useful to check weight notes of deliveries. Flash point is the temperature at which an oil will take fire when a naked light is applied—a test, in fact, indicative of the fire hazard. Viscosity plays a prominent rôle in all specifications, and must therefore be measured with some degree of accuracy and recorded in a universal way, and at temperatures agreed upon by common consent. The specific gravity of all oils from one and the same source increases with increasing viscosity, and the same is more or less true of the flash point except when the cylinder oil stocks are reached. Low specific gravity oils are frequently associated with low coke and oxidation values; in a measure it is true, but it would be very unsafe to imagine that by virtue of an oil having a low specific gravity it would also have a low oxidation value. On the other hand, high specific gravity oils invariably have a high oxidation value.

Transformer Testing Equipment.—In a recently-issued publication of the United States of America Bureau of Standards, Scientific Papers, Vol. 20, No. 516, December, 1925, price 15 cents, a description is given of the apparatus which has been developed at the Bureau for the testing of standard voltage transformers. The equipment, a shielded resistor, consists of a number of impedances in series which are so shielded as to prevent any capacitance effects due to their relationship to other objects about them. The working circuit has a total resistance of about 520,000 ohms and is made of 27 sections, each being enclosed in a brass box or shield which is connected to the suitable point of a "guard" circuit which is connected in parallel with th e working circuit. The units consist of manganin resistance wire wound on cards of built-up mica, each card being hung vertically in its shield on two suitably placed glass rods. The guard circuit has the same resistance as the working circuit and is made of similar cards which are placed in the open. The equipment is mounted on a rack made up of wooden bars spaced by porcelain supports. It is claimed that with a resistance of 500,000 ohms for both the shielded and unshielded circuits, an accuracy approaching 0.01 per cent. can be obtained on commercial frequencies at pressures up to 30,000 V.

Relieving the Rates.—By a resolution adopted in 1920, the Manchester City Council limited the amounts which could be contributed in relief of the rates from the profits of the municipal trading undertakings. At last week's meeting of the Council, however, Ald. Swales moved that the rescission of this resolution should be considered in so far as it applied to the Tramway Department and that that Department should be instructed to so arrange fares, &c., that after meeting all working expenses, including capital charges, and adequate provision for renewals and reserves, it should contribute an annual sum of £100,000 in aid of the rates, the first allocation being made from the profits of the year 1926-27. In opposing the motion Councillor Binns said that to impose those conditions on the tramways would bear hardly upon the users of the system. If the Department had surplus profits they should be used to eliminate private capital from the undertaking.

The motion was eventually carried and a report upon the matter will be received in due course.

Summer Time.—Attention is drawn to the fact that "Summer time" commences at 2 a.m. on Sunday next, and accordingly all clocks should be advanced one hour during the night April 17-18th. Similar time adjustments will be made in France, Belgium and Spain on the same date, but in Holland the change took place on the 15th.

Electro-magnetic Treatment of Steels.—In a publication, "The Electro-Magnetic Heat Treatment of Alloy Steels," No. 36, April, 1926, issued by Messrs. Automatic & Electric Furnaces, Ltd., the limits of application of the Wild-Barfield magnetic indicators to the alloy steels commercially employed today, are considered. The correct heating point to which nickel steel should be carried is that at which the steel becomes entirely non-magnetic. The addition of manganese to ordinary carbon steel has a similar effect upon the non-magnetic point and the limit for heating is at the magnetic change. In six per cent. tungsten-steel the alloy is not completely absorbed at the non-magnetic point and the consequent superheating of the steel renders the magnetic detector useless. Chrome steel should be allowed to soak in the furnace for a few minutes on an even or falling heat, after the current is switched off, to give the best condition for quenching. The latter treatment also applies to nickel-chrome steel. Other alloy-steels dealt with are vanadium, molybdenum, cobalt, chrome-vanadium, chrome-tungsten, chrome-molybdenum, chrome-manganese, and cobalt-chrome.

Sheffield and the Electricity Bill.—A special committee of the Sheffield City Council appointed to consider the Electricity Bill has presented a long report in which it states that while the Bill may prove helpful to smaller undertakings and areas where industry is not concentrated, it offers no present advantages to Sheffield. It will not assist Sheffield consumers to any degree, but will tend to increase the cost of electricity, the average price to consumers in 1925-26 being practically that which the Bill hopes to achieve in 1940. "For the year 1926-7 the average price in Sheffield will be still lower, and with an increasing sale will continually fall year by year, and by 1940 will, if Sheffield is left alone, be considerably nearer ½d. per unit than the 1d. per unit hoped for by the Bill." Stating its grounds of objection to the measure, the committee says: "The principle of taking at cost price the output of current of authorised undertakers without an obligation to take all their plant could produce, and returning the same to them at enhanced price, is unjust, and will add to the charges necessary to be made to manufacturers for cost of supply, and so increase the cost of producing goods and retard the consumption of electrical energy. No provision is made to expropriate power companies from areas where they are giving little or no supply and enabling local authorities which could give supply on better terms to do so." The committee recommends that it be authorised to take such steps as it thinks desirable to oppose the provisions of the Bill which it considers objectionable.

Electric Cooking in a Match Factory.—One of the latest converts to the electrical idea for cooking is the well-known firm of match manufacturers, Messrs. Bryant & May. Their model and extensive establishment at Bow has just been equipped with a number of standard "Magnet" appliances, the production of the General Electric Co., Ltd., and an excellent idea of the orderly arrangement which has been contrived with these appliances, without in any way impairing their individual efficiency or impeding easy access to them, is given by the photograph reproduced herewith. The adoption of electricity for cooking purposes is an obvious precautionary measure against fire in such a case as this, where materials of a highly inflammable nature are used in various processes of manufacture. Apart from this, there are advantages which have greatly impressed the kitchen staff and have facilitated the work of catering for from seven to eight hundred workers daily. Included in Messrs. Bryant & May's equipment is a large double-oven range, a roasting oven, a large boiling table, and a double-pan fish fryer. The range has open and enclosed boiling plates as well as a griller and toaster fitted into the hob table above the two ovens. A cabinet type roasting oven has been specially installed for roasting joints of meat, baking quantities of fruit tarts, &c. Its internal cooking space is 4 ft. 6 in. high, 2 ft. 9 in. wide, and 2 ft. 6 in. deep. The boiling table carries four 12 in. by 8 in. enclosed pattern plates, and two 12 in. by 8 in. open coil plates. The fish frying is carried out by means of two 18 in. by 18 in. by 6 in. special pattern open-coil fish fryers, mounted side by side on a stand to bring them to a convenient height from the ground for easy working.

"Magnet" Equipment at Bryant & May's.

Standardisation of Agricultural Motors in France.—At a recent meeting of the French Union des Syndicats d'Electricité (Paris) a special committee was appointed to consider the standardisation of electric motors for farm use, or at least to consider whether, with the object of encouraging the use of electricity in connection with agricultural operations, motors for such purposes should be made in standard sizes.

Steam Heating Developments at Winnipeg.—The *Electrical News* recently published an article upon the City of Winnipeg's combined steam stand-by and central steam-heating plant. The plant was originally designed as a stand-by plant for the municipal hydro-electric system, with a capacity of 11,000 kW to take care of the essential service under emergency conditions. It was not until after construction on the plant had commenced that it was decided to use the boiler plant of the stand-by station to supply steam for a central heating system, the decision being arrived at after a complete survey of the situation had been made. This showed that if a steam-heating system, operated on a paying basis, could be co-ordinated with the hydro-electric system and its stand-by plant, certain economies would be effected that would reduce considerably the cost of the plant to the hydro-electric system, and if large electrical steam boilers were installed, about 65,000,000 kWh of off-peak energy could be used annually during the heating season for generating steam for distribution. As the turbo-generators are likely to be called upon only during the summer months when the electrical and wind storms menace the transmission lines, the boiler plant may be used for steam-heating purposes and still be ready in case of emergency for supplying steam for the turbines when occasions necessitate.

The generators of steam for distribution are each of 7,500 kW capacity, 4,800 V, 3 phase, generating at 240 lb. per sq. in. These boilers are of Canadian General Electric design and consist of a vertical shell, composed of two compartments with a diaphragm between. A circulating pump, which regulates the load, pumps water from the lower chamber and discharges it into the upper one, which contains the electrodes. The water flowing back again passes through an opening in the bottom of the upper chamber and discharges towards a sediment pocket at the bottom of the lower chamber. The pump being of constant speed, the flow of water is controlled by a gate valve which regulates the height of water in the electrode chamber and consequently the depth of immersion of the electrodes, thereby determining the resistance which, in turn, governs the electrical input and the steam output. The electrodes are of special cast-iron composition, which resist corrosion and are designed to give a low-current density.

South African Notes.—Considerable progress is being made with the erection of the Witbank hydro-electric generating station, which is expected to be in commission in August next. The station is to be equipped with three 20,000-kW generating sets, and the stator of the first set, which weighs 47 tons, was recently delivered. The transmission lines from Witbank to Brakpan, a distance of 65 miles, are nearing completion. Six cables are being provided, three on each side of the standards; they are mounted on steel towers 100 ft. high and placed at intervals of 1,000 ft. The transmission pressure is to be 132,000 V.

According to the *Rand Daily Mail*, pourparlers are taking place with regard to the taking over of the Colenso power station from the South African Railways by the Electricity Supply Commission and £2,000,000 is mentioned as the sum involved. It is further suggested that the capital so released may be applied to the further electrification of the Durban-Maritzburg line. It is intended that the Colenso station, of 60,000 kW, should work in conjunction with the station at Durban, 40,000 kW, to supply the whole of the uphill railway section from the coast inland and to the municipalities and industries in the area.

Atomic Hydrogen Arc Welding.—Within the last year or two material progress appears to have been made in the laboratories of the General Electric Co., of America, in overcoming some of the difficulties associated with the electric arc-welding process, as a result of which it is now claimed that such welds can be made to withstand the most severe tests. The scientific side of the investigations is, in itself, most instructive and fascinating, being one more example of the inception of many important practical processes by research in pure science. For instance, Dr. Irving Langmuir's work has indicated that when hydrogen gas (ordinarily in the form of HH, or two atoms united to form a molecule) is highly heated, say to about 2,500 deg. C., the molecules are dissociated in a large part into free atoms. Such dissociation, however, demands the expenditure of a large amount of energy and the recombination of the dissociated atoms to form hydrogen again in the molecular state gives back that energy and produces a most intensely hot flame source. A stream of hydrogen directed into an arc between two tungsten electrodes can be made to produce a flame of atomic hydrogen which is of even higher temperature than the oxy-acetylene flame, and in the *General Electric Review* Dr. Langmuir describes in detail the results of his remarkable investigations, which finally led to the conclusion that flames of this gas make possible a new electric welding method of far-reaching importance. Another article, jointly written with Mr. R. A. Weinman, contains a comprehensive statement of the work which has been done in applying the atomic hydrogen arc to the fusing and welding of metals; it is also possible to use this agent of great utility for the reduction of many metallic oxides. The special welding torches and auxiliary apparatus, together with the distinctive character of the results obtained by the application of this principle are described, and the articles will repay careful reading.

Almost simultaneously with the work at Schenectady, Mr. P. Alexander was engaged upon welding research in the Thomson Research Laboratory of the G.E. Co. at West Lynn, which culminated in the establishment of the practical conditions for the production of reliable ductile welds by bathing, or shielding, ordinary electrodes with hydrogen gas, without necessitating any modification of the ordinary apparatus. The author, who worked partly under the direction of Dr. Elihu Thomson, shows that some other gases, or mixtures (which, on reaching the arc, become practically hydrogen and carbon monoxide), or vapours of some liquids, have serviceable properties in this respect. Both this process and that previously referred to produce highly ductile welds, but the equipment and welding technique are so different that each method will doubtless find a field of preferred application.

Petrol-Electric 'Buses in Argentina.—*Reuter's* Buenos Aires correspondent reports that a petrol-electric omnibus service has been instituted between the city and its principal suburbs. Forty Tilling-Stevens vehicles are providing the service and they are said to be well patronised.

High-Pressure Boilers.—In a paper on "High-Pressure Water-Tube Boilers for Marine Purposes," read before the Institution of Naval Architects, Mr. Harold E. Yarrow dealt briefly with some modern developments in high-pressure boilers. He said there should not be any difficulty in making high-pressure steam joints tight. The problem was simplified in marine installations where the valves and pipes were much smaller than was the case with land boilers. The 400-lb. steam pipe from each of the Yarrow boilers at the County of London Electric Supply Co.'s generating station at Barking was of 8 in. diameter and joined up to a 12-in. main line. In a steamship of 24,000 s.h.p., having six boilers of 575 lb. pressure, the diameters of the connecting and main pipes would be 4 in. and 7 in. respectively. The author described and illustrated two h.p., coal-fired boilers which will be installed on a passenger vessel now being built by Messrs. Wm. Denny & Bros. The boilers are being constructed for a working pressure of 575 lb. per sq. in., and the design closely follows that of the Yarrow land-type boiler now in use in several generating stations. A boiler suitable for 1,000-lb. pressure was illustrated, the boiler being of such a size as would produce steam for 4,000 shaft horse-power when worked at a very moderate rating.

E.A.W. Luncheon.—In connection with the first annual general meeting of the Electrical Association for Women, a luncheon is being held at the Criterion Restaurant, Piccadilly, London, W., on May 7th, at which the Rt. Hon. Lt.-Col. Wilfred Ashley, M.P., Minister of Transport, Miss Ellen Wilkinson, M.P., and Sir Hugo Hirst, Bart., have promised to speak. After the luncheon the members will visit the Zoological Gardens to see the new installation of artificial daylight. Application for tickets should be made before May 1st to the Director, Electrical Association for Women, 26, George Street, Hanover Square, London, W.

Textile Mill Drives.—Members of the Blackburn and District Managers' Mutual Association were addressed recently by Mr. P. P. Wheelwright, Blackburn electrical engineer, on the subject of "Electric Power and Driving." Mr. C. Tate (secretary of the Cotton Employers' Association), who presided, emphasised the rapid strides made in the development of electrical energy since the war. Electricity was being used more in connection with the manufacture of textiles than ever before, and actual experience would largely determine its future regarding the cotton industry. The sooner such difficulties as the sudden starting experienced with the electrical drive and the generation of heat to keep the weaving sheds at the right temperature were overcome, the more rapid would be the application of electricity to the industry. The chief consideration, however, was an economical one; at present, electricity rates did not appear to be sufficiently attractive to draw the industrial magnate.

Mr. P. P. Wheelwright said losses due to friction and windage in the mechanical transmission amounted to as much as 40, or even 50 per cent. when operating under full-load conditions, largely traceable to heavy shafting, defective gearing, belts, ropes, and pulleys, and were seldom accurately ascertained. The contrary was true of electrical transmission, provided due attention was paid to the lay-out of the plant at the time of its installation. It was now the exception for new mills to be built without such equipment, which testified that it must possess commercial, economical, and financial advantages. There were cases of electrically-driven mills in which the individual drive had been adopted where the increase in production in 12 months had been from 8 to 10 per cent., compared with a similar mill equipped with the same class of machinery and driven by an up-to-date engine. The cost of upkeep would not amount to more than a few pence per h.p. per annum to cover renewals to bearings, switchgear, &c. Steam would, of course, be required for heating and manufacturing processes, but all that was required was an inexpensive low-pressure boiler capable of withstanding a pressure not exceeding 20 lb. Mr. Wheelwright summed up the advantages of electricity as follows:—Flexibility, lighter building construction, sectional working, smoothness of drive, speed variation, reduction in breakdowns, ease of control and upkeep, increased light due to the reduction in the amount of overhead shafting, belting, &c., and improved welfare of *personnel*. Some of these advantages would substantially decrease the actual cost of driving the mill, whilst other advantages would beneficially influence its general operation, thereby effecting a high standard of production both with regard to quality and quantity.

A Ship's Progress Indicator.—One of the most interesting features of the world's largest motor ship, the *M.V. Asturias*, is the realistic and accurate moving model which gives the ship's location on the ocean at any part of the journey. The indicator was designed and constructed by Messrs. Gent and Co., Ltd., and consists of a large coloured relief map embracing both hemispheres and the sea route of the *Asturias* between Southampton and Buenos Aires. A small model ship, representing the liner, is moved along the route by concealed, electrically-controlled clockwork, the rate of travel of the model being in proportion to the actual speed of the vessel. Coloured lighting effects are provided to illuminate and give life to the map and simulate sunrise and sunset effects on the model. A simple switch control enables the model to be automatically reversed at the commencement of the return journey. The clock is controlled by a "Pul-Syn-Etic" marine transmitter installed in the chart room, and 40 clocks provided throughout the ship are arranged in the same circuit. The clock system and the model-ship mechanism are driven off the ship's lighting supply.

Fatality.—An inquest was held at Lewisham on April 7th into the cause of the death of George Frederick Peter Blackeman, aged 10 years, who received a fatal electric shock on the Southern Railway between Ravensbourne and Beckenham Hill stations on April 5th. It was stated that the boy was looking for flowers, and went over the line, coming into contact with the conductor rail. A verdict of "Accidental Death" was recorded.

Chief Technical Assistants' Association.—The 12th annual dinner of the above Association was held on April 10th at the Holborn Restaurant, Oxford Street, London, when Mr. G. F. Gregory presided, and was supported by a large number of well-known engineers. After the loyal toasts, Mr. J. A. Lee proposed "The Association and Chairman." Mr. Lee said the Association carried out most useful work at its meetings by the interchange of opinions on the various technical subjects of the electricity supply industry.

Mr. Thompson submitted "The Visitors," and was very disappointed because Mr. Lee had not expounded the new Electricity Bill. Like other Government officials Mr. Lee was very guarded in his remarks.

Mr. A. H. Shaw responded, and related several interesting incidents in connection with the industry 35 years ago. He paid a tribute to the chairman, who was his chief assistant at Ilford.

Mr. Cornet proposed "Mr. Wallis," who was leaving Wimbledon to take up an appointment at Bristol, and the latter gentleman responded in a suitable manner.

An excellent musical programme was provided under the direction of Mr. Percy Vaughan, and a vote of thanks to the officials and committee of the Association and the artistes concluded the evening.

Educational.—Faraday House Entrance Scholarships.—On the results of the entrance scholarship examination held at Faraday House Electrical Engineering College on April 7th, 8th and 9th, the following awards have been made by the Governors of the College:—Ernest M. Noble, Holborn Estate Grammar School, the "Faraday" scholarship of 50 guineas per annum, tenable for two years in College and one year in works; Charles B. Forgan, Roan School, Greenwich, the "Maxwell" scholarship of 50 guineas per annum; Ian J. Farmbrough, Stationers' Company's School, Hornsey, an exhibition of 40 guineas per annum; Richard P. E. Tabb, Haberdashers' Aske's Hampstead School, an exhibition of 30 guineas per annum; William R. Crookes, East Anglian School, Bury St. Edmunds, an exhibition of 30 guineas per annum, all tenable for one year in College and one year in works. Entrance prizes of ten guineas each were also awarded to John H. Bayton, The Nautical School, Pangbourne, and John C. McMahon, The King's School, Peterborough.

Extensions at Ilford.—On April 8th, a tour was made by a party of engineers, local and Press representatives of the sub-stations on the distribution system of the Ilford electricity undertaking, when the most recently established one at Gants Hill Cross was formally inaugurated by the Rev. Herbert Dunnico, M.P., J.P., chairman of the Municipal Council. This sub-station is of the fully-automatic type, the equipment having been supplied by the Metropolitan-Vickers Electrical Co., Ltd. It was put into operation in December last, the main object being to improve the pressure on the d.c. network in the neighbourhood. A feature of the "sub" is that, by means of a time-delay relay the converting plant is not disconnected from the distribution system until 20 minutes after the supply pressure rises above the set value, thus allowing for any temporary drop of load. The necessary conversion from the 6,600-V, 3-phase system is effected by means of a 500-kW rotary converter fed from a 550-kVA transformer. The sub-stations at Uphall Road, Grove Road, and Goodmayes were also visited, and an inspection was made of the transformer kiosk which furnishes an a.c. supply to the Tomswood Hill Housing Estate. The kiosk was supplied by Messrs. Callender's Cable & Construction Co., Ltd. It is a steel structure, about 8 ft. square, and houses a 100-kVA Fuller transformer and the necessary switchgear for receiving and distributing the e.h.p. and l.p. supplies. The Uphall Road sub-station receives a bulk supply from West Ham, and is equipped with two 1,000-kW La Cour converters, one by Messrs. Bruce Peebles, Ltd., and the other by Messrs. A.C.E.C., and switchgear by the General Electric Co., Ltd.

The party was entertained to tea in the Ilford Town Hall after the inspection, when Councillor H. G. Odell, chairman of the Ilford Electricity Committee, called upon the Rev. Dunnico to declare the sub-stations open for the benefit of the ratepayers. Councillor Odell outlined the progress made by the undertaking since its commencement 25 years ago. He warned the public not to expect any immediate material reduction in the price of electricity as the result of the Government Electricity (Supply) Bill. Tributes were paid to Mr. A. H. Shaw, M.I.E.E., who had been the engineer and manager of the undertaking during the whole of its 25 years of operation.

Institution Notes.

Royal Institution.—The After-Easter Lectures will include three lectures by Dr. G. W. C. Kaye on the "Acoustics of Public Buildings" (the Tyndall Lectures), on May 11th, 18th and 25th; three by Sir William Bragg on the "Imperfect Crystallisation of Common Things"; and two by Mr. U. R. Evans on the "Corrosion, Tarnishing and Tinting of Metals." On Saturdays, May 15th and 22nd, there will be two lectures by Dr. G. C. Simpson on "Atmospheric Electricity." The Friday evening discourses will include one by Dr. R. Whiddington on "The Luminous Discharge Through Rare Gases" (April 23rd), and one by Dr. W. H. Eccles on "Wireless in the Empire" (April 30th).

Institute of Marine Engineers (Inc.).—The annual meeting of the above Institute was held on April 9th, when the annual report was presented; the Rt. Hon. Lord Inverforth, P.C., president of the Institute, presided. The total membership on January 31st, 1926, was 2,905, representing an increase of 22 on the number for the previous year. The revenue account for the year shows a profit of £796, as compared with £1,021 for the previous year, and the gross revenue was £5,038, representing a decrease of £148 from the corresponding figure for the past year.

Iron and Steel Institute.—The annual meeting of the Institute will be held at the Institution of Civil Engineers, Great George Street, Westminster, on May 6th and 7th next. Amongst the papers to be read are: "Specific Resistance and Thermoelectro-motive Potential of Some Steels Differing in Carbon Content," by Messrs. C. D. Campbell and H. W. Mohr; "Magnetic Changes in Iron and Steel Below 400 deg. C.," by Messrs. W. H. Dearden and C. Benedicks; and "The Hardening and Tempering of High-Speed Steel," by Mr. A. R. Page. The autumn meeting of the Institute will be held at Stockholm on August 26th-28th, when, besides the reading and discussion of papers, visits to industrial enterprises in Stockholm will take place.

The Institute of Metals.—Some preliminary details of the annual autumn meeting which is to be held in Liége from September 1st to 4th have been announced. It is provisionally arranged that the party will leave London at 9.15 a.m. on August 31st, arriving at Liége at 7.45 p.m., and return on September 5th. If at least 50 members desire to travel together special arrangements will be made for an inclusive fare, which will not exceed £10, and will provide the necessary travel tickets and hotel accommodation at Liége. This meeting will be the first to be held on the Continent since the very successful Ghent Meeting of 1913.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

MR. W. J. MAXFIELD has resigned his position with Messrs. J. H. Tucker & Co., Ltd., and has joined the Austin Motor Co., Ltd.

MR. L. J. B. FORBES, electrical engineer at the Kirk Sandall Glass Works of Pilkington Bros., Ltd., has been appointed electrical engineer at the firm's head works at St. Helens.

MR. C. BATT, late superintendent of telegraphs at Bournemouth, who has retired, was on April 7th presented with an inlaid mahogany table and a case of pipes by the staff.

MR. J. G. MCLEAN, who for the last 14 years has been agent and superintending engineer in the North Midland and N.E. Coast of England for Messrs. Edward Bennis & Co., Ltd., has severed his connection with the company, and now represents the Crosthwaite Engineering and Furnace Co., Ltd., of Leeds. Mr. McLean was chief engineer and genera manager of the Woking Electric Supply Co., Ltd., 1900-1911

DR. HENRY R. WRIGHT, the newly-appointed managing director of Siemens Bros. & Co., Ltd., who has been a director of Siemens & English Electric Lamp Co., Ltd., since January 1st, 1923, has been appointed managing director of the company, and Mr. S. H. CALLOW, the sales manager, has been appointed a director.

MISS VARA M. BROOKE, elder daughter of Mr. W. A. Brooke, of Framfield, was recently married at Altrincham to Mr. ERNEST THEODORE WRIGHT, principal electrical engineer at the Manchester offices of the Traction Control Euipment, and for some years previously, on the staff of the Metropolitan-Vickers Electrical Co., Ltd., at Trafford Park.

The Birkenhead electrical engineer, Mr. G. P. SHALLCROSS, was spoken of very highly at a meeting of the Town Council a few days ago, when his impending retirement was discussed. After a long discussion regarding the appointment of a successor, Mr. F. E. SPENCER, A.M.I.E.E., the present assistant engineer, secured the position at a salary of £750 a year for a period of 12 months commencing on the date of the retirement of Mr. Shallcross.

At the Grand Hotel, Manchester, on April 7th, a dinner (followed by a concert) was given by the members of the staff of the Lancashire Dynamo & Motor Co. to welcome Mr. A. P. WOOD, the managing director, on his recent return from India. Mr. H. B. Whitmore, in toasting the honoured guest, spoke of the high esteem in which their chief was held by the staff and employés, also by engineers, clients and others in practically all parts of the world. Mr. A. P. Wood, in reply, referred to the close co-operation that he had always had from his assistants, which had established the company in the sound position and with the high reputation which it enjoyed to-day. He had done extensive business in India, securing some valuable contracts.

Mr. FRANK W. T. BRADLEY, sub-station engineer to the Durban Corporation, upon returning to South Africa, asks us to thank the many engineering friends for the courtesy and kindness shown him during his recent visit to England.

Mr. Z. S. MC. P. JACKSON, representative of the Mullard Wireless Service Co., Ltd., Balham, who has been recalled from the West of England to undertake important business for the company in Australia, left London on March 18th, and will arrive at Sydney on April 22nd.

Indian Engineering understands that Mr. W. F. MARCHINTON, industrial engineer, has been appointed electrical engineer to the Government of Bihar and Orissa.

The Yorkshire Electric Transformer Co., Ltd., have appointed Mr. G. F. STEARN, late of the Metropolitan-Vickers Co., and at present with the English Electric Co., Ltd., as their chief designer.

Obituary.—MR. G. H. COTTAM.—Mr. George Henry Cottam, who passed away on April 1st at Coulsdon, Surrey, was in his 76th year. After some sixteen years in connection with general engineering, he took up, in 1882, the study of electricity; subsequently he worked for the Faure Electric Accumulator Co., the Anglo-Austrian Brush Co. (in Vienna), and superintended the erection of electrical undertakings in Hungary. Electric light and traction work in Spain was followed by duty at the Bankside generating station of the City of London Electric Lighting Co., Ltd., on behalf of the Brush Co., the contractors; and in 1893 Mr. Cottam superintended the erection of the Hanley Corporation electricity works and became electrical engineer to that municipality. Two years later he took up the position of chief electrical engineer to the Hampstead Borough Council. He was a life member of the Institution of Electrical Engineers, which he joined in 1895.

M. A. PEROT.—The death is reported from Paris, at the age of 62 years, of M. Alfred Perot, Professor of Physics at the Ecole Polytechnique. The deceased had read many papers before the French Institution of Electricians, and was well known for his work on relativity and the electro-magnet.

MR. H. OPPENHEIMER.—We regret to learn, at the moment of going to press, that Mr. H. Oppenheimer, of the Phœnix Telephone & Electric Works, Ltd., passed away on Monday last in his 70th year.

New Companies Registered.

T. H. Satchwell, Ltd. (213,046).—Private company. Registered April 8th. Capital, £3,000 in £1 shares. Objects:—To acquire the business of a manufacturer and factor of electrical conduits, fittings, and accessories carried on by T. H. Satchwell at 143, Bridgeman Street, Walsall, as elsewhere, as "T. H. Satchwell." The permanent directors are:—T. H. Satchwell (managing director), 10, Caldmere Road, Walsall; W. S. Glover, 17, Brighton Grove, Monkseaton, Northumberland. Qualification, 100 shares. Solicitor: F. T. Craddock, 15, Bridge Street, Walsall. Registered office: 143, Bridgeman Street, Walsall.

Deansgate Electro Radio (Manchester), Ltd. (212,955).—Private company. Registered April 3rd. Capital, £2,000 in £1 shares. Objects:—To acquire and carry on the business of wireless, electrical and incandescent importers and dealers carried on by K. F. Fritzsche at 14, Hanover Street, Shudehill, Manchester, as "I. L. Radio Supplies." The permanent directors are:—C. Leeming, 10, Merton Road, Cheadle Heath, near Manchester, accountant; K. F. Fritzsche, 52, Seymour Grove, Old Trafford, Manchester, wireless dealer. Qualification, £50.

Rushmer, Ltd. (213,008).—Private company. Registered April 6th. Capital, £2,000 in £1 shares. Objects:—To carry on the business of furnishing and general warehousemen, and manufacturers of and dealers in furniture in all its branches. Power is taken to carry on the business of general, electrical and motor engineers and contractors, suppliers of electricity, carriers of passengers and goods, manufacturers of and dealers in railway and tramway appliances, radio apparatus, electrical signs, heating and cooking appliances, and all kinds of mechanical and electrical machines, &c. The directors are:—W. E. Livingston, 80, Norry Road, Putney, S.W.15, contractor; Mrs. A. A. Livingston, 80, Norry Road, Putney, S.W.15; R. E. B. Trever, address not stated. Qualification, 100 shares. Solicitors: White, Davison and Co., 61-62, Chancery Lane, W.C. Registered office: Rushmer's Warehouse, Ruvigny Gardens, Lower Richmond Road, S.W.15.

Express Radio Co., Ltd. (212,931).—Private company. Registered April 3rd. Capital, £1,000 in £1 shares. Objects:—To carry on the business of radio and electrical engineers and makers, manufacturers of and dealers in all kinds of wireless and electrical apparatus, &c. The life directors are:—H. H. Cowley, 12, Portsdown Road, Maida Vale, W., radio engineer (managing director); J. H. Watkins, 5, Challoner Court, Challoner Street, West Kensington, W.14, journalist. Solicitors: George H. Olley and Co., 11, Queen Victoria Street, E.C.4. Registered office: 66, High Holborn, W.C.1.

Official Returns of Electrical Companies.

Energo Products, Ltd.—S. G. Crimes, of 150, Southampton Row, W.C.1, was appointed receiver and manager on March 30th, under powers contained in debenture dated February 22nd, 1926.

Peerless Productions, Ltd.—S. Sharpe, of Balfour House, Finsbury Pavement, E.C., was appointed receiver and manager on March 15th, under powers contained in debenture dated February 3rd, 1926.

Ross Electric Light and Power Co., Ltd.—Particulars filed on March 30th, 1926, of £1,450 second debentures authorised July 30th, 1925, charged on the company's present and unissued capital, the whole amount being now issued.

China and Japan Telephone and Electric Co., Ltd.—Satisfaction in full on February 27th, 1926, of 7 per cent. first mortgage debentures secured by a floating charge and issued on December 22nd, 1905, January 24th, 1906, and November 1st, 1922, securing £50,000.

McLeod & Sons, Ltd.—G. Miller, I.A., 19, Castle Street, Liverpool, was appointed receiver and manager on March 22nd, 1926, under powers contained in debenture dated December 29th, 1924.

A. and A. Electrical Co., Ltd.—G. E. Sendell, of 36, Walbrook, E.C.4, ceased to act as receiver or manager on March 31st, 1926.

Vio Ray Electric Co., Ltd. (178,937).—Capital, £1,000 in £1 shares. Return dated December 31st, 1925. 377 shares taken up. £377 paid. Mortgages and charges, nil.

Hamilton Bros., Ltd.—H. Lever, F.C.A., of Chiswell House, Finsbury Pavement, E.C.2, ceased to act as receiver or manager on March 31st, 1926.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

A. Reyrolle and Co., Ltd.

This company's report was reviewed in our last issue (p. 591). Mr. William Negus (vice-chairman) presided at the annual meeting at Newcastle-on-Tyne on April 9th, and during the course of his speech mentioned that the share capital had been increased by £60,000, while the creditors had been reduced by £35,000. The employés' deposits were still increasing—a very satisfactory feature, and the general reserve had been substantially increased. The expenditure

upon extensions to stores and additional machine tool equipment amounted to £43,555 during 1925. The work completed during the year was larger than in 1924, and the exports of the company's manufactures continued to increase. During the last few years the company had carried out in a very successful manner a larger proportion of the heavy switchgear installed in this country than any other maker. Recent large extensions, which nearly doubled the area of the shops, had placed the company in a favourable position to meet the greatly increased demand for switchgear which was to be expected in the near future on account of the rapidly growing demand for electricity. The company had an excellent reputation for the reliability and modernity of its appliances. Such a reputation was only obtained by the skill, hard work, and ability of everybody connected with the company, and the shareholders' thanks were due to the staff. The recreation ground for the employés was now completed; the number of shares held by employés continued to increase, showing their interest in the company. Referring to the Government's Electricity Bill, Mr. Negus said that he considered that the intention of the Government to endeavour to co-ordinate the business of electricity supply and convert it from a parochial to a national institution must ultimately lead to beneficial results for the country and industry. The report and accounts were adopted, and the sum of £750 was voted to local charitable and other funds.

Vickers, Ltd.

The report for 1925 shows a profit of £420,973. After paying the preference dividends a balance of £18,275 remains, and this, together with £172,500 from the last accounts, is carried forward. The directors do not recommend a dividend on the ordinary shares. The report records the resignations of five directors. The committee of advisers and shareholders has issued its report, and makes the following recommendations:—That the office of "president" be established, carrying with it membership of the board of directors and each of the management boards, and that Mr. Douglas Vickers should be appointed to the position. That the board should consist of Gen. Sir A. H. Lawrence (chairman), Sir David Yule, Bart., Sir Edmund Wyldbore Smith, Mr. G. R. T. Taylor, Mr. M. W. Jenkinson, Sir Vincent Caillard, Sir A. Trevor Dawson, Bart., Commander C. W. Craven, Sir George Buckham, and Mr. Vincent C. Vickers. The Committee further recommends that the following boards should be constituted:—Industrial Management Board: Mr. M. B. U. Dewar, Mr. B. D. F. Docker, Sir Philip A. M. Nash, Mr. W. F. Sadler, Mr. A. Spencer, and Mr. T. L. Taylor. Armaments and Shipbuilding Management Board: Sir G. Buckham, Commander Craven, Sir A. Trevor Dawson, and Mr. O. H. D. Vickers. Finance Management Board: Sir Vincent Caillard, Mr. V. C. Vickers, and Mr. A. Cartwright. The board has adopted these recommendations, and has appointed as additional members to the management boards Sir E. W. Smith, Sir D. Yule, Bart., and Messrs. M. W. Jenkinson and G. R. T. Taylor. Mr. F. Dudley Docker has agreed for the time being to act as an honorary member of the Industrial Management Board. The whole of the directors were to retire and offer themselves for re-election at the annual meeting at Sheffield yesterday (Thursday).

Automatic Telephone Manufacturing Co., Ltd.

The annual meeting of the company was held on April 7th under the chairmanship of Sir Alexander Roger. The latter, in presenting the report and accounts (*vide* Elec. Rev., April 2nd, p. 550), said that the business done during 1925 was larger than in any previous year, and as a result the profit had greatly increased. They had acquired additional factory premises at which it was proposed to accommodate certain of their non-telephone activities, such as the manufacture of heating and cooking appliances, and signal and telegraph apparatus. Those premises should be in complete operation by June, and should materially help the company's production. The company continued to have available for consultation the resources of the Strowger Automatic Co., of Chicago. The Post Office was proceeding actively with its policy of introducing the Strowger system into London and the provinces. The programme of development which had been adopted by the Post Office, if carried through undisturbed, would provide in reasonable time adequate service at minimum cost. In addition to three main exchanges in London, the company was installing auxiliary call indicator equipment in no fewer than 77 manual exchanges in Greater London. During 1925 A.T.M. (Strowger) exchanges were manufactured and installed at Cwmbran, Risca, Headingley, Stanningley, Chapeltown, Roundhay, Torquay, and Paignton; in addition, the company was engaged on the work for Nottingham and Southport. Their overseas operations were mainly confined to Tokyo, Sydney, and Buenos Aires, and the work on those three great contracts was materially advanced. The company had secured the contract for installing telephones in Canberra, the Federal capital of Australia, and at Elsternwick, Australia. The heating and cooking appliance section of the business was steadily expanding, and further growth was expected. The radio trade was quiescent, and they had regulated their output and stocks accordingly. The technical education of university graduates and electrical engineers undertaken by the company continued to produce good results, and the research department was proving of great value to the company. The welfare of the employés was being studied, and it was hoped that a scheme for a club, sports grounds, &c., would be carried through. Their pension fund provided liberal benefits. The Telephone Development Association, in which the company took an active part, reported definite progress. A large part of the prosperity of the United States was attributed to the telephones, and our Government should bear this in mind and not begrudge money spent on telephone development. The company's prospects were good; its present contracts alone would keep it busy for a year or more.

International Automatic Telephone Co., Ltd.

Sir Alexander Roger presided at the annual meeting on April 8th, and in moving the adoption of the report, reviewed the activities and financial results of the Automatic Telephone Mfg. Co., Ltd., a report of whose meeting appears above. The chairman said that allowing nothing for patent rights and goodwill, the value of the investments at the end of the year showed that the company's capital was intact. The company was engaged mainly in the development of the A.T.M. (Strowger) system in the foreign field and had succeeded in obtaining substantial business in all parts of the world. Many foreign telephone administrations were tending to follow the example of the British Post Office in installing the system and the directors had every faith in the future. Referring to the activities of the Telephone Development Association, Sir Alexander said that for every million pounds expended in telephone work employment was found for 6,000 workpeople, and the technical equipment of the country was improved. In conclusion, he stated that Mr. G. W. Moore, manager of the Automatic Telephone Mfg. Co., Ltd., had joined the board of the company.

United States Companies.

General Electric Co.—Although there was an increase in the value of orders received during 1925, the net sales fell from $299,251,869 to $290,290,165, and the net earnings from $39,235,548 to $38,641,217. The earnings on the average amount of special stock ($28,926,266) were at the rate of 137.07 per cent., as compared with 196.93 per cent. on an average of $19,756,000 of special stock in 1924.

Standard Gas and Electric Co.—It is reported that the company has acquired a controlling interest in the Philadelphia Co. (Pittsburgh) and the Market Street Railway Co. (San Francisco). This brings the company's gross earnings up to over $137 millions per annum, and its combined assets to about $750 millions.

Associated Electric Co.—As a result of the amalgamation of the electrical properties of the Associated Gas and Electric Co. and the properties of the Pennsylvania Electric Corporation, an offer was recently made in New York, and greatly over-subscribed, of $65,000,000 of the company's convertible 5½ per cent. gold bonds, due 1946, at 95½ per cent. These carry the option of conversion into 6 per cent. preferred stock of the Associated Gas and Electric Co.

Babcock and Wilcox, Ltd.

The directors' report for 1925 records a net profit of £785,027, and to this is added £197,395 brought forward, making £982,422. The interim dividends absorbed £222,359, and after paying the final preference shares it is proposed to pay a dividend of 5 per cent. and a bonus of 3 per cent., both free of tax, on the ordinary shares, making a total distribution of 13 per cent., free of tax, for the year. There remains a balance of £408,774, which is to be dealt with as follows:—To reserve fund, £150,000 (making £550,000); to dividend equalisation fund, £50,000 (making £400,000); to staff pension fund, £20,000; carried forward, £188,774. The report states that the works are well supplied with orders, including several for boilers of high pressure, and additional buildings designed to meet this special work have been erected. Judging by the orders received during the first three months of the current year, there are indications of an improvement in trade, and it is hoped that labour troubles will not retard the recovery. It is stated that the additional 1 per cent. on the bonus has been rendered possible by the reduction of taxation. The meeting is to be held on April 20th.

English Electric Co., Ltd.

The report for the past year shows a balance to the credit of profit and loss of £268,870 (including £73,917 brought forward). After deducting debenture interest, preference dividend, &c., there remains a balance of £74,098, which it is recommended shall be carried forward. The directors state that their inability to declare an ordinary dividend is due to the depression of prices by acute competition; the reduction of orders owing to the unsettled conditions of certain foreign markets; and lower royalties and dividends from allied companies. An outstanding feature of the company's business at the present time is the fact that the unexecuted orders on its books exceed the whole output of last year. During the last few months there has been an appreciable stiffening of Continental prices for the types of plant with which the company is most concerned. Mr. Pybus proceeded on sick leave in July last, and Mr. Watlington has joined the board as managing director. The meeting is to be held on April 21st.

Mexborough and Swinton Tramways Co.—The accounts for the past year show a balance to credit of net revenue account of £10,892, and a balance of £772 brought forward makes available £11,634. After providing for depreciation, income tax, and a loss of £452 on the motor omnibuses, it is proposed to pay a dividend of 2 per cent., free of tax, to

transfer £4,000 to reserve and renewals account, and to carry £1,460 forward. The company is promoting a Parliamentary Bill to empower it to connect the railless traction systems in Manvers Main and Conisborough, to extend the system in the latter district, and to authorise the company, if thought fit, to take up the tramway track in Mexborough, over which the new system would be operated. The report records the death of Ald. D. L. Winter, a director. Meeting: April 21st.

Northampton Electric Light and Power Co., Ltd.—An extraordinary general meeting has been called for April 21st to consider a resolution to increase the company's capital to £500,000 by the creation of 150,000 additional "B" shares of £1 each to be issued either as ordinary or preference shares, ranking with the existing preference shares, or with or subject to other rights, privileges, or conditions. The directors propose to issue 70,000 of these to existing holders of "B" ordinary shares in the proportion of one to five at the price of 27s. per share, representing a substantial bonus.

Calcutta Electric Supply Corporation, Ltd.—An issue of 150,000 each of preference and ordinary shares, ranking with the existing shares, is being made. The preference shares have been purchased at par by Messrs. Robert Fleming and Co., while the ordinary are being offered to present holders of ordinary shares at £1 13s. each, in the ratio of one new share to each eight held. The capital is required for the completion of the new power station at the Calcutta docks and for general improvements and extensions.

Peterborough Electric Traction Co., Ltd.—The accounts for 1925 show a revenue of £33,238, an increase of £7,029, and expenses amounting to £29,729 (including £5,500 transferred to renewal fund), leaving a balance of £3,508, to which is added £1,020 brought forward, making £4,528. A dividend of 5 per cent. is recommended, leaving £2,209 to be carried forward.

Reduction of Capital.—Siebe, Gorman & Co., Ltd., and Reduced.—A petition has been presented to the High Court for the confirmation of the reduction of capital of the company from £100,000 to £75,000, and will be heard in London on April 20th. (The grounds of the petition are that the company's paid-up capital is in excess of the wants of the company.)

Wood & Cairns, Ltd.—The directors recommend a dividend of 10 per cent. on both the preference and ordinary shares for the year ended December 31st, 1925. The sum of £818 is placed to reserve, and £487 is carried forward.

Stock Exchange Notice.—Dealings in the following have been specially allowed by the Committee under Rule 159:—

River Plate Electricity Co.—34,701 new ordinary shares of £1 each fully paid, Nos. 347,014 to 381,714, and fractional certificatees (registered).

Anglo-American Telegraph Co., Ltd.—Interim dividends of 15s. per cent. on the ordinary stock and 30s. per cent. on preferred stock, have been declared in respect of the quarter ended March 31st.

Dutch Company.—The accounts of the *Nederlandsche Kabelfabriek* for 1925 are reported to show net profits of 833,000 florins on a paid up capital of 2,500,000 fl. It is proposed to pay a dividend at the rate of 21 per cent.

Greek Company.—The report of the *Société Hellenique d'Electricité*, Athens, for last year, shows a net profit of 3,807,558 drachmae (about £10,290), as compared with 3,563,447 drachmae in 1924.

La Plata Electric Tramways Co., Ltd.—Out of the profits of the past year it is proposed to pay 6 per cent. on the preference shares, to transfer £5,000 to reserve, and to carry forward £3,958.

Brazilian Traction, Light and Power Co., Ltd.—A dividend of 1¼ per cent., payable June 1st, has been declared on the ordinary stock.

Oliver Pell Control, Ltd.—The directors recommend a final dividend of 5 per cent. on the preferred and ordinary shares, making 10 per cent. for the year in each case.

Hadfields, Ltd.—A dividend of 3 per cent. is recommended, as against 2½ per cent. for 1924.

Stocks and Shares.

Monday Morning.

The critical conditions surrounding the coal question constitute the chief factor that controls Stock Exchange business at the present time. That hopefulness is felt in regard to the outlook can be clearly seen from the manner in which prices are maintained. If it were generally supposed that a widespread strike were likely to occur, we should see Stock Exchange markets in a very parlous condition. Whereas, although it cannot be said that anything approaching activity prevails, comparative firmness in prices is noticeable, and this, not only in the general markets, but also in those the companies concerned with which are peculiarly liable to be affected by acute industrial trouble.

Electricity supply shares, as well as the gas companies' stocks, hold their ground with a tenacity which shows the faith reposed in them by proprietors of these investments. In regard to the electricity shares, these are also under the influence of the discussions that surround the Electricity Supply Bill, which enters upon its committee stage immediately. That some hesitation continues to be felt by shareholders is manifest from a further fall in County of London ordinary to 56s., making a drop of 3s. within the last fortnight. County shares are more vulnerable than others in the list, from the fact of their commanding a ready market, and therefore attracting the speculative investor who regards the shares from both points of view. The Bournemouth and Poole Company has declared a final dividend on the ordinary shares of 5½ per cent., less tax, making 10 per cent. for the year, plus a bonus of 4 per cent., free of tax. This is the same rate as was declared for 1924. A fall of 1/16th in Metropolitans lowered the price to 37s. Edmundsons are easier at 23s. In the Provincial list, small declines have taken place in Midland Counties to 19s. 6d., and in Newcastle ordinary to 22s. On the other hand, Yorkshire Electrics at 26s. 6d. are a better market.

The Calcutta Electric Supply Corporation is offering new shares at 33s., and as the existing shares stand in the market at 38s. 9d. ex rights, the privilege is substantial, and there is a premium of 3s. per share on the new. The rights can be sold, if desired, without the necessity of holders taking them up. We have frequently drawn attention to the danger that arises too often in cases such as this when new issues are made at bonus prices. In a company the shareholders of which are mostly of the investment class, people are liable to throw away circulars and other notices if these contain invitations to subscribe more capital. In every case the offers are worth examination with a view to seeing whether the rights can be sold, as in the case of the Calcutta Electric at a profit.

The Canadian General Electric report mentions that the company has been able to redeem five million dollars debentures, thereby fortifying its financial position. The net profits have risen from $578,000 to $934,000. It will be remembered that the General Electric Co. of America holds the bulk of the Canadian company's ordinary capital. The common stock of the Canadian company is quoted at 52½ for the $50 shares. The preferred stock, which is also in $50 shares, stands at about 58½.

No check has yet been imposed upon the buoyancy of the market in Underground Electric Railways of London. The £10 shares are a further 2s. 6d. better, and stand at 3⅜, against £3 before Easter, while the 1s. shares are up to 11s., the Income Bonds remaining at 100. While other Home Railway stocks are weak by reason of the coal affair, Underground Electrics stand out the more conspicuously with strength. Metropolitans are ½ down at 66, and Districts retain their rise at 50.

Anglo-Argentine Tramways have recovered, the first preference to 3, the seconds to 2⅝, upon vague statements to the effect that the Buenos Aires Municipality is on the point of implementing the agreement previously proposed between itself and the company. Brazilian Tractions rose $2 to 93. The quarterly dividend is 1¼ per cent., and, although some people had been expecting an improvement to 1½ per cent.—that is, at the rate of 6 per cent. per annum—the impression prevails that it cannot be long before this latter rate is distributed, provided the company's earnings continue to expand at their present satisfactory rate. The London Traction issues are unchanged, and in Mexicans there is little or nothing doing. British Electric Traction ordinary is 5 points higher at 127½, upon anticipations of an increase in the dividend.

Babcock & Wilcox have issued an exceedingly good report, and the previous dividend of 12 per cent. has been increased by 1 per cent. Some people had been expecting, however, that the company would pay 15 per cent. for the year, and the first effect of the announcement was a slight decline in price to 53s., this being recovered later. The quotation is now 53s. 9d., and in the face of the heaviness apparent amongst iron and steel shares as a whole, the firmness of Babcocks attracts the greater attention.

General Electrics are easier at 30s. Electric Constructions have gone back to 31s. 3d. English Electrics, after their sharp drop from 18s. 9d. to 14s. 6d., rallied to 15s., but could not hold the recovery. There is a good deal doing in the shares. Amongst other manufacturing descriptions, the tone keeps steady without there being any noticeable alteration in prices. The rubber share market has been dull, owing to a further decline in the price of the commodity. Experts talk about a probable shortage in raw rubber that may occur in 1928, but this prospect holds no consolation for those people who bought more shares in 1925 than they now know how to finance.

In the wireless group, Radio Common have recovered to 7¼, the preferred to 9¼, upon a rally in most of the dollar stocks and shares. Marconis are quiescent at 23s. 9d., and Canadians continue at 4s. 3d. Amongst the wireless manufacturing shares a slight demand for Burndept preferred caused the price to strengthen, though apart from this the movements are uninteresting.

The annual report of the Stock Exchange indicates that the House spent, in the year ended March 25th last, £4,729 upon "electric power, working expenses, and maintenance." This goes against £9,259 in the previous year when, however, special expenditure was incurred through the establishment of plant, &c. It will interest cricketers to know that the Surrey County Cricket Club's bill came to no more than £36 0s. 4d. last year for gas and electric light. The club's revenue account shows the charge to be seven shillings less than that debited for the same item in 1924.

Glasgow and the Electricity Bill.—Mr. Sam Mavor, at Glasgow Chamber of Commerce, reporting for a Committee upon the Electricity Bill, said that they were all agreed that the aims of the Bill were, in principle, sound. Those were the co-ordinating and standardising of electricity supply and distribution and the reducing of costs; but there were divided opinions as to the methods by which these aims were to be achieved. The dominating feature of the Bill appeared to be that the Central Board should have powers not only to control the generation and transmission of electricity, but also to own and operate the generating stations. That amounted to giving power to the Board to nationalise the whole scheme of generating and supplying electricity. The intention of exercising these powers of ownership was disclaimed. If it was not intended that the Board should operate them, it was highly dangerous to confer such powers upon it. The autocratic character of the powers conferred upon the Commissioners was a matter for serious consideration. So far as Glasgow and its neighbourhood were concerned, the Bill—if it were to go through—would have little effect with regard to the reduction of electricity charges; in fact, the result might be on the other side, although they had no reason to contemplate that. The great advantage of the Bill would be to the smaller manufacturing towns, which were at present supplied by inefficient generating stations and were paying prices for electricity very much higher than they would pay under the national scheme. On general grounds, if the scheme was to be of national advantage, it did not seem that corporations such as that of Glasgow, or any large power companies, should put obstacles in the way of measures which reasonably safeguarded their interests.

Electrical Notes from New Zealand.

(From Our Correspondent at Wellington.)

Power Boards Conference.

The second annual conference of New Zealand's Power Boards was held at Dunedin on January 28th and 29th, and was presided over by Mr. J. Nash, M.P., president of the Power Boards Association. Delegates were present from most of the 40 Power Boards already in existence, and matters relating to the retailing of power were discussed. The Power Board system may be considered to be on its trial, and a very heavy responsibility devolves upon it in the handling of the immense developments at present being carried out. Over 70 per cent. of the country is now under Power Board control, and practically three-fifths of the population of 1,340,000 depends upon the Boards for power supplies, and for the general maintenance and safety of the many miles of h.p. lines being erected throughout the country. It is only recently that the Government has passed on to the Power Boards full responsibility in connection with the retail end of the general power scheme and with it the responsibility for accidents, &c., arising through faults, leakages or breaks in the distribution system outside the Government's main transmission scheme between the power plants and the Boards' sub-stations. This matter of responsibility for accidents, &c., was discussed at the recent conference and it was unanimously resolved that the matter be further taken up with the Government which is now framing important regulations covering the point. A resolution passed at the conference proposed that in the event of the Government's demanding periodical inspections of all electrical installations the cost should be borne by the consumers, and that the supply authorities should not be held responsible for any accident which might occur from defects subsequently occurring and over which the supply authorities had no control. Another important point brought up during the conference was the disparity in repair costs in different areas, and the assistance of the engineers employed under the various Boards is to be obtained in drafting a set scale of charges in this connection. The guarantee of revenue to the Boards before carrying out distribution work was discussed. The Public Works Department in its schemes has demanded 20 per cent. of the capital cost as a guarantee, and this policy was generally approved by the conference, and it was further agreed that 12½ per cent. should be accepted as a sufficient sum to warrant the extension of any existing circuit. The great demand for electric ranges and other electric cooking appliances was commented upon, and it was suggested that arrangements would probably have to be made to cope with the ever-increasing demand in a much broader manner than at present. Bulk importation was proposed, and it would seem that some such arrangement will soon have to be inaugurated not only for cooking appliances but for farm machinery as well.

Power for Horowhenua.

The recently constituted Horowhenua Power Board is one of the most favourably situated of the forty Boards in operation being closely situated to the Mangahao power station. The district is traversed by the Main Trunk Railway line, and along the line are some forty definite settlements and a number of enterprising and growing towns. The total population of the Board's area is 12,000. The original supply of power from the Government station at Mangahao commenced in November, 1924, a capital outlay of £117,321 being involved in the Board's distribution network, &c. As against this, revenue to the end of 1925 approximated £5,000 on only a small percentage of consumption. Since these figures were recorded, consumption has increased markedly, and the revenue figures for the next year of working, it is estimated, will result in a substantial profit to the Board. One of the recent developments in connection with the Horowhenua Power Board's operations is the electrification of Foxton Harbour lights, and the change from oil to electricity in the new port light at Manawatu Heads. This latter light will be of material assistance to mariners on the west coast, as it is visible for some 15 miles and is within range of the coastal shipping between Wanganui and Wellington. The various flax-milling industries in the Tokomaru Flax Swamp district have decided to inaugurate a scheme for doing most of their power working at such times as will relieve the peak load on the Board's installation. This will enable the Board to dispose of the greater proportion of its power to greatest advantage. A suggestion is also made that the Horowhenua County Council shall do all its metal crushing work at night time, thus spreading the power service more equitably over the 24-hour period. Already Horowhenua requirements are exceeding the estimated demand; a portion of the increased demand is from the farming community, which is installing milking machines and other electrically-driven devices at a rapid rate.

The Quality of Electrical Goods.

The rapid development of hydro-electric power in New Zealand has brought in its train a certain degree of quackery in connection with the sale of odd lines and special appliances. In addition to this undesirable feature there is also a fairly large volume of "cheap" and unreliable electrical ware finding its way into the local market. The second problem, however, is the more serious, for a large volume of unreliable material is being dumped on the market, and will ultimately place consumers in serious difficulties, and possibly still more serious accidents. The Government has proposed to set up a Board for the examination and testing of all electrical apparatus landed in New Zealand, but unless such a Board is properly constituted and controls actual importations of electrical goods it is difficult to see how it can be effective. Unless it is effective it will more likely become a screen behind which the practice might continue to be carried on with even worse results than at present.

The Electrical Federation, consisting of the electrical traders of the Dominion and others interested in the maintenance of a high standard of electrical goods, has taken the matter up and has made advances to the Government and the Power Boards with a view to securing combined action, and it is stated that some comprehensive scheme will be inaugurated as soon as the present deliberations are completed.

Some concern is felt in certain quarters that so much of the electrical material coming into the country is from other than British sources. Unfortunately this is the case, and it is admitted that this state of affairs will continue so long as the present tariff rules. New Zealand representatives of British electrical firms are notoriously unsuccessful in electrical tendering, and it is calculated that at least ninety per cent. of these tenders are secured by representatives of American firms. Even in Government circles, where it is usually a stipulation that material must be British, the disparity in prices is freely commented upon. It seems therefore that the question of the control of electrical material and the retention of New Zealand as a market for British electrical goods is bound up largely with the export policy of British firms. It would seem that some educational policy to acquaint the Dominion housewives and others with the quality and superiority of British goods is imperative, and that some strong measures are required by British manufacturers to secure sales of their commodities against the foreign article in this country.

Large Power Developments.

The recent announcement of the proposal to start operations on the Nitrate Power Works in the fjiords of the West Coast has resulted in many inquiries as to the exact magnitude of the work, and it is not generally realised that this scheme on Smith Sound will be the largest scheme in that part of the world. The proposal is to develop 300,000 h.p. by utilising the water of Lake Manapouri in a fall of 600 ft. to the sea through a tunnel 30 ft. wide.

The Government scheme for Lake Te Anau involves the utilisation of an available head of 700 ft., developing an available flow of 12,630 cusecs for a power of 1,600,000 h.p., while the Government scheme for Lake Manapouri contemplates utilising a 600-ft. fall and 8,400 cusecs to develop 840,000 h.p. Both these schemes are situated on the seaboard in the Sounds, where the southern coast most nearly approaches Australia.

Another large scheme in the South Island is at Lake Tekapo, where it empties itself into the Fairlie River. Here the Government contemplates installing plant to make use of a fall of 900 ft. and a flow of 5,100 cusecs to develop 400,000 h.p. at a point nearly forty miles from the growing city of Timaru on the Canterbury coast. The Lake Ohau scheme contemplates utilising a 300-ft. fall into the Waitaki River to develop some 125,000 h.p., while another scheme at Lake Hauroto has in view a fall of 514 ft., and a development of 100,000 h.p. on Te Waewae Bay within 50 miles of the capital city of the Southland Province, Invercargill.

Other South Island schemes of some magnitude include Clarence River, 100,000 h.p.; Wataroa River, 80,000 h.p.; Rotorua Lake, 60,000 h.p.; Lake Pukaki, 50,000 h.p.; Lake Hawea, 80,000 h.p.; Lake Hila, 55,000 h.p.; Lake Hall, 48,000 h.p.; Wilberforce River, 44,000 h.p.; and the Waitaki River, 37,000 h.p. There are twelve other schemes of more than 20,000 h.p., and ten others of more than 10,000 h.p. available when the larger schemes on the programme are unable to supply the demand.

The North Island is not so favourably placed with regard to major schemes, the general terrain being much lower and the run-off to the sea more widely distributed and shallower. The main Arapuni scheme to develop 163,000 h.p. is the largest North Island scheme, while a second scheme on the Waikato river is expected to produce 136,000 h.p. The two Lake Waikaremoana schemes will produce 97,000 h.p. and 32,000 h.p., while Rangitikei River at the Makohine Viaduct is calculated to make some 75,000 h.p. available; the Kaituna River, 65,000 h.p.; Aniwhaniwah Falls, 32,000 h.p.; Manganui River, 26,000 h.p.; and the present Mangahao scheme, 24,000 h.p. Other schemes of over 10,000 h.p. number seven, while there are eight of over 5,000 h.p.

Radio Reparations.—According to the *Daily Mail*, the Japanese Treasury has agreed to accept £4,000,000 from Germany in the form of Telefunken radio apparatus to cover reparations which are due.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A Multi-Pole Single-Tank Circuit Breaker.

The Westinghouse Electric & Manufacturing Co., of East Pittsburgh, U.S.A., has recently developed a new type of oil-tight multi-pole oil circuit-breaker, fig. 1. One of the features of the device is the enclosing of the three poles in a single round tank with dome ends, an arrangement for which some material advantages are claimed, including increased interrupting ability, increased terminal clearances for connections, and a minimum of housing-space requirements. The domed frame also permits the use of the space about the contact

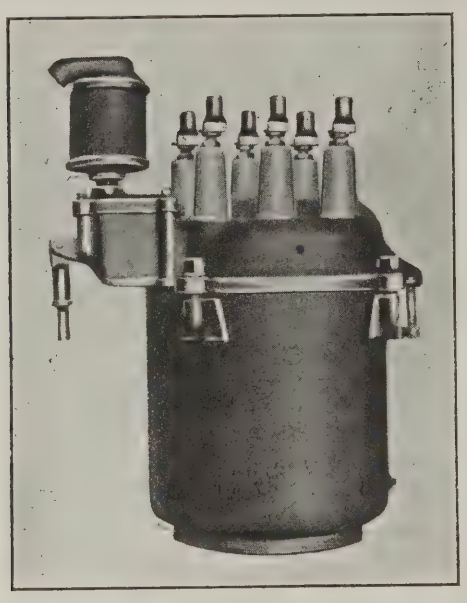

Fig. 1.—Single-Tank Circuit Breaker.

studs for additional air-expansion room above the oil, and also allows the system of operating levers to be enclosed within the breaker chamber, without increasing the overall height. A main shaft brought through the frame with a single operating lever outside, and well away from the live terminal connections and the remainder of the levers within the breaker, results in the removal of earthed moving parts from the vicinity of the bus-bar connections. The breaker is claimed to be particularly well adapted to meet the heavier requirements of modern power house and sub-station operations.

A Low-pressure Dial Gauge.

Special attention has been given to the peculiar requirements of low-reading pressure instruments in a new gauge of the diaphragm type which has been recently introduced by Messrs. Negretti & Zambra, 38, Holborn Viaduct, London, E.C.1. The general arrangement of the movement of this instrument is shown in fig. 2, and reference to this will enable its action to be followed. Pressure is applied to sets of diaphragms C and D enclosed in chambers A and B. The diaphragm sets are built up from a number of non-corrosive, nickel-silver alloy, corrugated disks, and the working range of each diaphragm is such that the elastic limit of the metal is never reached. The full-pressure displacement of the

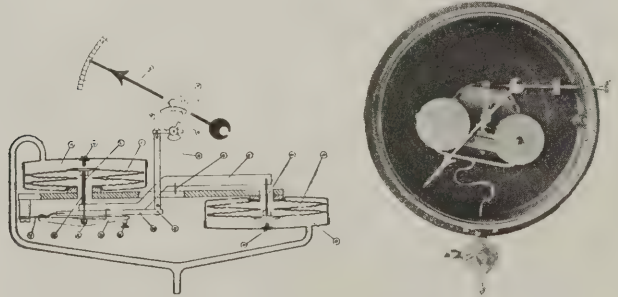

Fig. 2.—A Low-Pressure Dial Gauge.

diaphragm in one direction equals that in the opposite direction when under no pressure. Movement of the two sets of diaphragms is co-ordinated by the lever "F," which has a spring fulcrum G and is operated by the spring struts E and H without friction or backlash. A second spring strut L is attached to one set of diaphragms and operates the lever M through the lever O. Spring V acts as the fulcrum for both M and O, and also permits O to be lifted away from M. An additional spring X is fixed on O and keeps M in contact with the screw W. M magnifies the motion of the diaphragms and is connected at its extremity through the link N to a balanced crank P. F is heavier on that side of the fulcrum on which it is operated by the spring strut H and is of such a weight that it balances its other half with the addition of M and O and link N. The quadrant Q, operated through the balanced crank P, gears with a pinion which carries the pointer. Both the quadrant and pointer are carefully balanced and thus the whole mechanism is unaffected by alteration of position.

The stop T prevents the quadrant from coming out of mesh with the pinion at either end. Stops Y and Z operate on each set of diaphragms should a suction be applied, and a slot at the top of the link N permits the latter to continue its upward motion after the quadrant stop has come into operation.

The gauge is made in two sizes with 8-in. and 16-in. dials, and 20-in. and 40-in. scales.

A Novel Lock Nut.

A specially designed nut, which is claimed to be self-locking, is being placed on the market by Messrs. British Evertite Locknuts, Ltd., 57 and 59, Victoria Street, Westminster, S.W.1. The device is similar in construction to an ordinary nut except that it has a bevelled end and a deep annular V groove cut in the internal face. The nut is used with the bevelled end in contact with the resisting surface. When it is screwed "home" the metal reaction is claimed to cause the groove to yield, resulting in a slight distortion of the metal.

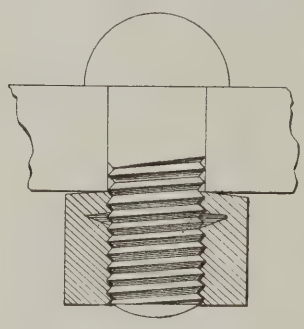

Fig. 3.—Lock Nut "Home."

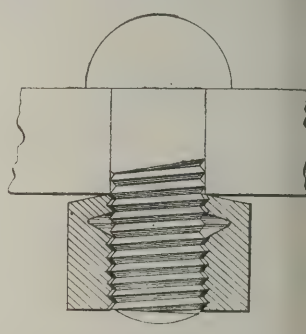

Fig. 4.—Lock Nut Loose.

Figs 3 and 4 illustrate the action of the device; when the nut is tight, the V partly closes and the threads grip on the top sides. It is also claimed that the device can be used repeatedly without injury to the thread of either the nut or the bolt. The nut is made in standard sizes from ⅜ in. to 2 in., and it is constructed of mild steel of 28-32 tons per sq. in. tensile strength.

A Two-Service Adapter.

Messrs. A. P. Lundberg & Sons, 477-489, Liverpool Road, London, N., have sent us a sample of their "Unitem" adapter, which is designed for use as either an ordinary adapter for a B.C. lamp socket, fig. 6, or a two-pin plug, fig. 5. The device is constructed in two portions, one fixed and one reversible. The former is an ordinary 2-pin plug and carries a free screwed socket. The reversible part represents an ordinary lamp-socket adapter on one side and a two-pin plug on the other. Suitable sockets are contained in both the

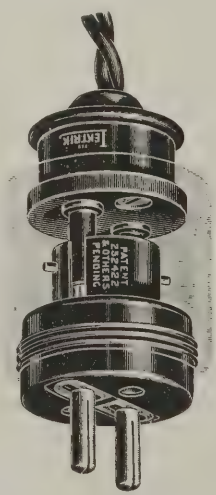

Fig. 5.—Plug Application.

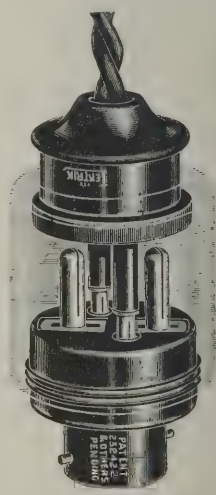

Fig. 6.—B.C. Adapter.

adapter contacts and the plug-pin contacts at the opposite side of the reversible part of the device. These in each case accommodate the plug pins of the fixed portion. The reversible portion is screwed into the free screwed socket in either direction. The two sets of contacts in the reversible portion are quite independent of each other and the plug half of the device is designed for cord-grip fixing. The plug pins of the adapter end are replaceable and two B.E.S.A. standard and three non-standard gauges of two-contact plugs can be accommodated. The body of the device is constructed of a black fireproof compound.

Electricity in Coal Mines.—I.

A Survey of the Present Position in British Mines.

(Abstract of Paper read before the Institution of Electrical Engineers.)

The three papers which were presented at the April 8th meeting of the Institution provided members with a general review of the present position of electricity in mines, the application of machinery at the coal face, and the design of storage-battery locomotives for use therein, and indicated also the directions in which the employment of electric power will be further developed in British coal mines.

One of the papers is abstracted below; the others will be dealt with in a later issue.

A Short Survey.

By R. Nelson, M.I.E.E.—*Abstract.*

There is now more than 1½ million horse-power of electric motors in use in and about the mines of Great Britain, which figure indicates a greatly accelerated rate of growth during recent years, but the total is, in itself, a moderate one having regard to the field for the further use of electricity that still exists on the surface and below ground in mines.

From a safety standpoint the electrical manufacturers of Great Britain have amply proved their willingness and ability to meet the special requirements of coal mining, so that, given the correct choice of apparatus and due care and attention to its maintenance, a high degree of safety is now readily within reach. One good result has followed: The author's own experience is that British-made mining electrical apparatus is at the present moment substantially better than German-made apparatus. In fact, in this connection it may reasonably be claimed that we have established a lead over *all* other countries. The correct solution of safety problems in mining owes a great deal to the skill and perseverance of Prof. W. M. Thornton.

A supply of electricity from an outside source, whether from a public supply or from a neighbouring privately-owned generating plant, has not, everywhere, commended itself to colliery owners. This is one of the points about which there still remains a very common difference of opinion between electrical and mining engineers. In its Memorandum of Evidence before the present Royal Commission on the Coal Industry, it is given as the considered view of the Council of the Institution of Mining Engineers that "unless power companies can supply current at prices very largely below those now in operation, the major proportion of the collieries are correct in continuing to produce their own power, either from exhaust steam or by waste heat from other sources or by generating plant using low cost fuel." It will be observed that the statement is not made in respect of a few examples of large colliery establishments. If it were, something might be said for it. It is made in respect of the "major proportion of the collieries," and implies support of the policy of continuing to use private generating plant for colliery purposes, even where supplies of reasonable efficiency are available from outside sources.

A mining engineer justifying the existence of a private generating plant, such as it seen "at the major proportion of the collieries," has usually the argument of a plant-in-being to support his view, coupled with the utilisation of fuel a sale for which cannot always, or readily, be found. In some cases waste heat from one source or another may be available. On the other hand, to set against these substantial arguments he has very rarely a complete appreciation of the fact that his power plant, as such, regarded from the point of view of efficiency, is a very indifferent performer indeed. Further, it often transpires that the prevailing idea of the cost per unit of current has its justification more firmly founded on tradition than on measurement.

An electrical engineer, subjecting such a plant to friendly scrutiny, concludes at once that he is contemplating an anachronism. He has been taught to believe that the important requirements of a source of power for any industry are reliability, flexibility, and efficiency. He further reflects that power-plant is inherently expensive, and he is amazed that it should be considered economically possible to continue to sink capital, bearing interest and depreciation charges of not less than 15 per cent. per annum, in power equipment when there exists the alternative of carrying the whole (or a large proportion) of the cost of power as a working expense, without involving the expenditure of any large capital sum. How flourishing must be the condition of an industry to which power is a prime necessity that can afford to pay so little attention to its efficient generation? But the electrical engineer may in his turn harbour some hallucinations: He sometimes fails to appreciate that a saving of even 50 per cent. in the cost of power may mean no more than an improvement of 5 or 6 per cent. in the pit-head cost of the coal won. He may also overlook the fact that it is the exception rather than the rule for colliery directorates to build up a reserve for the purpose of meeting the cost of modernising the colliery equipment from time to time, and that lack of funds is therefore sometimes the final and compelling reason for continuing obsolete plant in use for long years after it has served its time and generation.

The following is, in the author's view, the conclusion of this matter: In many cases the point at issue is regarded too narrowly, often determined mainly or solely by a comparison of actual or estimated generating costs with the cost at which power can be purchased, leaving more or less completely out of account the advantages, many of them considerable, which go with the purchase of electricity from an outside source; amongst them are: (1) The ease and quickness with which new machinery can be introduced without the necessity of additional capital outlay on generating plant; (2) the greater reliability, in general, of the supply, because it is the exception rather than the rule to see adequate spare plant provided at a colliery; (3) the convenience of having current "on tap," so that power and light are available at all hours of the day and night, at week-ends and on holidays, without the necessity of employing at these odd times more than the minimum of labour, and (4) the saving of time, money, and worry, arising from the fact that the hitherto constantly recurring power problem has been, once and for all, definitely and finally settled. It is, of course, very difficult to give each of these facilities a cash value, but each of them definitely assists production by enabling the management to reduce idle time, one of the important factors tending towards the present-day diminution of output per employé in British coal mines. The output per employé touches at once upon the most important result which usually follows from an unlimited supply of power, namely, the increased *use* of mechanical power. It is only by this means that the output per employé can be increased and the cost of coal lowered without affecting the daily wages of the workers.

There is one other point: The adoption of electricity for winding purposes without heavy first cost, already possible in two or three of the coal-fields, is gradually being made possible elsewhere by the largely increased size of the units of generating plant now being installed in the stations of public supply authorities. Partial electrification of a colliery, leaving out the winding engines and the larger steam engines, such as the fan engine, involving only partial shutting down of the colliery boiler plant, sometimes gives a somewhat disappointing result. Many schemes which have been only moderately successful as partial electrifications, have been greatly improved by a complete change-over. The winding engines are usually the last item to be converted, and they are, of course, the largest steam users and the most wasteful of all colliery steam engines.*

The author is of opinion that the future will show a growing tendency towards the purchase of power from an outside source. In the newly developed South Yorkshire and Nottinghamshire coalfields the larger collieries are gradually being interconnected by a system of transmission mains, so as to cheapen the cost of power by enabling most of the power plant to be shut down at week-ends and on holidays and by utilising more completely the available reserves of surplus power and spare plant. The collieries are beginning to appreciate that there is, after all, some merit in co-operative working. That is a short step, but a definite step, in the right direction.

The relative importance of the coal-mining and metal-mining industries, and the extent to which electricity is at present being utilised in mines, may be gauged by the information given below, which has been abstracted from the Mines Department records:—

Coal Mines.—The total amount of coal raised in Great Britain in 1924 was 267,061,027 tons, and the number of persons employed 1,213,724. The total number of coal mines at work in 1924 was 2,855, of which 1,629 were wholly or partly electrically equipped. It follows that 1,226 mines, probably most of them small, were still at the end of 1924 without

* In the December (1925) number of *World Power* there is an interesting statement by Mr. J. F. Perry on the subject of the efficiency of power production at collieries. He says: "It is very clear that even if the efficiency of the power plant is substantially increased it will have little, if any, effect on the present crisis, which only a difference of several shillings per ton can affect." Mr. Perry is, of course, quite correct, and what he adds later must be read with the general conclusion just mentioned in mind. He goes on to estimate that if the whole of the collieries were electrified the annual consumption of energy would be 4,430 million units, and the annual coal consumption for colliery purposes 3,950,000 tons. The actual coal consumption in 1924 was approximately 16,000,000 tons. A possible saving of 75 per cent. of the coal used for colliery purposes is indicated, and even though it is quite clear that Mr. Perry has in mind some approach to a counsel of perfection, the result of his calculation is still very striking.

any electrical equipment. The horse-power of motors installed in and about coal mines at the end of 1924 is given below :—

Surface	671,036 h.p.
Underground	810,896 h.p.
Total	1,481,932 h.p.

An analysis of the motive power employed above and below ground shows the following :—

	h.p.
Winding	107,139
Haulage	411,816
Pumping	348,803
Ventilation	102,911
Coal cleaning	112,660
Coal cutting	92,121
Miscellaneous uses	306,482
Total	1,481,932

Taken over the last 10 years the average rate of increase per annum of the horse-power of electric motors installed below-ground has been 6.83 per cent. The actual percentage increase of the total number of motors installed below-ground at the end of 1924 over the total number installed below-ground at the end of 1915 is 73 per cent.

Metalliferous Mines.—The amount of metalliferous ore raised in Great Britain in 1924 was: Iron ore 11,050,589 tons; lead ore 14,294 tons; tin ore 3,546 tons; manganese ore 2,457 tons; zinc ore 2,317 tons. The number of persons employed in metal mining was 19,481.

The total horse-power of motors installed in and about metalliferous mines at the end of 1924 was 23,524; of this total, 11,753 h.p. is installed on the surface and 11,761 h.p. underground. The chief uses are for pumping (9,391 h.p.) and ore-dressing (2,806 h.p.). The Mines Department records show that the horse-power of electric motors installed above and below ground in metal mines has increased by 17 per cent. in five years. Regarding the total amount of power of all kinds installed in and about the mines, there is no definite information available from which an up-to-date estimate can be made, but it is fair to assume that the power utilised in coal mines cannot now be much, if any, less than 3 million h.p. If that total is anywhere near to being correct, it follows from data already given that about one-half the engine capacity in the mines of Great Britain still remains non-electric.

The increase of electrical horse-power in each year is made up of (*a*) conversions from other forms of motive power and (*b*) additional motors. It is probable that the newly installed horse-power due to the former still greatly exceeds the newly installed horse-power due to the latter, and important conversions will continue to be made. The above is the main direction in which electrical engineers may look for further extension in the use of electricity in mines. Other important directions are (1) the greater use of in-bye machinery in place of hand-putting and pit ponies, (2) the extended use of coal-face machinery, and (3) the extended use of electric safety lamps. As to (1), the number of pit ponies is steadily, if slowly, decreasing, but in 1924 there were still more than 65,000 employed below-ground in British mines. With regard to (2), the growth in the use of coal-cutting and coal-conveying machinery in British mines from year to year is disappointingly small. With less than 20 per cent. of the coal output machine-cut, it may reasonably be asked whether an accelerated rate of increase in the number of coal-cutting machines employed, if practicable, would not be one unobjectionable method of increasing the output per employé, the gradual shrinkage of which in most of the coal-fields is one of the present difficulties of the coal-mining industry.

On the subject of (3), progress is best indicated by a short table compiled from the Mines Department records :—

Year.	Number of electric lamps in use.	Number of oil safety lamps in use.
1912 ...	10,727 ...	697,664
1916 ...	126,784 ...	610,821
1920 ...	245,900 ...	635,127
1924 ...	356,817	576,318

Miners' electric lamps as now used give not less than one candle-power at the end of nine hours' use. They are fitted with a 2-volt acid or a 2.5-volt alkaline battery, and weigh about 6 lb. More light can be obtained, but only at the expense of added bulk and weight, and it has always been a debatable point whether the advantage of additional light is worth the handicap of added weight. Larger and heavier lamps giving more light are, however, beginning to come into use for hewers and others able to hang up their lamps while they are at work. It is unlikely that the electric hand-lamp will displace the oil safety-lamp entirely, but it seems clear that the number of electric lamps will soon exceed the number of oil lamps in use.

In conclusion, two further directions in which electrical enterprise and research may hope to be of added assistance are the prospect held out by Prof. W. M. Thornton's experiments of a great improvement in the matter of underground illumination from the ordinary power distribution system, and the fact that storage-battery locomotives for underground use may well prove to be a very important contribution towards the solution of the pit-pony problem. Electrical engineering is, in fact, building up the reputation of an ever-ready help to the mining industry.

Discussion in London.

Mr. J. A. B. Horsley (H.M. Electrical Inspector of Mines) said that Mr. Mavor's paper was a very modest record of 25 years' achievement in a field which Mr. Mavor had made peculiarly his own, namely, the development of coal-face machinery. He said "developing" rather than "perfecting," because the evolutionary process was still very active, and although reliability had been attained by the slow, but sure, method of trial and error, finality was not yet in sight. Lest it should be thought that this reference to further progress was intended to imply depreciation of the excellence and practical utility of present designs, he acknowledged his appreciation of the ingenuity and readiness shown by makers of this class of machinery in altering details where the experience of accidents had shown weakness, having in mind in particular recent or projected improvements in switchgear, in the plug connector, and in the flame-proof enclosure of electrical parts of the machine, and now there was in view promising development towards the application of remote control to coal-face machinery. Mr. Mavor had referred to the priceless advantage possessed by electrically-operated machinery, in that the power could be easily and accurately measured; portable graphic recorders were used in at least one colliery to check the working of electrical coal cutters, critical examination of the charts enabling the management to compare the handling of the machine by different men and to correct errors of operation. The designer of such machinery had to face extraordinary conditions: that nature and man seemed to conspire to destroy the machine could be illustrated by reciting the circumstances of a fatal accident described in his own annual report for 1924. A bar coal-cutting machine had become wedged between roof and floor in a 19-inch seam and in the attempt to free it by using the power of the motor, first the haulage drum was broken, next the haulage prop, and finally the haulage rope. The drum was designed with an adjustable slipping clutch and there were fuses in the circuit at the gate-end box, but those "safety valves" had been attended to and the victim was working under the direction of an under-official of the mine. The difficulty of maintaining flame-proof enclosures intact under such conditions was indeed great. In the Prussian code of mining regulations there was a requirement that for underground use the covers of electrical apparatus should be so fixed that they could only be removed by the use of a special tool, and he had made a similar suggestion to manufacturers in this country because he felt it was a principle well worth adoption in order to make it difficult for unauthorised persons to meddle with such enclosures. He was inclined to agree with Mr. Mavor that the real safeguard in the use of electrical equipment, *i.e.*, the avoidance of risk of explosion, lay rather in the maintenance of adequate ventilation than in design, however excellent it might be, of the electrical enclosure.

Referring to Mr. Millar's paper, he felt that there was undoubtedly a field for storage-battery locomotives in coal mines, but in view of the considerable use made of them in America and in Germany it was unfortunate that Mr. Millar had not been able to support his advocacy by actual operating costs. There were about a dozen collieries and half as many metalliferous mines in Great Britain wherein storage-battery locomotives had been introduced, and in one of the latter cases the battery was also used to furnish the energy for operating rotary drills. Although the service required of battery locomotives was in no way comparable with that required of coal-face machinery, the same problem of proper maintenance must be faced by the management for the battery was not amenable to design which could make it proof against continued misuse. Referring to the competition for a prize offered by Mr. Markham, a coal owner, the report of the Committee would shortly be published by the Stationary Office; some of the provisions of the specification had been criticised on the ground that it would have been more logical to have adapted a mine to suit the characteristics of the storage-battery locomotive, rather than to have called for a freak locomotive to meet the existing mining conditions, but the makers of coal-face machinery did not find that short cut to success, although he willingly agreed that to get the best results it was necessary to modify the mining lay-out to meet the new conditions which the use of such machinery had established. The field trials of the locomotives in the competition proved the superior efficiency of the single-motor drive, if skilfully designed, because the winning locomotive only required one-third of the capacity while running over a test route, which was designed to represent the average work of one shift, whilst the next most efficient vehicle required one-half the energy of the battery. Dynamometer records obtained with the assistance of Mr. George Watson's registering dynamometer showed the rather surprising figure of 57 lb. per ton for the rolling resistance of the road. The actual draw-bar pull recorded ranged from 740 to 775 lb. with a load of 5 tons on a gradient of 1 in 24. As regarded flame-proof enclosure, nothing better than total enclosure with plain machined flanges could be applied to electrical apparatus for which free ventilation was not essential. The use of gauze or of anything approximating the fragility of that medium should be avoided, and intricate devices, however ingenious, were quite unsuitable for colliery conditions as existing to-day. Ventilation might be necessary for the battery, and, if so, it should be obtained by some robust device and even then that device should be subject to daily examination approximating that which the miner's safety lamp underwent.

Regarding Mr. Nelson's paper, the proportion of mines with electrical equipment varied widely in different parts of the coal field: For example, in Scotland 72 per cent. of the mines had electrical equipment, as compared with less than 54 per cent.

for the rest of the country; in South Wales and Monmouth 58 per cent. was equipped; for Northumberland and Durham the figure was 59½ per cent.; and for Nottinghamshire 88 per cent. South and West Yorkshire, taken together, approximated to South Wales, having 57½ per cent. equipped; taking North Staffordshire with the Cannock Chase, the figure was 55½ per cent., falling to 53 per cent. for Lancashire and Cheshire, and to less than 17 per cent. for South Staffordshire and Worcestershire. The h.p. of electric motors installed both above and below ground per mine also varied considerably for different areas, the average for the whole country being 910 h.p. per mine. Reviewing the 25 districts into which the country was divided, mostly separate counties, there were four with about 300 h.p. per mine, nine with about 600 h.p. per mine, and 12 with from 900 to 1,600 h.p. per mine. The proportion of the total h.p. installed for coal cutting and other coal-face machinery for the whole country was 6.22 per cent.; for Scotland alone the proportion was 16.6 per cent., whilst in South Wales it was only two-thirds of 1 per cent. In the Newport and Cardiff division of South Wales 362,000 tons of coal was cut by electrical means and 2,070,000 tons by compressed air, out of a total of nearly 37,000,000 tons. In the Swansea division the position was reversed, 168,500 tons having been cut by the former and 19,500 by the latter out of a total of rather more than 15,000,000 tons. All those figures related to the year 1924. It could be seen therefore that, great as had been the growth of electrical equipment at collieries since 1912, there was still ample scope for development if and when the mining engineer succeeded in controlling the natural conditions —where they were in his opinion at present antagonistic to the introduction of electricity—so as to make it safe to do so. The advantage of electricity in mining lay not so much in the lesser consumption of low-grade fuel for the production of power, but in the greater output that could be obtained by its use and in the ease and flexibility, to use general terms, with which it could be applied.

Mr. ROGER T. SMITH remarked that the contention that conveyors were better than locomotives in thin seams had yet to be proved. They had yet to ascertain how many pit ponies one locomotive would replace. A chain drive had disadvantages in that it was not so easy to clear obstructions and the gearbox would fracture by coming in contact with the road in case of derailment. Mr. Miller was pessimistic with regard to his locomotive speeds. There was a very good reason why the single motor was better than two; the Markham prize winner was of 8 h.p. only and if that were divided the efficiency would fall materially.

Mr. R. ROBINSON (nominated by the Students' Section) referred to the efficiency of turbine-driven air compressors after they had been in use for some time, and was of the opinion that double-acting engines were the cause of much waste of power; there was no need for other than the single-acting type.

Mr. W. B. WOODHOUSE remembered much of the good work done by Mr. Mavor, especially in cultivating the habit of measurement; the fact that it was possible to measure accurately (even air) was beginning to be realised, and thus the miner was acquiring correct data. When the efficiency of air transmission was discussed, the efficiency of use was often neglected. Mr. Nelson had had much to do with the drawing up of the mining regulations; he (the speaker) had had occasion to make observations thereon, on behalf of Yorkshire mine-owners, but experience of those regulations proved them to have been carefully and wisely framed. Private power generation, as against its purchase from a public electricity undertaking, was often favoured because of the absence of measurement; the decision was the result of an opinion, not the facts (he had known of cases where no wattmeters were installed and the figures were estimated). Moreover, interest and depreciation discussions were as a foreign language to miners. However, it was true that in the past few electricity undertakings had been large enough to cope with winders, but that state of affairs had changed and winders could now be connected to the public mains without inconvenience. Therefore, as existing steam winders dropped out of use, more public electricity would be used.

Mr. E. T. WILLIAMS supported the contention that compressed air was inefficient; long pipe lines and many flexible connections could not be maintained without numerous leakages, small in themselves, but when operating for 24 hours per day the loss of power they occasioned was astonishing. It was difficult to make users of compressed air appreciate such facts. It was not easy to make electric cables, especially trailing cables, that would withstand mining conditions; somewhat similar trouble was experienced in the Navy and it might be of interest to note in that connection, that a tough-rubber covered cable having a canvas cord sheath had withstood naval conditions very well and might also have mining applications. In view of the economic importance of the coal industry to the country, the economic crisis through which the country was passing at the moment, and the electrical development which appeared to be imminent, he suggested that the I.E.E. Council should appoint a committee to ascertain how the use of electricity in mines could be furthered.

Mr. F. T. HALL remarked that when electricity could not be applied at the coal face, electrically-driven air compressors located in well-ventilated positions further back might be used to supply air-driven tools at the face and so help to improve the ventilation at the coal face itself.

Dr. W. M. THORNTON was of the opinion that there was a considerable load yet to be obtained by electrical undertakings. If no gas were liberated in mines, electricity would be the ideal method of applying power therein; its use was therefore a question of safety. He thought that where gas was dangerously present electricity should not be used, except at such voltages as would be harmless. The chief reason for employing electric motors for haulage purposes was humanitarian, *i.e.*, eliminating the pony, and with regard to lighting they were 100 years behind. There was a great need to educate the miner so that machinery would be used and maintained in such a condition as would avoid accidents; that point should be taken up, if not by the I.E.E., then by some other responsible body.

Mr. C. E. SAYER pointed out that mechanical means of getting coal gave bigger returns, and though the installation of machinery might reduce the number of men employed in individual mines, the total number of employés in the industry would be increased thereby.

Mr. C. JONES said he had heard it said that the life of a cutter armature was four months, but he knew of d.c. machines that had been in use for 15 years; he did not like the condemnation of d.c. motors. Mr. Mavor had made no reference to the arc-wall cutter; its disadvantage was the use of trailing cables and something better than that was needed. Auxiliary electric air compressors had been used, as suggested by a previous speaker, but there was room for an electric drill as the compressed-air pattern had given trouble. The introduction of locomotives would not only mean the replacement of the pit pony, but also (on account of the extra weight) the replacement of the tram rails; indeed, the whole haulage system would need to be reorganised.

Mr. S. MAVOR, in reply, said that the use of in-bye electrically-driven air compressors for operating drills was not new, but they could not be employed on a large enough scale for coal cutting; moreover, in that case the consumption of electricity would be 20 times larger, and the capital cost would also be greater, than if the cutters were electrically driven. In mines in this country the track conditions were not favourable for the use of locomotives, and conveyors were more useful, but locomotives could be used on level roads that were crooked in contour. There were too many men in the industry who were not miners at all and should never have been there; they could, and should, be eliminated gradually. For every coal getter there were three attendants who were not miners and to whom employment outside was as open as to men of other trades.

Mr. L. MILLER was understood to have said in his reply that he had not much faith in the adoption of electric battery locomotives in mines, except for marshalling purposes and on crooked roads. Worm gearing was expensive, but the chain drive was cheap, and if they were to sell any locomotives at all they would have to be as cheap as possible. The costs given in his paper included everything. The existing track would, of course, need attention if locomotives were introduced.

Mr. R. NELSON, also in reply, drew attention to the remarkable fact that 5 per cent. only of the coal mined in the richest field of the world (South Wales) was machine cut, a fact which would surprise their American friends. He noticed that no one had attempted to contradict the main thesis of his paper, namely, that it was cheaper for the colliery to purchase electricity than to generate it itself.

The Faraday Society.

The Influence of Alternating Current on the Electrolytic Corrosion of Iron.

A PAPER on this subject was read before the February meeting of the Faraday Society by Professor A. J. ALLMAND and Mr. R. H. D. BARKLIE. The corrosive effect of stray earth currents on underground steel structural work has long been recognised and the effect of alternating currents has also been investigated, but no systematic experiments have hitherto been made on the effect of combined d.c. and a.c., although such a case may well occur in practice. In order to simplify the problem and keep the conditions constant and reproducible, the solution used was caustic soda, although the corrosion effects with this electrolyte are quite small, and systematic studies were made under comparable conditions on the corrosion of iron anodes with direct current, alternating current, and the combination of the two. With direct current, unless some "activating" ion be present in solution, oxygen evolution, accompanied by a rise in anodic potential, was observed, the metal remaining completely passive if the current density were not too low, the potential soon becoming constant. When, however, a chloride salt, for example, was added to the solution, activity was conferred on the iron by the Cl' ions and at a certain critical current density there was a fall of anode potential accompanied by a gradual displacement of the oxygen film on the electrode by a layer of green hydroxide.

The experiments with alternating current alone were made with electrodes of electrolytic iron in the form of cylindrical rods introduced through closely-fitting horizontal side tubes sealed into a small cell, to allow of the collection and measurement of any gas produced. Fresh electrode surfaces were exposed in each experiment and it was found necessary to exclude light, as the illumination of an electrode caused it to assume a more positive potential, even to the extent of rendering passive an otherwise active surface. The current densities usually employed were 0.075 and 0.375 amp. per sq. cm. The electrolytes were 2.48 N and 1.03 N and 0.2 N caustic soda, free from carbonate, and the frequencies 6, 40-45, and 380-420. It

was not possible to measure the gas evolved or the quantity of iron dissolved under the conditions of the experiments, and the most striking observations recorded were the colour changes through which the iron rods passed. These either remained bright, or else became successively straw coloured, yellow, golden, bronze coloured, reddish-brown, and temper-coloured. Most marked was the effect of frequency. Thus, whatever the alkali concentration, 10 minutes electrolysis with a current density of 0.375 amps. per sq. cm. produced no visible change in the electrodes if the frequency were 400, but altered them to a yellow light bronze tint at a frequency of 45, and to a dark bronze or reddish brown colour if the frequency were only 6. There was thus a marked increase of corrosion at the lower frequency, such has been observed by other workers in the case of lead electrodes. The explanation is that the discharge of H' ions during the cathodic pulse activates the iron by decreasing the oxygen content in the surface layer, and consequently enables a fraction of the anodic current to pass between metal and electrolyte in accordance with the reaction.

$$Fe + 2\oplus \longrightarrow Fe^{\cdot\cdot}.$$

A certain amount of this dissolved metal will remain in solution (and is probably oxidised to the ferric state). The rest will be thrown down as $Fe(OH)_2$, to be rapidly oxidised to $Fe(OH)_3$ by the oxygen present. The lower the frequency and the longer therefore the cathodic pulse, the more thoroughly will this reduction of the oxygen present in the metal surface take place, and the greater will be the ensuing activity of the metal during the anodic pulse.

In the experiments on the effect of superimposing alternating on direct current, the anode was electrolytic iron and the cathode and the auxiliary electrode for introducing the alternating current to the anode, of soft iron. Air was excluded, and the electrolyte (NaOH of concentration varying between 1.12 N and 3.07 N) was stirred by a stream of pure nitrogen. The direct current circuit contained three accumulators, a regulating resistance and a d.c. ammeter—the alternating current circuit was, as before, tapped off from an inductive resistance put across the a.c. generator, and contained d.c. and hot-wire ammeters.

The effect of superimposition was to produce corrosion in cases where none had occurred with either component separately. It was further shown that a high a.c. : d.c. ratio was favourable to corrosion and that a low frequency also favoured corrosion. The effects are best studied by reference to the anode potential-current density curves given in the paper.

Some experiments were also made using as electrolyte a CO_2-saturated soil liquid such as might represent that which operates on buried conductors and the results were similar to those obtained with caustic soda. The results of two of these experiments are reproduced here :—

D.c.	0.0125 amp./cm.^{2}
A.c.	0.0375 amp./cm.^{2}

	Weight of iron found in solutions in grams.	
	Frequency : 400.	Frequency : 40.
With d.c. only	0.00032	0.00032
With a.c. only	.00015	.00020
With d.c. + a.c.	.00060	.00075
Increase due to superposition ...	.00013	.00023

It is thus established that in electrolytes both more alkaline and more acid than those likely to be met with in actual cases of stray current corrosion, iron behaves in the normal way towards superimposed alternating and direct currents, and the authors see no reason why this should not also be the case for the more neutral electrolytes met with in practice where, even at very low current densities, the increased corrosion should become quite manifest, over long periods of time.

Electrical Progress in Spain.

In the course of an article on "Electrical Developments in Spain during 1925," in a recent issue of *La Energia Electrica*, Senor E. Callego says that progress was greatly hindered as a result of the national economic crisis.

The only new hydro-electric installation of any importance completed during the year was that which utilises the falls of Villalba de la Sierra, work on which was commenced in 1920 by the Sociedad Hidro-Electrica de Castilla, that at the Tambre Falls of the Sociedad General Gallega de Electricidad, and the extension of the installation at the Somiedo Falls of the Sociedad Hidro-Electrica del Cantabrico. The Villalba plant, which is located about 12½ miles from Cuenca, has a capacity of 15,000 h.p., the current being transmitted at 60,000 V a distance of about 40 miles to the Bolarque station of the Sociedad Union Electrica Madrilena of Madrid. The Cantabrico Co. completed during the year a new 7-mile canal to increase by 1,000 litres per second the quantity of water available at the falls; a new pressure supply pipe of 1,200 litres per second was constructed at the power station, where two new sets of 3,500-h.p. turbines and generators were installed, bringing the capacity of the plant up to 14,000 h.p. The company is at present engaged on the erection of two 50,000-V transmission lines, one from the power station at El Puerto to Trubia and one from Oviedo to La Felguera, in the province of Langres.

The Tambre power station of the Gallega Co., which will have a maximum capacity of 16,000 h.p. during nine months of the year, dropping to 7,500 h.p. in the other three months, is expected to be put into operation by about August next. At present work is in hand on the erection of a 70,000-V transmission line between the power station at Santiago, Villagarcia, Pontevedra and Vigo, a distance of about 53 miles.

Although completed in 1924, it was not until early last year that the 2,000-h.p. plant established by the Sociedad Portland Valderrivas to utilise the Estremera Fall on the River Tajo commenced the supply of current; a similar remark applies to the 600-h.p. plant of the Sociedad Electra Canguesa at Cangas and the 300-h.p. plant of the Sociedad Hidro-Electra del Rio Blanco at Los Arcos (Soria province).

Although not officially inaugurated until January, 1925, work was completed during the year and trials were carried out on the Urola electric railway between Zumarraga and Zumaya, a distance of about 23 miles. The line is being worked by 1,500-volt d.c. In February, 1925, the new Sierra Nevada electric tramway, 19 miles in length, was completed. This line runs through very hilly country which necessitated the construction of 14 tunnels and 21 bridges. In the last two months of the year two new sections of the Madrid underground electric railway were completed, increasing the length of the system to a little over nine miles.

During the year the Compania Telefonica Nacional de Espana laid a new submarine cable between Algeciras and Ceata, a distance of 18 miles, as well as erecting over 600 miles of new lines and opening over 30 additional exchanges. In preparation for the adoption of automatic operation, work was also commenced on the substitution of underground for overhead telephone lines in Madrid and Barcelona. Finally, it may be mentioned that the Government Centro Electrico y de Comunicaciones completed the erection of a high-power wireless telegraphy station at Prado del Rey, Madrid, which is able to communicate with New York and Buenos Aires on wave-lengths between 8,000 and 14,000 metres.

In addition to the foregoing, various extensions and improvements have been effected at several of the old-established electricity supply undertakings. Thus, the Sociedad Riegos y Fuerza del Ebro, in conjunction with the Sociedad Energia Electrica de Cataluna, has erected a high-pressure transmission line to connect the Tremps and Pobla de Segur hydro-electric stations in Catalonia. The line is about 6½ miles in length and works at a pressure of 110,000 V; it consists of three aluminium cables of a section of 107 sq. mm. with a steel core. The current is stepped down at Pobla de Segur to 90 kV. The Riegos y Fuerza del Ebro Co. has also added to the Camarasa power station a new Voith 22,300-h.p. turbine and a 15,000-kVA generator built by the American General Electric Co.

The Cataluna Co. has increased its water storage capacity and is increasing its installations at Saburo, Mar and Colominas, which, when completed, will effect an annual saving of 45,000 tons of coal. The Sociedad Electrica del Viesgo is erecting a 95,000-V transmission line between its power station at Usdon and Camarmena. The Sociedad Hidro-Electrica Iberica is further extending its plant at its Cinca power station, while the Sociedad Hidro-Electrica Espanola is engaged in substituting a 130,000-V transmission line for the existing lines between the Dos Aguas and El Molinar stations and Madrid. This company is also installing a 18,600-h.p. turbine and generator at its Villora station at Cuenca, which will bring its capacity up to 47,400 h.p. and the total capacity of the company's plants to 114,000 h.p., which represents an approximate annual output of 300 million kWh.

The Compania Mengemor added a third 500-h.p. turbine and generator at its El Vado station and at the Escuderos station replaced an old 300-h.p. set with a new one of 500 h.p. A new 2,000-kVA, 70,000/25,000-V transformer was also installed at La Carolina sub-station. In July, the Sociedad Motrices del Valle de Lecrin inaugurated a 60-mile transmission line at 60,000 V between the Durcat power station (Granada province) and Santa Fé, Almeria.

It is hoped that electrical progress will be more rapid during 1926 than it was in 1925, especially as the Spanish Cabinet has approved the general lines of the new scheme of the Minister of Public Works for the better utilisation of the country's hydro-electric resources by lumping together the annual State subsidies for the next 25 years towards such undertakings.

Electric Smelting of Iron Ore.—It is reported from Oslo that last September the A.S. Norsk Staal concluded, with favourable results, its experiments at the Trondhjem installation in the direction of the electrical production of iron according to the "electric gas reduction process" devised by Mr. Edwin, there having been produced for a long time previously 1.5 tons per 24 hours of high-quality iron in the form of iron sponge. Since then the company has been working so as to be able to carry on the process on an industrial scale, and for this purpose an application was recently made to the Norwegian Government with a view to obtaining a supply of 6,000 h.p. from the State hydro-electric works at Glomfjord, but the authorities are said to have not shown an accommodating attitude towards the company in the matter. Under these circumstances, Messrs. Edwin and Major Johanssen, the inventors and principal in the company, respectively, have approached Swedish interests and have entered into an agreement under which the new smelting works will be established in that country for the reduction of Swedish ore.

Swiss Electricity Supply Notes.

(From our Correspondent in Switzerland.)

The Power Station at Lago Tremorgio.

This station is situated south-west of the village of Rodi (in the Tessin) and near the Lugasca river and the main road of Airolo-Faido. Built as it is on the rocky flanks of the mountains, it is necessarily very simple, and the back of the building has been treated as a barrage wall, provided with pillared vaults, to protect the building from avalanches, so frequent in that region, but which so far have, fortunately, never reached the station.

It utilises the water of the Lugasca, one of the tributaries of the Tessin, which has a drop of about 880 metres. The Lake of Tremorgio provides a storage area of about 11,000,000 square metres. The task of utilising this water was not easy, and a collector under the lake was necessary. The rocks, too, were terribly fissured and bad, and the Swiss engineers had a trying time with geological disappointments, percolation of water, stoppage of suspicious chinks with cement, and so on.

The greatest care had to be taken to place the pipe-line in a part of the mountain free from avalanches, and some idea of the difficulty may be gathered when one considers that the grade in places is as much as 230 per cent., and as a rule 68 per cent. The total length of the line is 1,157 metres, of which 1,040 metres is buried in stone and earth, with special shelters above this arrangement at points where avalanches may fall. The weight of the pipe-line, including the cement and stone protection, is 520 tons. It speaks well for the engineers that no serious accident took place during the very difficult placing of this pipe-line.

The power station, which can be enlarged later on if necessary, is equipped with a Pelton turbine of 15,000 h.p., 750 r.p.m., coupled to a 10,000-kVA, 8,400-V, 50-cycle, 3-phase alternator. The supply pressure for transmission is raised to 50,000 volts. The escape-room under the turbine is tiled with granite slabs as a protection against wear and tear caused by the excessive speed of the water.

The lower part of the power-house contains the alternator ventilation equipment. At about 13 metres below the opening of the turbines are gratings which reduce the force of the water, which is carried off in a canal from 1½ to 3½ metres wide; a water-gauge is placed where the canal joins the Lagasca.

The Supply at Chancy-Pougny.

The Chancy-Pougny generating station is situated at the mouth of the Couchefatte, a little stream that flows into the Rhône, about two kilometres from the bridge that joins Chancy on the Swiss bank of the Rhône to Pougny to the French side of the river. As the Rhône forms the frontier between France and the Swiss canton of Geneva, there were lengthy negotiations between the two countries before the present establishment was definitely decided on. It was finally settled that all the power should be in the keeping of the "Société l'Energie Electrique Rhône et Jura," with the result that energy is transmitted at 120,000 volts into districts a considerable distance away.

The erosion at the mouth of the Couchefatte facilitated building operations, which were commenced in 1920. The dam, perpendicular to the course of the Rhône, is principally on the French side of the river, and is 85 metres long; it has five openings, each 12 metres wide, and the fifth is a lock for navigation. The barrage is 92 metres long, and the building contains five vertical single-wheel turbines, 510 to 570 r.p.m. At the time of their construction these turbines (Atelier des Charmilles and Ateliers Escher, Wyss et Cie.) ranked amongst the largest in either Europe or America, the outer diameter of the motor-wheel being about 5½ metres. The power divided between these five groups, when the fall is 8.16 m., is 7,600 h.p. At low water, with a fall of 9 m. the output is 8,700 h.p., 92 cu. m. of water passing per second. The ordinary output of water during 90 to 150 days yearly is 450 cu. m. per sec., falling sometimes to 310 cu. m. per sec., and even to 96 in the height of summer. The station can furnish annually more than 150,000,000 kWh.

Above the turbine building is a filtering pond, of over 4,000 sq. m. surface, separated from the level of the river by a reinforced concrete screen, supported on stays. The openings between these stays (7 to 16 metres wide) are closed by a coarse grating, and the upper end of the screen is situated on the right of the first vent in the dam, so that all detritus can thus be carried off. The filtering pond is separated from the sluices at the entrance to the machine rooms by extremely fine gratings, and each turbine has two of these stop-vents, worked electrically by independent levers from a frame above the service gangway.

The electrical equipment is housed in a building on the French side of the river. The alternators (Schneider of Champagne-sur-Seine) generate at 11,000 V, 50 periods. The connecting cables to the transformers and switchgear pass under the upper bridge of the dam in a special channel; this was lowered to the level of the alternators by means of a tower on the right of the turbine rooms.

The Chancy-Pougny power-house is worth a visit from British engineers staying at Geneva, whence it can be reached by tramway or train in a very short space of time.

The Bodio Undertaking.

If the suggested tax on electrical energy imported into Italy materialises, one of the first power stations to be affected will be that of Bodio, a station that has had the most chequered existence during the 20 years that have passed since it came into being. In 1905 the Société Motor of Baden obtained permission to use the waters of the Tessin and Biaschina. A canal 9 km. long, containing 16 galleries, brought 15,000 litres a second to the Centrale Electrique, and the fall, 260 metres, gave a summer force of 45,000 h.p. The cost of the power-station amounted to eight million fr., and the installation was considered as very satisfactory.

In 1917 the plant was sold to the Officine Elettriche Ticinesi, for munition work; more land was acquired near the power-station, and a whole suburb of workmen's cottages came into being, to say nothing of electro-thermal establishments and chemical works, which did a great trade during 1917-1918, when the number of hands employed was over fifteen hundred.

Following the trade slump after the war a terrible explosion occurred which literally wiped out of existence the great chemical factories of the Société Nitrum and the Société des Carbures du Day.

At present there are two factories using the electrical energy of Bodio, one a chemical factory and the other manufacturing artificial precious stones.

Recently the Conseil Fédéral made a grant to the Bodio undertaking to enable it to export a large quantity of energy into Lombardy, and at the same time it was arranged that both Lugano and Locarno should benefit by Bodio's water power. As both of these towns are placed inconveniently in the winter as regards an electricity supply, this is a most satisfactory plan, and the city of the Security Pact will no longer be faced with the previous risks of supply failure, while the surplus energy sent over the frontier will be of great value to the towns in Lombardy, which are not as lucky as their Swiss neighbours, who have endless supplies of "white coal."

Swiss Federal Railways.

Once again the Swiss Federal Railways have had to take into account the fact that birds can do damage to electric railways. In the canton of Valais the hawks have discovered that the top of a high insulator forms a capital observatory for surveying the land below, and having perceived their prey dash down upon it from the insulator. The result is that their wings touch the live wires and cause a short circuit, at the same time electrocuting the unlucky hawk.

To try to avoid recurrences of these troubles, special poles were placed here and there along the line, and for a time the birds used the new observatories; but after a time they returned to their old perches. The C.F.F. has now adopted a method of protecting the insulators by means of specially fitted wires, and this seems to have had the desired effect.

The first step towards the electrification of the C.F.F. between Lausanne and Berne was taken recently, when the Lausanne-Palézieux section was connected to the supply. It was hoped that the scheme would be completed by March 1st, but the line itself offers certain technical difficulties. Some of the bridges will have to be entirely reconstructed, notably that over the Singine between Flamatt and Thoerishausen, as well as the one at Mionnaz between Palézieux and Oron. The viaduct of Macconnons, near Romont, has just been finished, while the engineers are busy on that of Grand-Fey, near Fribourg.

On the Lausanne-Palézieux section, instead of taking forty minutes, as formerly, the run is now accomplished in twenty or twenty-five at the outside, at an even speed that ignores the pull-up of 222 metres. Furthermore, for the present, Palézieux jumps into the limelight as a sort of quasi-terminus. For until the sections to Berne and Lyss are electrified, trains to and from these places must change engines at Palézieux (as they had to do in bygone days at Sion, for instance), and this means a halt of six minutes, the shortest time in which the change can be made.

No doubt the good people at Palézieux will regret the further electrification of the line, which will put an end to those precious six minutes giving time for thirsty souls to "prendre un verre" in their society!

National Association of Supervising Electricians.—The fourth annual competition for the W. E. Highfield Shield is announced by the above Association and, in addition to the shield, three prizes will be offered to full members, and associates will have a special prize to compete for. The full member winning the first prize will be the holder of the Shield for one year. The prizes are offered to the authors of six selected papers which will be read at the Association meeting on May 4th. April 27th is the closing date for the papers to be sent in.

Modern Electric Textile Practice.

Some Details of Two Recent Mill Installations.

The flexibility of electric driving in textile mills is now generally recognised, and the two recent installations which we cite below support the claims of electric drive for quick starting and housing in quite out of the way places without impairing

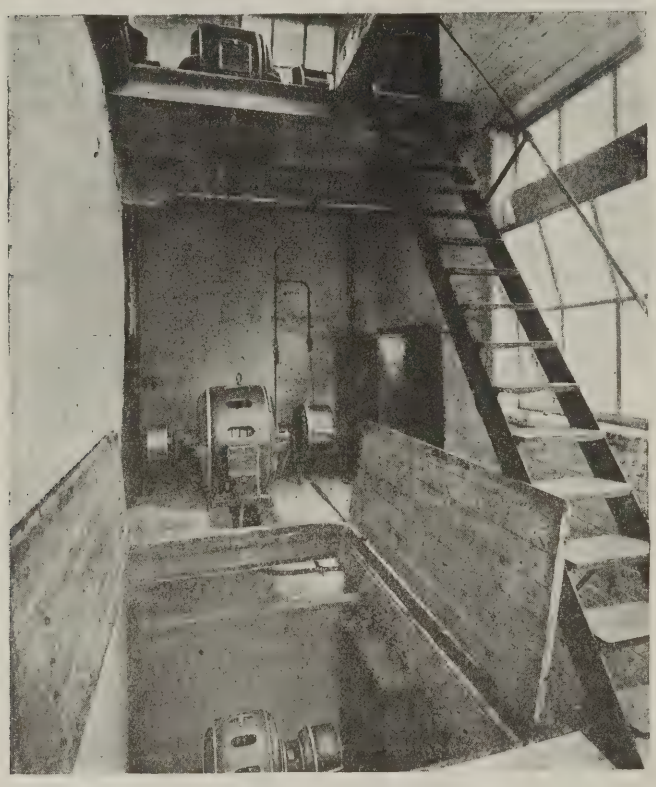

Fig. 1.—Three 200-h.p. Motors in Tower.

in any way the efficiency of the working. Electrical plant has recently been installed at the Osborne Mill, Oldham, one of the oldest cotton-spinning mills in the district, supplanting an old steam-driven plant, and it is recognised that the new installation is superior in efficiency and ease of erection to the steam plant. A new sub-station has been erected at the mill, and is supplied with three-phase energy at 6,600 volts, 50 cycles, which it transforms down to 400 volts. A main switchboard is installed in the sub-station, controlling the power supply from the transformer to the various motors in the mills, the motors being arranged for automatic starting up.

In order to render the motors in the spinning and carding rooms quite inaccessible to any except authorised persons, they are accommodated in a tower adjacent to the sections. The positions of the motors in the tower will readily be understood from the illustration, fig. 1, which shows three 200-h.p. slip-ring motors, each mounted on a separate floor and driving machinery in one of the spinning rooms. Each motor is provided with a contactor-type rotor starting panel, which contains contactors for both the stator and rotor circuits for switching on to the main, cutting out the rotor-circuit resistances when speeding up. In addition to the 200-h.p motor driving the machinery in the spinning room, there is also a similar machine for driving line-shafting in the carding room by means of a rope drive, leaving the ground space beneath available for any heavy machinery which may be installed at a later date. Two 75-h.p. slip-ring motors in the blowing and cardrooms are coupled to the main line-shafting through reduction gears. These motors are equipped with ventilation pipes, a provision necessary owing to the amount of cotton waste in the atmosphere.

Another interesting example of textile mill electrification may be seen at the Rydalmere Street Thread Works of the York Street Flax Spinning Co., Belfast. The installation consists of a Fraser & Chalmers 1,250-kVA, 500-V, 3-phase, 50-cycle, 3,000-r.pm. turbo-alternator, fig. 2, a 500-volts, iron-clad switchboard, and several textile motors driving the thread-drawing machinery. The turbine is designed for a steam pressure of 200 lb. per sq. inch, and exhausts into a jet condenser with a vacuum of 28½ in. The alternator, which is provided with a dry-air filter, has a maximum load of 750 kW under present operating conditions, the mill being only partially equipped. A particularly interesting feature of this installation is the method employed for starting the plant. When the mill is shut down none of the switches or starters is opened, the whole electrical installation being left directly connected to the turbo-alternator. The turbine is started with the exhaust open to the atmosphere, and the motors run up to speed with the turbine, full speed being reached in about 1¼ min. The set continues to run on atmosphere for another two minutes, by which time the condenser pump motors have run up to speed and a vacuum is created in the condenser, into which the exhaust is then directed by means of a change-over hand valve. This arrangement results in the whole mill running efficiently at full speed in 3½ minutes from starting. The drive is effected by 15-h.p. squirrel-cage motors, each coupled through a single-reduction gear and chains to the 100-ft. line shafts, each of the latter carrying 36 or 72 pulleys and belts, loose pulleys being employed for starting the thread-twisting machines. The motors, therefore, have to accelerate the whole of these lines of shafting, which means starting against approximately a ¾-load torque. The electrification of both of the above mentioned mills was entrusted to the textile department of the General Electric Co., Ltd.

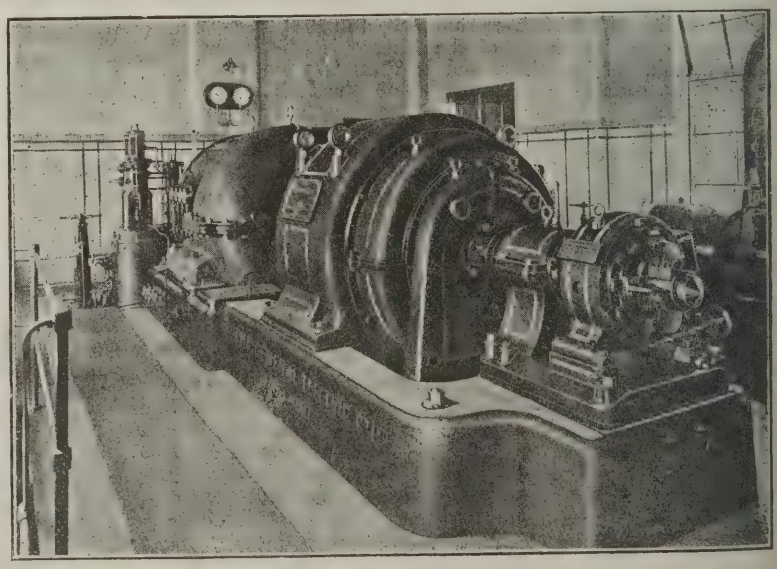

Fig. 2.—1,250-kVA Turbo-Alternator.

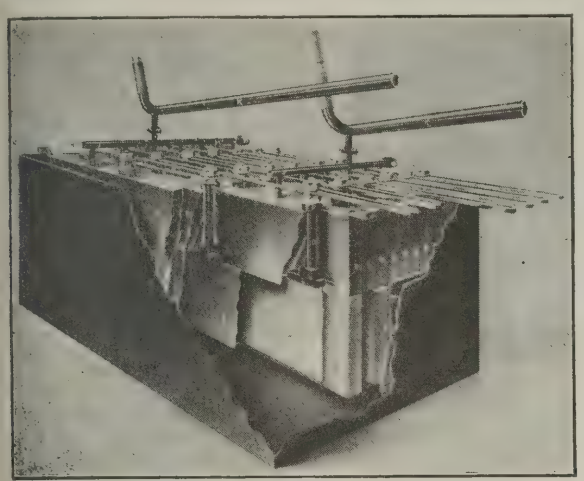
Electric Welding in Gas Plant.—In a paper on "Electric Welding in the Construction of Gasholders and Other Gasworks Plant," by Mr. J. N. Reeson, before the Institution of Civil Engineers, abstracted in the *Gas World*, the author discusses the influence of electric welding in the design of structures, and suggests that its employment without special consideration of design is likely to prejudice its application. Doubts have been expressed as to its strength in actual practice, the effect of corrosion on the weld and on the welding deposit, and its cost in comparison with riveting. As a result of tests carried out to determine the requirements of welded joints, the size of the electrode, number of runs, and lineal length of the electrode to be deposited per unit length of weld are specified on drawings. In order to ensure efficiency elaborate log sheets were evolved to check these important items, and as covered electrodes solely are used, it is essential that this valuable material should be carefully accounted for. The shop foreman and the foreman welder each have copies of the drawings, and the foreman welder's whole duty is to see that the most efficient joint is produced. The shop foreman is not relieved of responsibility because of the supervision of the foreman welder. The causes which led to the adoption of welding by the author's company date from 1916, when an extensive programme of gasholder construction became necessary in Melbourne. The serious collapse of a large gasholder in 1920 caused the author great anxiety. Investigation showed that the fracture was invariably at the lap of the sheets and not through the rivets. The author decided to substitute welding for riveting for joints of thin sheets which showed signs of serious corrosion. This was the first occasion, it is believed, for a large structure to be so treated, and it was necessary to alter the design and modify the methods of construction, as well as to equip the shops and site with the necessary welding plant and to train a staff of welders. The author suggests that the advantages of electric welding over riveting are, first, far greater security; and, second, simplification of design in the office and great economy in the workshop and field.



Electrolytic Hydrogen.

The Production of Gas for the Hydrogenation of Oils.

By A. EDGAR KNOWLES.

(*Abstract of a Paper read before the* Chemical Engineering Group *of the* Society of Chemical Industry.)

Many processes for the manufacture of hydrogen for the hydrogenation of oils have been suggested and tried out, but to-day there remains only one process which has stood the test of time, namely, the electrolytic decomposition of water. Probably the most important reason for this is that in the practical running of hydrogenation plant there must always occur disconcerting irregularities in the process due to the impossibility of obtaining absolute uniformity in the oil for

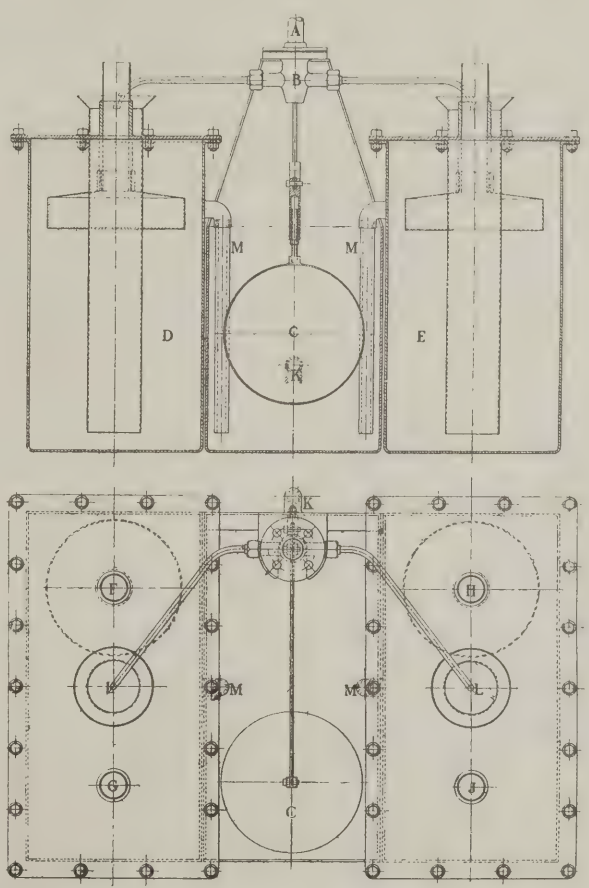
treatment, and if electrolytic hydrogen is used the quality is so high and uniform that it need never be considered when irregularity occurs in the hydrogenation process.

Given cheap, suitable fuel, the Haber-Bosch process, used by the Badische Anilin und Soda-Fabrik in the manufacture of synthetic ammonia, is the cheapest method of producing hydrogen on a large scale, but the hydrogen, on account of the large percentage of nitrogen it always contains, is quite unsuited for hydrogenating oils.

In considering the cost of electrolytic hydrogen one of the most important factors is that the by-product oxygen is usually a valuable asset. Generally, the quantity of oxygen is sufficiently large to be worth compressing and selling, and seldom is it so large that there is difficulty in disposing of the whole output.



Another factor is that the main item of cost—electricity—is the same for all capacities of plant, the production always being in the proportion of 1 cubic metre of dry hydrogen at 0 deg. C. and 760 mm. pressure for 2403.0126 Ah. A well-constructed modern type of cell has no measurable internal leakage of current and no gas leakage, and can be relied upon to give this figure. The ampere-hour capacity and therefore the output of gases at constant temperature is approximately 1 at 2 volts per cell, 2 at 2.25 V and 3 at 2.5 V. With cells running at 2 volts 4.806 kWh will be required per cubic metre of dry hydrogen at N.T.P.; at 2.25 volts 5.407 kWh, and at 2.5 volts 6.008 kWh. The capacity of a multipolar cell is in direct proportion to the number of electrodes less one (only the inside surfaces of the outside electrodes are effective). It follows, therefore, that the cost of cells at any particular voltage is practically in direct proportion to the output. The two main items of cost, electricity and interest and depreciation on outlay, will therefore be almost the same for small outputs as for large outputs for any particular voltage per cell and with the same charge for electricity.

In the latest types of plants the gases are washed by the fresh distilled water going to the cells and the feed is automatically controlled, requiring no labour. The total labour required is therefore very small and the caustic soda or potash used for the electrolyte is negligible; the practical consumption of distilled water averages about 10 per cent. above the theoretical. The final product is practically 100 per cent. hydrogen direct from the cells, and cannot contain any catalyst poison.

The first improvement to be introduced to electrolytic plant was in the purification of the gases. Siemens-Schuckert used a silver tube containing palladium pumice heated in an electrical furnace. This was fairly effective with low-quality products, but it consumed a considerable amount of energy and the tubes frequently burnt out and were expensive to replace. It was ineffective with high-quality gases.

In the next improvement the incoming gas was preheated by the outgoing gas and the palladium pumice was spread over a large area through which the gas was bound to pass. This apparatus proved completely satisfactory. Electricity for heating was only required when starting cold, after which it maintained sufficient temperature to completely remove the impurity.

In present practice woven asbestos diaphragms are used to separate the gases. This material is so effective that no subsequent purification is necessary. Curiously, it lowers the resistance of the cell, but, most important of all, it avoids completely a danger always present when metallic diaphragms are used—the possibility of the diaphragm becoming polarised and thus generating mixed gases on one side of this separator. This danger is a very serious one with batteries running at high pressures on cheap electricity. Fig. 1 shows the separation arrangements of the Knowles cell. Fig. 2 is a diagrammatic drawing of the automatic feed, showing how the gases are washed, with the distilled water going to the cells, removing the caustic spray from the gases and returning it to the cells, so that the loss of caustic is negligible when running. The first plant built (1910-11) at Bromboro' for supplying the oil-hardening plant of Lever Bros., consisted of 200 cells in series on a 440-V circuit and with 2,000 to 3,000 A passing through each cell. To-day 200 cells are running at Bussi in Italy at up to 7,200 A through each, and 600 cells are being built at Pierrefitte in the French Pyrenees to pass continuously 7,500 A

Fig. 2.—Automatic-Feed and Gas-Washing Arrangements.

each. These are for synthetic ammonia, as such large plants have never been called for in connection with the hardening of oils.

Fig. 3 is a view of the first of the improved type, erected at Erith three years ago—the first to be fitted with the automatic feed and gas-washing tanks.

The present demand for electrolytic hydrogen is so great, particularly for synthetic ammonia, that at several plants immense quantities of oxygen are being wasted. Ammonia works are generally in isolated places where cheap hydro-electric energy can be obtained, hence away from an industrial area where there is a demand for oxygen. The cost of compression and transport in cylinders is prohibitive. It might

be and probably will be conveyed by pipe lines under pressure, but the ideal is some large use for it at the source. Many minds are working on the problem at present, as with it is bound up the further extension of the use of pure electrolytic hydrogen in other synthetic processes such as the manufacture of alcohol, petrol, &c., which now appear to be getting near the practical stage.

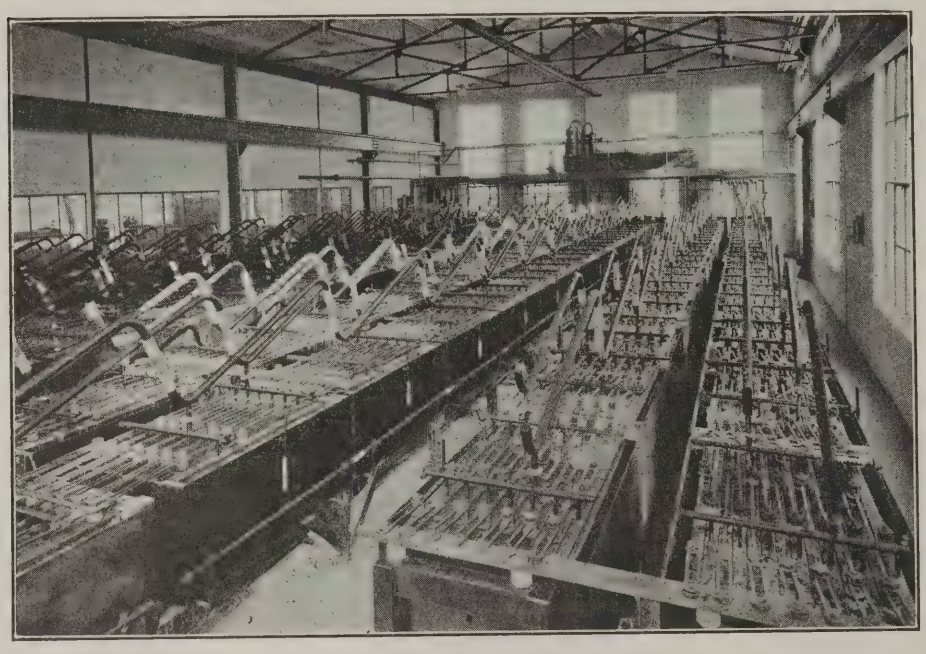

Fig. 3.—Electrolytic Hydrogen Installation at Erith.

Unlike most electro-chemical processes, the electrolysis of water does not require constant voltage or constant amperage, and these can be varied within wide limits. Further, the plant can be shut down or started up instantly by means of the switch.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

The Fine Regulation of Resistance.

I have read with much interest Mr. Amberton's letter describing his multi-step rheostat.

I think he exaggerates the necessity for a very large number of steps, except for such purposes as theatre-light dimming; 120 to 150 contacts is amply sufficient.

The very gradual stepping which he obtains with his 600 steps is obtained at a cost of considerable mechanical and electrical complications.

He has six rubbing contacts, three insulated brushes, a star-wheel, rack and pinion, and 85 electrical connections, whereas with a plain rheostat with 150 contacts there is one insulated brush, two rubbing contacts, and 151 electrical connections. These connections, of course, should not be "bunched," but should be kept clear of each other.

The ordinary screw-operated, straight-line regulator is the most simple and straightforward type, and makes it possible to keep all the connections quite clear of each other.

Rheostat.

London, *April 10th*, 1926.

Electricity Supply in Rural Districts.

An Interesting Installation at Titchwell, Norfolk.

In the small village of Titchwell, Norfolk, about seven miles from Hunstanton on the sea coast, an electrical installation has been put down for Mr. W. Ringer to supply the village with lighting and his farm with power. An old barn has been remodelled to serve for the engine and battery rooms, special ventilating outlets being provided to allow the acid fumes to escape through louvres in the ends of the building above the ceilings.

The generating plant consists of an 18-21-h.p. Petter cold-starting, single-cylinder, crude-oil engine directly-coupled to a 200-280-V, 9-kW shunt-wound generator made by the Lancashire Dynamo & Motor Co., Ltd. In addition to the usual charging and discharging switchboard, suitably equipped lighting and power panels are provided on a neat angle-iron frame; change-over switches are arranged so that the heating circuits of the Manor House (the owner's residence) may be run from the power board when required.

The battery room houses a Fuller, open-type, 360-Ah battery, the cells being arranged on the single-tier principle with the top of the bearers 2 in. from the ground. The usual copper connectors are carried by wooden brackets from the ceiling; this arrangement was necessary because the walls of the barn, being made of chalk, prevented insulators being fixed satisfactorily. Ample lighting and ventilation has been provided by additional windows, both in the engine and battery rooms. The building is situated close to a main road, and a storage tank has been erected so that the fuel may be purchased in bulk from tank lorries.

For aesthetic reasons the owner of the property would not allow overhead lines, therefore paper-insulated, lead-covered, steel tape-armoured cables, to the B.E.S.A. specifications, were laid direct in the ground, and in most cases just inside the fields adjoining the road, and where it was necessary to cross the road, the cables were drawn through cast-iron pipes laid at a depth of 2 ft.

For the Manor House and farm buildings special cables were run for heating and power, as it is intended to drive the following machines by electricity:—A grinding mill, a cake breaker, two shaft cutters, two root cutters, a small pump, and a separator. The majority of these machines are at present run by a paraffin oil engine through a long length of shafting, but this method of drive has proved costly, varying from £20 to £30 per month, and the change to electrical driving is estimated to provide a saving, considering the cost of generating is now approximately ½d. per kWh. A .03 sq. in. feeder has been run to a feeder pillar in the centre of the village, from which four .01 sq. in. distributors supply various buildings, including the village inn, church, post office, and 36 cottages. In most of these premises prepayment meters have been provided. The tenants generally are delighted with the change, and much appreciate the convenience of being able to "switch on" instead of lighting up oil lamps on dark mornings when most of them have to be up by 5 a.m. to work on the farm. It is particularly interesting to learn that the opinion of the consumers is that the electrical service is less costly than paraffin.

Messrs. Francis Polden & Co., London, were the contractors for the cable work and wiring, and Messrs. Powell & Co., Brancaster, carried out the alterations to the buildings. The work was generally supervised by Mr. E. A. Uttley, of Messrs. A. Hugh Seabrook & Partners, consulting engineers, who were responsible for the scheme.

Reviews.

An Introduction to Industrial Administration. By Mr. J. Lee, M.A., C.B.E. Pp. vii + 194. London: Sir Isaac Pitman & Sons, Ltd. Price, 5s. net.

One is sometimes surprised at the lack of appreciation of the changes that have taken place in industrial problems that is occasionally shown by men holding appointments appertaining to the administration of industrial concerns. It is often difficult, therefore, to convince these gentlemen, in argument, that it is necessary that certain steps must be taken in the light of present-day knowledge and experience to enable industry in this country to maintain the position it has held in the world's affairs. It is a national duty for all of us to keep ourselves advised of the requirements of our time and the probable requirements of at least, the immediate future; and to assist those interested in the fulfilment of this task we would recommend the above book. Its great value lies in the fact that it is in no way dogmatical. It draws attention to general principles that have been followed and it enlarges on the reasons of success or failure, leaving it in many cases for the reader to draw his own conclusion as to what would appear to be the correct procedure to follow. Knowing something of the mentality of energetic business men we have one small fear, that is, that some readers may become impatient with the book in places and therefore fail to read it through, for it needs rather close reading to arrive at certain cardinal points, and further, the arguments in connection with these points are often repeated in various chapters.

Under the heading of "Capital" the author gives some broad views on the part played by capital in industry and suggests that the State should make laws and further the protection of the small investor, and comments that shareholders are too often kept outside the confidence of the directors, knowing

little of the aims or intentions of the company of which they form a part. Mr. Lee also emphasises a point that the Communist is particularly apt to forget, that railways, for instance, which are the backbone of our industrial operations, were built when England was not a rich country, by men long since dead and forgotten, and that these men, therefore, are still contributing to the satisfaction of our daily wants. With regard to the chapter on the expansion of industry, in the light of present-day tendencies this is full of interest. It particularly deals with questions of the combining of interests with a view to efficiency. This, of course, has been the procedure in the newer industrial nation, the United States, for some years; in this country attempts have been made to follow the same procedure but very often the financial results have not always been as good as anticipated, not because the principle of "pooling" is wrong, but because of the difficulty of getting the maximum of efficiency on account of the strength of vested interests in old older firms, baulking the steps that should be taken to obtain best results. These difficulties are very clearly summarised on page 35. Under the heading of "Organisation of Industry" the author says "that the tradition of English industry is to overwork the management," and this is the outstanding difference between English and American methods." The author also deprecates the old type of management which was carried on largely through its autocratic, unsympathetic and often bullying methods, and points out that these cannot possibly produce the best results, particularly with a generation which now has the advantage of better education.

The real heart of the book is in the chapter on "Research, Costing and Planning." His reference to the fact that the Taylor system in full will not produce its best results in the long run in this country is certainly a timely warning and is well worth most careful reading and thought. The author's particular warning to those employed on the research side of our industrial organisations should be carefully noted. He says this body must "beware of the greatest of all dangers, *viz.*, the sense of self-importance, whereby suggestions from the actual industry are undervalued." On page 80, the author, referring to "Planning and Costing," says that the management which has a policy of constantly estimating and making actual costs, constantly bringing them to light, and is progressively determined to discover wastes and weak spots in organisation, will have time for thought and policy. It will not be the overworked management to which we have become so accustomed in England."

All who are associated with the problem of obtaining maximum results for a given wage will realise the truth of his statement that, "the reason for the prejudice against piecework is that the cutting of rates has seemed to be unjustified, and this is because there is insufficient interchange of opinion and enlightenment as between management and workers." This is a very sound statement because, as we all know, it is often necessary to change piecework prices, which may have been too low or too high. If too low, the initiative comes from the workmen and is completed by the management, and the workmen are satisfied. Under the heading of "Salesmanship," the author weighs the "pros and cons" of advertising. The advantages from advertising apply, of course, much more to some industries than others and, therefore, may not be so generally interesting as many of the other chapters. The chapter headed "The Purpose of Industry," seems to be a misnomer; nevertheless, it contains interesting matter and deals with such things as rules and regulations and psychological problems.

With regard to "the future of industry," the author opens with an interesting reference to the electrical industry, *viz.*, "Naturally enough, the greatest hopes in respect of the future of industry are centred at the moment in the distribution of electric power."

Kempe's Engineer's Year Book, 1926; 33rd Edition. Edited by H. R. Kempe and W. Hanneford Smith. Pp. 3,023 + 83; illustrated. London: Crosby Lockwood & Son. Price 30s. net.

Concerning this invaluable work of reference it is as impossible as it is unnecessary to attempt a detailed review. The list of contents, the names of its contributors and associate-editors, and the long-established reputation of the work, are sufficient recommendation. "Kempe's Year Book" is known throughout the world as a "compendium of the modern practice of civil, mechanical, electrical, marine, gas, aero, mine, and metallurgical engineering," and the contributors to its pages include acknowledged authorities in each of these branches of engineering. First issued by Mr. H. R. Kempe in 1894 with the expressed hope that it would take its place as the standard book of reference for engineers, the Year Book has continued to fulfil that aim in a manner and to a degree alike unique. For more years than we care to confess we have turned to the successive issues of this volume and have almost invariably derived valuable assistance from its pages.

Two features to which the Year Book doubtless owes a large measure of its perennial popularity are the careful revision to which each issue is subjected, and the fact that commercial information is included as well as matters of theory and general practice. The world's best sources of information are sifted with remarkable thoroughness—how this is done in the time available must remain a mystery—references to authorities and further sources of information are given throughout, and the whole work is arranged and indexed in a manner which enables the reader to find just what he wants in its 3½ million or so words. The inclusion of well illustrated and sufficiently detailed descriptions of particular makes of equipment of all kinds adds enormously to the value of the work; the maker's name is mentioned in every instance, and there is no difficulty in distinguishing between what may be termed "makers' data" and the matter compiled by the authors of the sections.

Naturally the specialist in any particular branch of engineering will not find in this work such detailed treatment of some problems as in the so-called "pocket" books devoted specifically to his own subject. For example, the electrical engineer will not find that this book can meet his needs to the same extent as Pender's Handbook or such another treatise, but Kempe gives a special section of over 100 pages to electrical engineering in addition to innumerable references to electrical equipment in other sections of the book. The special section on electrical engineering and that on electric traction have again been revised in detail by Prof. S. Parker Smith.

As an all-round work of reference for engineers of all classes, Kempe's Year Book continues to occupy more than creditably the place which it has made its own.

Alternating Current Circuits. By J. M. Bryant, M.S., and J. A. Correll, M.S. Pp. xii + 412; figs. 289. London: McGraw-Hill Publishing Company, Ltd. Price 20s. net.

According to the preface this volume is intended as an introductory course in the study of a.c. circuits and transmission lines, and the matter included has been used as a course for junior students in electrical engineering at the University of Texas, U.S.A., for the past eleven years, though now brought up to date for this publication. The work is divided into two major parts, the first one, consisting of Chapters I to VI, dealing with the theory and equations of a.c. circuits, and the second one, comprising the remaining chapters, dealing with applications of the foregoing theories to polyphase circuits and transmission lines.

Chapter I treats of the general relations of e.m.f. current and flux in a.c. circuits, embodying considerations of the generation of e.m.f., wave forms in simple electric circuits, power equations, and, very briefly, measuring instruments.

Chapter II deals with the characteristics of series circuits under the influence of sine-wave a.c. excitation, the different inherent characteristics of resistance, inductance and capacitance being defined and calculated. Resonance and the energy relations of compound series circuits are also considered.

In Chapter III the vectorial representation of sine waves and equations is studied, commencing with the generation of a sine wave by a vector and passing on to the vector illustration of different compound circuits. Addition, subtraction, multiplication and division of vectors are dealt with finally.

Chapter IV deals with parallel circuits on lines similar to those already indicated for series circuits.

The important subjects, power, power factor and apparent power are investigated in Chapter V.

Chapter VI makes a short though interesting study of complex a.c. circuits, and illustrations are given of such a circuit containing series and parallel arrangements of resistance and inductance; we feel that it is a pity that similar circuits containing capacitance also were not included.

Chapter VII, which opens the second part of the volume, deals with the current and e.m.f. equations of three-wire, single-phase and two-phase circuits, and of circuits with e.m.f.'s 120 deg. apart. Balanced and unbalanced loads are considered, as also are loads of different characteristics.

Chapter VIII deals with currents and pressures in polyphase circuits and embraces studies of two-phase systems supplying star- and mesh-connected loads and three-phase star- and mesh-connected circuits, under balanced and unbalanced loading conditions. The power consumed in the different kinds of circuits is indicated.

Chapter IX deals with the measurements of power in polyphase circuits, and similar circuits are studied to those covered by the previous chapter. The different well-known methods of power measurements are illustrated diagrammatically and vectorially, while the mathematical synthesis of each is given. Balanced and unbalanced loads are considered. The determination of the power factor of a three-wire, three-phase circuit supplying a balanced load from two wattmeter readings is given, and this treatment might advantageously have been extended to cover unbalanced loading conditions, as, of course, an accurate determination of the power factor cannot be obtained from two wattmeters under such circuit conditions.

Chapter X deals with the analysis of the amounts of conductor materials required for different systems of transmission and distribution, the circuits studied being single-phase two-wire, two-phase four-wire, two-phase three-wire, three-phase three-wire, and three-phase four-wire. The results of the investigation are summarised in clear tabular form. The constants of transmission lines are dealt with in Chapter XI, these covering d.c. resistance, a.c. resistance, skin effect, inductance and capacitance. Inductance and capacitance equations are given for single- and three-phase lines and for different arrangements of conductors. The chapter concludes with short notes on corona phenomena, the calculation of the disruptive critical voltage, the visual critical voltage, spark-over voltage, corona loss and calculations and exciting conductance.

Chapter XII gives the calculation, illustrated by vector diagrams, of short low-voltage transmission lines and distribution

circuits. These embrace single-phase and three-phase lines supplying non-inductive, inductive and capacitive loads. Useful circle diagrams, notably the Mershon, are included for determining receiving and sending end voltages at different load power factors. Vector diagrams are given to illustrate the effects of variations of one of the circuit characteristics upon the others.

Chapter XIII is a study of medium length transmission lines having appreciable capacitance and Chapter XIV discusses the solution of very long transmission lines by means of the differential equation.

The preceding chapters have all been based upon the assumption of sinusoidal wave forms, and the effects of non-sinusoidal shaped waves are dealt with in Chapter XV. Some of the causes of the production of non-sinusoidal waves are given, and even and odd harmonics are discussed. Equations are given for the R.M.S. values of complex waves and for the power consumed by a circuit having e.m.f. and current waves of any shape. Wave analysis by Fourier's series and the Fischer-Hinnen method are given. We commend to the author's attention the methods of wave form analysis evolved by Kemp and Clinker, for inclusion in a future edition of their book. Equations are given for the e.m.f.'s in the series circuit containing resistance, conductance and capacitance when a distorted current wave flows through the circuit, while complementary to this, equations are given for the current wave produced by a distorted e.m.f. wave impressed on the circuit containing resistance, inductance and capacitance in series. Finally, current and e.m.f. relations are investigated in parallel connected circuits when a distorted e.m.f. is impressed across them.

Examples, following some of the chapters, are worked through in detail and these are useful accessories. The volume is profusely illustrated by circuit and vector diagrams, which add considerably to its value. We think that every vector diagram should bear an arrow indicating the assumed direction of vector rotation, although in most cases the direction is immediately apparent. We can unhesitatingly recommend this book to those desirous of obtaining a thorough grounding in the essentials of a.c. circuit theories, but we think it would have enjoyed a wider circulation at a price not exceeding, say, twelve shillings and sixpence.

Trade-Mark Applications.

The following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from April 7th. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Krone (lettering and design). No. 461,946. Class 4. Electric and galvanic carbons.—The firm of C. Conradty, 9, Spittlertorgrabe, Nuremburg. (S. Sokal, 1, Great James Street, Bedford Row, W.C.1.)

Ceag (lettering and design). No. 453,216. Class 8. Electric accumulators, resistances, switchboards, cables, meters, and similar electrical goods for use in connection with miners' electric safety lamps.—Ceag (lettering only). No. 453,219. Class 8. Electric accumulators, resistances, switchboards, cables, meters, &c. No. 453,220. Class 15. Electric lamp bulbs, glass trays for charging standards, for use in connection with miners' electric safety lamps.—"Ceag" Miners' Supply Co., Ltd.

Unitron. No. 465,382. Class 8. Instruments and apparatus for use in radio-telephony and telegraphy.—A. J. Garrod, White Horse Place, Mark Street, Wellingborough.

Capitol (lettering and design). No. 466,307. Class 8. Light projecting appliances.—Capitol Machine Co., 100, East 42nd Street, New York. (Herbert Haddan & Co., 31-32, Bedford Street, Strand, W.C.2.)

Helenite. No. 467,422. Class 8. Electric cables.—St. Helens Cable and Rubber Co., Ltd.

ES (lettering and design). No. 465,388. Class 13. Switchboards and parts thereof, fuses and switch fuses.—The Edison Swan Electric Co., Ltd.

A.C.C., Ltd. (lettering and design). No. 466,827. Class 13. Ordinary electric lamps, and miners' electric safety lamps.—A. C. Cossor, Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

British Science Guild.—The annual meeting of the British Science Guild will be held in the Mansion House London, on Thursday, April 29th, at 4.30 p.m. The Rt. Hon. Lord Askwith, K.C.B., K.C., President of the Guild, will be in the chair, and the programme will include speeches on "The Future of the Coal Mining Industry," by Sir Richard Redmayne, K.C.B.; "Dyestuffs," by Dr. E. F. Armstrong, F.R.S. managing director, British Dyestuffs Corporation, Ltd.; and "Broadcasting and the Electrical Industry," by Capt. P. P. Eckersley, M.I.E.E., chief engineer, The British Broadcasting Company, Ltd. Cards of invitation to the meeting may be obtained from the Secretary, British Science Guild, 6, John Street, Adelphi, London, W.C.2.

The

Electrical Review

VOL. XCVIII. APRIL 23, 1926. No. 2,526.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Co-operative Research in the United States.

A RECENTLY issued Circular of the Bureau of Standards (No. 296), gives a full account of an interesting scheme of co-operative research which has been developed at the National Bureau. That institution, like our own National Physical Laboratory, has experienced the effect of the demand for trained research workers emanating from manufacturing industries, in the shape of a constant drain upon the personnel of the establishment. That the unquestionable advantages of research are thus gaining appreciation in the commercial world is very gratifying, and there can be no doubt that our industries are benefiting materially by the enlistment of research workers of proved ability and resourcefulness in their service, whilst the financial position of those workers is undoubtedly improved by the change of employer; but the loss of valued members of the staff, who cannot be speedily replaced, no less certainly constitutes a serious problem for the management of the laboratories.

The plan adopted by the Bureau of Standards is admirably conceived to benefit all parties, by providing a steady stream of trained research workers, familiar with the methods and resources of the Bureau, and capable of supplying the needs both of the Bureau and of industry. The fact that the scheme has recently "grown notably both in magnitude and variety of fields" indicates that it has proved its utility, and there appears to be no good reason why it should not be equally successful in this country, where the extension of research is so greatly needed.

Simultaneously with the foundation of the Bureau of Standards in 1901, the use of the scientific and technical research facilities of the Government by investigators and students was sanctioned by Congress, and there are to-day 61 research associates in the Bureau, maintained by 36 organisations. The plan is intended to permit qualified workers to utilise the Bureau's facilities and staff in conducting researches of mutual interest; to provide for training and experience in research in an institution specially concerned with that class of work, to promote close co-operation between the industries and the Bureau, to encourage the appli-

cation of science to industry, and to lend the prestige of the Government to the results of research. The "research associate" is appointed by the Director of the Bureau, but is employed by an industrial association or group, which desires the solution of some outstanding problem; he is usually a graduate, and to all intents and purposes becomes for the time a member of the staff. Each proposed research is approved by the Director, and monthly progress reports are made to the supporting association through him; the results are made available to the industry concerned by publication, but, apparently, may be treated as confidential, at the discretion of the Director. Inventions arising out of the research must be placed freely at the disposal of the public. Needless to say, the splendid resources of the Bureau—in respect of equipment, staff, and literature—together with those of the other Government institutions in Washington, immensely facilitate the specialised work of the researcher, whilst exceptional opportunities for private study are provided.

The circular to which we have referred gives examples of enormous savings effected by the work of the Bureau, such as 20 millions a year from motor-fuel researches; incidental economies are also realised, such as an estimated saving of £100,000 a year in insurance premiums by owners of lifts, the outcome of the Bureau's researches on interlocks. Examples of the work done by research associates are cited; for instance, the American Electric Railways Association instituted a research into the cause of breakage of welded rail joints, which were apt to fail in a year or two, whilst the rails lasted 15 or 20 years; it was found that butt-welded joints withstood many times as many impacts as seam-welded joints. "It is not unusual that a research pays dividends a hundred times its cost". . . if only our political and industrial leaders could be brought to a full appreciation of that fact! Amongst the many associations maintaining research associates at the Bureau is the American Society of Mechanical Engineers, which has two experts engaged in determining with precision the numerical constants and the properties of steam, as a basis for its more effective use.

From the particulars given in the Circular we are led to the conclusion that the system described is well worth the consideration of the Department of Scientific and Industrial Research, in conjunction with the Director of the National Physical Laboratory and the Research Associations assisted by the Department. It does not appear to compete with the work of the Universities, as the research associates employed are not novices, but graduates qualified to initiate and conduct research; the scheme, therefore, provides remunerative employment for university-trained men and a convenient avenue of access for them to the fields of applied science in industry.

It is interesting to note, in the Report of the Executive Committee of the National Physical Laboratory which has recently been issued, that the Laboratory does its best to place the knowledge which it has acquired at the disposal of industrial firms, whose representatives frequently visit the N.P.L. in search of information; but the numerous claims on the time of the staff render it difficult to provide adequately for this service. Many visitors from dominion, colonial, and foreign institutions are received at the Laboratory, and in some cases the technical officers of oversea Government departments are allowed to work for a period at the Laboratory in order to acquire familiarity with the methods employed in particular branches of work. Thus the Laboratory has already gone some distance along the path followed by the Bureau of Standards, and we trust that it will be found possible for it to go the whole way.

The Balfour Committee Still Sitting.

It were base ingratitude not to express sympathy with the members of the Balfour Committee on Industry and Trade in the enormous mass of information that it is falling to their lot to listen to and inwardly digest in the hope that they may ultimately guide the nation of the future to right conclusions. We are not surprised that members fall out by the way, though it says much for the public spirit of business men and women to find others ready to step into their places and carry on the good work.

Some of the subjects lately brought forward seem to suggest that the taking of evidence is nearing its end—or ought to be. Not that we desire to under-estimate the importance of these recent subjects, though they do seem to be of the "general" rather than the special class. For example, the Trade Exhibition Organisers' Association is reported as giving evidence regarding the inimical effects of the British Industries Fair upon the interests of its members. We are afraid that its efforts to excite sympathy for private exhibition organisers because of the increased patronage which our trades are giving to the Fair will meet with little success. So far as the electrical industry is concerned, it has shown plainly for many years that it can look after itself in respect of exhibitions. Indeed, we recall the early discussions out of which the present electrical exhibition policy developed; the industry then saw, as it sees now, that it was quite capable of running its own affairs and keeping the profits within the family circle. In co-operation with the Government it can run a thoroughly businesslike electrical section at the British Industries Fair. It is claimed that private organisers can bring to their exhibitions more overseas buyers than have so far been lured to the British Industries Fair. Here we should require to examine the evidence of both sides, but whatever has been in the past we hope that the 1927 Fair at Birmingham will be well patronised by overseas visitors because specialised action is to be taken in time to invite them.

Another point brought before the Balfour Committee is the position of the commercial traveller. The evidence did not relate to the electrical trade, but no doubt it interests this indispensable section of staffs connected with our trade. Exactly where the grievances of commercial travellers fit into the Balfour mosaic may not be immediately obvious, yet the fact that commercial travellers are making lower average earnings now than before the war, owing to the cost of living, is a tendency to be noted, though it may be partly due to bad trade and partly to the class of occupation becoming less attractive to the most suitable men. The evidence was advanced by the National Union of Commercial Travellers, and it included reference to the fact that employers in some trades were pledged not to take into their service any traveller who had left a competing firm. We have heard, on the other hand, of firms which have done their utmost to entice away other firms' travellers for the sake of their connections, afterwards dispensing with their services at the earliest convenient opportunity.

Yet a further point. Travellers sometimes in a moment of eagerness or of desperation, sign an unfair and harsh agreement in order to secure an appointment, and they regret it afterwards. We have often touched upon this point, but commercial traveller readers will know how, acting alone, they are likely to fall into such traps. Their Association asks the Balfour Committee to say that such agreements should by legislation be declared invalid.

All these are very interesting points, and they will find a place in the complete, many-volumed work of the Balfour investigators, but it requires all the optimism at our command, and more, to believe that we shall live to see much legislation as the direct outcome of its work.

Flaming June.

The change to "Summer-time" came upon us to the accompaniment of a hailstorm in London, but to compensate somewhat the post-bag brought us particulars of further events that are to be expected when June arrives. The programme of the Conference of the Electrical Contractors' Association and allied organisations which is to be held in June at Brighton completes, we hope, the list of engagements for that month. In the Electrical Review for April 2nd (p. 545) we published the advance

programmes for the I.E.E. Summer meeting, which takes place at Newcastle-on-Tyne from June 7th to 12th, and for the I.M.E.A. Convention at Glasgow which opens on the following Monday (June 14th) and continues until the following Saturday. Very considerately the organisers of the Electrical Contractors' Convention have allowed the technical Press representatives and any other electrical gentlemen who may desire, or be compelled, to be present at all three engagements, a long week-end respite, for Wednesday (June 23rd) will be occupied with preliminaries, the really serious work of the first annual E.C.A. Conference only beginning on Thursday and continuing throughout Friday. Altogether there will be between two and three weeks full of professional and business interest, interspersed with a round of social events which will make June a record month in 1926. But how much trouble might have been spared by all pulling together in the organisation of one big convention, and how much more effective would have been its electrical advertising effect upon the public mind in this year of Parliamentary and Press discussion of electricity supply!

The Optical Convention.

The Optical Convention is now over, and no doubt on the whole it has answered the hopes of its supporters. The display of apparatus was imposing, and the grafting on to the serious part of the programme of the series of "scientific marvels" and "optical illusions" was an ingenious step. Certainly, even allowing for the advantage of securing the Prime Minister to open the Convention, the publicity arrangements appear to have been well managed. It is rarely that a scientific exhibition gains so much attention in the daily Press. The electrical industry might with advantage study the methods employed—for electricity could surely present an equally imposing record of work accomplished and future possibilities. The series of papers read at the Convention was a comprehensive one and served to show the many-sided aspects of optics. We were glad to see included in the programme a paper by Mr. L. Gaster, emphasising the close relation between optics and illuminating engineering. Certainly a very large part of the work illustrated and described is of interest to all concerned with lighting problems. It is a misfortune that modern science is divided into such watertight compartments; many optical inventions for a specific purpose would find other applications if they were more widely known. The Convention, therefore, has done something towards bringing scientists together. Has it been equally successful in impressing the public with the value of optics? One wonders. We suspect that a large proportion of the non-technical public visited the entertainments but did not make much progress in the exhibition proper. We are inclined to suggest that on another occasion more attempt might be made to explain how the illusions were worked; by this means the public would be instructed besides being entertained.

Electric Cranes in Foundries.

In a foundry in the North of England an overhead carrying system was installed recently, and it is estimated that a saving of nearly 30 per cent. of the handling costs has been effected. In many foundries, especially of the jobbing kind, hand-operated cranes are still used, but in repetition foundries power cranes and runways have been chiefly used for a number of years. It is rather surprising that automatic electric runway systems, or telphers, have not come into more general use for conveying materials about foundries. There is certainly great scope for them in repetition foundries in delivering castings from the moulding shop to the dressing shop, and thence to the forwarding department—where there is a special forwarding department. The telpher, operated from the floor by a switch, is not a novelty, and it requires little skill to operate it. Perhaps it is because its excellent qualities have not been sufficiently made known that it has not come into more general use.

In America, electrical lifting and conveying plant is common in both ferrous and non-ferrous foundries and, in a certain technical journal, an instance was given recently of a foundry where a daily production of over 22,000 pounds of castings was maintained with only one moulding machine; two electric hoists, of three tons capacity each, handle all materials and do their work with an efficiency that makes this high production possible. In turning out this tonnage nearly 330 tons of moulding boxes, moulds, ladles, castings, &c., must be lifted, moved, and lowered. The simple electrical equipment takes the place of a complicated system of jib cranes, wheel-barrows, and other manual labour.

There are other advantages of electric cranes besides reducing operating costs, because, as already indicated, they have a big bearing on production. In a repetition foundry the work is kept moving in an unbroken flow, and the most efficient use is made of floor space. It is sometimes contended that hand-operated cranes are all that is required in small jobbing foundries, but, in the smallest non-ferrous foundry, modern equipment is well worth while, and in the large foundry which specialises in heavy machine-tool and engine castings a very considerable saving in labour charges can be effected.

Copper.

The market for this metal has been languishing for a considerable time now, and values touched a very low level. Indeed, the standard market declined to about the lowest point reached since the war. The remarkable feature is that this has all occurred in face of practically a record consumption. Of course, it has to be remembered that production is also at a record rate, and it is therefore necessary for consumption to keep at top notch if the situation is not to deteriorate statistically and values to be affected adversely. The principal cause of the unsatisfactory appearance of the market for some time past has, of course, been the poor economic and industrial position in Germany, where consumption fell off to a marked degree. This was a matter of considerable importance to the copper industry, as that country is normally such an important outlet for American copper. Meanwhile, consumption in the United States has been very well maintained, and although there are some doubts as to whether it is keeping up to its highest level, it certainly does not appear to have fallen away much just yet, but this in itself was insufficient to support the market in face of the diminution in Europe's takings. Latterly, however, the market has attracted more interest, and has assumed a rather better appearance. One of the reasons for this was the report that the stocks of refined copper in America had decreased during March to the extent of fully 11,000 tons, bringing the total stocks of refined metal there down to about 75,000 tons. This is no doubt all to the good, but there were other features in last month's statistics which were not quite so satisfactory, one being that refined output had increased and another that the deliveries showed such a large expansion compared with the previous month as to suggest that it was due to some accidental circumstance. However, even leaving these figures aside, the position does seem to have a slightly better aspect for the reason that there are certain indications which suggest that conditions in Germany have turned the corner, and although this has not yet translated itself into any very large buying of copper, a certain amount of business has already been done in connection with electrical schemes there, and it seems reasonable to believe that more is likely to follow. The importance of the electrical industry to the copper trade can be realised when it is mentioned that well over 60 per cent. of the American deliveries of refined copper are in the form of wire bars, the shape used for drawing into wire. In this country, of course, the outlook is somewhat obscured by the various clouds hanging over the labour position, but a factor which should not be lost sight of is that copper is at a very reasonable price.

The Manufacture of Radio Valves.

Some Impressions of a Visit to the Mullard Co.'s Thermionic Valve Factory.

One of the most noteworthy, and it may be also far-reaching, steps ever taken in the history of the British "wireless" industry was accomplished recently by the agreement for collaboration of the Mullard Radio Valve Co., Ltd., with Philips Glowlamp Works, Ltd., of Eindhoven, Holland.

Fig. 1.—A View of an Assembling Unit.

Prior to this arrangement, Messrs. Philips were the largest exporters of radio valves to this country, but since the conclusion of the above-mentioned agreement they have ceased to send their valves here. The cessation of this supply implies increased British production to meet the demand of the home market, thus creating more employment for British labour. Further, the arrangement means that all Mullard valves will henceforth be manufactured in Great Britain under the combined valuable patents of the two firms concerned, for it has conferred upon the Mullard Co. the right to the exclusive use of all Philips patents and improved processes relating to the specialised manufacture of thermionic valves. Messrs. Philips have corresponding similar rights under the Mullard patents with respect to the Continental markets, and a separate concern, known as the Mullard Wireless Service Co., Ltd., has lately been formed to take over the sale of the products manufactured by the Mullard Radio Valve Co., Ltd. Both the British Companies are under the able managing directorship of Mr. S. R. Mullard, M.B.E., M.I.E.E., who is also chairman of the Service Co.

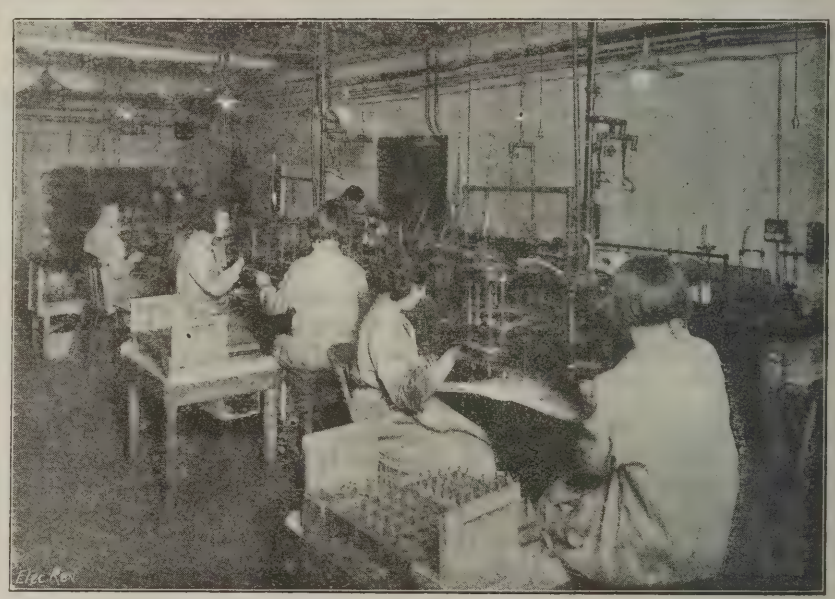

Fig. 2.—A Sealing-in Unit.

Fig. 3.—High-power Silica Valve Bay.

Established in a small way at Hammersmith, the Company's manufacturing organisation has grown steadily until to-day its factory in South-West London, at Balham, is claimed to be one of the largest in Europe devoted solely to the production of radio valves. Considerable improvements have recently been carried out, and present indications are that an extension of the premises cannot be long deferred. The organisation affords employment for some 400 people at present; the factory is equipped on modern lines and the plant and machinery is of up-to-date design, much of the latter being of the automatic or semi-automatic pattern; electricity is used extensively for lighting, power, heating, and testing purposes, and the switchgear and mains have recently been modernised to deal with a maximum load current of 2,500 amperes at 200 volts, while the overhead air ducts visible in the accompanying illustrations show that the efficient ventilation of the premises has received

attention. The factory is so organised that the various manufacturing operations which the component parts pass through follow one another consecutively in order to reduce transportation to the minimum. Commencing in the Components Departments, where the initial processes in the manufacture of connecting wires, supports, and electrodes are carried out, and the glass tubing necessary for making the "feet" is cut into the desired lengths, the parts pass to the Assembling Department (a section of which is illustrated in fig. 1), where the electrodes are mounted and prepared for sealing them into the glass bulbs, which operation is performed by machines such as those shown in fig. 2. The valves are then sent to the pump benches (fig. 4), where they are exhausted and sealed off, at which stage they are ready to undergo preliminary tests. It is understood that at every stage of their manufacture the valves are subjected to close inspection and metal parts gauged; such repeated precautions may be considered expensive, but it is economical to check a faulty article at an early stage in its production, and thus afford a chance of rectification rather than reject it on completion, which would involve wastage of material.

Fig. 4.—A Portion of the Pump Room.

Fig. 5.—Final Test and Inspection Department.

Following the "getter" process (when necessary), heat treatment, and ageing, the valves are "capped" (fitted with bases) and then finally tested (fig. 5); the glass bulbs are next acid-etched with distinctive marks and painted with coloured rings according to type, cleaned externally, and then packed ready for dispatch. In this connection it is to be regretted that the various manufacturers distinguish valves of similar rating differently, for it would be much more convenient and satisfactory to the user if all makes of similar characteristics were designated in a uniform manner. Electric welding machines are employed freely in making the

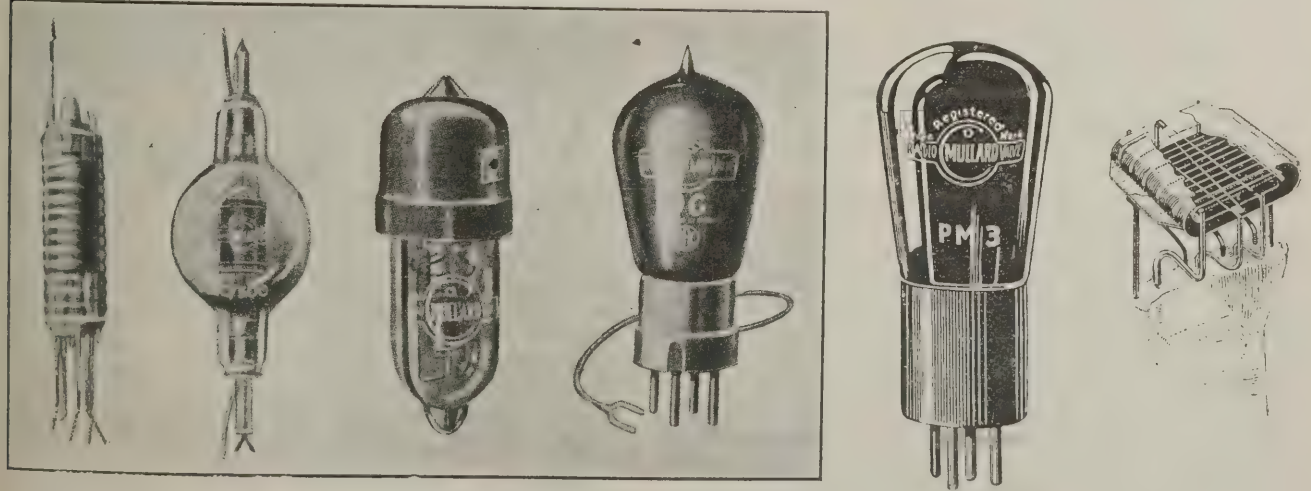

Fig. 6. Fig. 7. Fig 8. Fig 9. Fig 10. Fig. 11.

A Selection of the Types of Thermionic Valve made by the Mullard Company.

electrodes, which are carried on stiff nickel supports that are joined to fine platinum (or a substitute which enables a good airtight seal to be made) wires, which are embedded in the glass "pinch," and they in turn are connected to copper wires soldered to the 4 valve pins. Usually the grids and plates of the smaller valves are circular, those of power valves being oval or rectangular: grids of the former type are made by winding nickel wire over a metal former threaded to the correct pitch, suitable lengths being cut and placed in jigs with pieces of stiff nickel wire laid along them and to which each coil is welded at the points of contact; the latter type are wound direct on the supporting wire, which has been previously bent to the required shape and similarly welded. Thus each coil is securely attached to the supporting wire, and the precise diameter, spacing, and number of turns are fixed by the setting of the machines. Anodes are cut out of sheet nickel, rolled or stamped to the requisite shapes, and their edges welded together.

A somewhat intricate pattern of machine is used for sealing the supporting wires in the glass "feet" of the valves; the machines are similar to those used for making the corresponding portion of electric lamps, the operations being timed exactly so that the glasswork is rotated and heated by successive gas jets to the right degree at each stage. When the "pinch" has been made, the glass part is annealed and the foot is placed in a jig, which cuts and bends the supporting wires to the requisite lengths and shapes. Next, the filament (after undergoing a cleansing process) is inserted and welded to its supports, as are also the grid and anode, the machines used for assembling the electrodes being arranged to automatically locate and fix the elements in position. The filament of the 60-milliampere class of valve is so fine as to be only just visible to the naked eye; to enable it to be handled with facility the wire has attached to it small nickel clips which are so spaced as to give filaments of the correct length. The wire is laid in position and one clip welded to each filament support, the surplus being cut off.

Shaped bulbs purchased from the glass manufacturer are each fitted with a small glass tube, which acts as the exhaust pipe; in the case of the "pipless" pattern, exhaustion takes place through the "foot" of the valve. After internal cleansing it is placed over a "foot" carrying the electrodes, which is mounted in a machine and rotated through successive gas jets so that the glass base gradually softens, and finally the bulb and "foot" unite. On cooling, a tap removes the surplus glass, and after being annealed, the bulb is ready for the pumps. It is interesting to note that the liquid air needed for the pumps is produced on the premises.

Exhaustion is one of the most critical and costly operations of the whole manufacturing process. A "dull emitter" can only be satisfactory if it is considerably "harder" than a bright valve; that is, strict precautions are necessary to produce and maintain a good vacuum by exhaustion to a high degree, and during evacuation the valve is heated in order that occluded gases contained in the glass as well as the metal electrodes and their supports may be removed and thus minimise the harmful quantity that is liberated during the life of the valve.

The valve may be heated in two ways: either by electron bombardment (*i.e.*, raising the filament to a high temperature and at the same time applying a high voltage to the grid and plate), or the induction or eddy-current method (*i.e.*, placing a coil carrying high-frequency current over the valve); the former method involves filament wastage, and is therefore not applied to valves containing very fine filaments. During the heating a small piece of metallic magnesium (previously affixed to the anode during its formation) is volatilised, thus "getting" the last trace of gas and incidentally resulting in a silvery deposit inside the glass bulb. To enable a "dull" filament to emit electrons at its normal operating temperature, it has to be activated by heat treatment, which produces a chemical action between the thoria and tungsten of which it is composed. It is accordingly "flashed" at about 2,900 deg. K. for one minute, its temperature is then reduced to about 2,250 deg. K. for three or four minutes, and finally lowered to the normal working value of about 1,700 deg. K. The filament alone is heated (the grid and anode being inactive meanwhile), the voltage applied (approximately three times the normal) depending on the composition of the wire; the result is a diffusion of the thorium outwards, forming a coating on the surface of the filament, the free emission thereafter at low temperature being characteristic of thorium instead of tungsten. Either before or after the valves are completed by having their bases fitted, they are hung on "ageing" racks and run for a time under normal conditions before undergoing their final tests.

The Company's products are too numerous to mention individually: fig. 5 illustrates a part of the bay wherein high-power silica valves are made, and such a valve, capable of 10 kW continuous anode dissipation at 12,000 volts, is shown in fig. 6; its filament consumes 47 amps. at 28 volts. Fig. 7 indicates a glass transmitter of 300 watts at from 2,500 to 5,000 anode voltage, the filament needing 8 amps. at 18.5 volts; this type is assembled in such a way that the filament is easily renewable. Very similar in appearance are the rectifying valves, which are made to deliver d.c. up to 30,000 volts. The Philips-Mullard 30-kW valve is of the water-cooled metal-glass pattern. Two types of low-temperature thoriated-tungsten transmitters are made, the larger having an impedance of 4,500 ohms at 200 anode volts, and being suitable for an input of 20 watts.

Turning to receiving valves, fig. 8 shows an "ORA" type B, and a 4-electrode (or double-grid) valve is illustrated in fig. 9, which may be connected so as to neutralise the space charge and give good reception at anode voltages of from zero upwards; it may also be used to obtain dual amplification in the anode circuit by coupling the latter through a transformer back to the second grid. As an example of "dull emitters," the D.06 type is well known, but the latest pattern made by the Mullard Co. is the "PM" group, which is composed of the PM2, PM3, PM4, PM5, and PM6. They are all pipless (fig. 10), and the PM3 and PM4 possess an "N"-shaped filament (fig. 11), whilst the PM5 and PM6 have an "M" filament. The four valves take a filament current of only 0.1 amp. which can be supplied by dry cells. Other products are valve holders, fixed tubular condensers, the Holweck molecular pump, and carbonised cellulose resistances; it is claimed that the method of manufacturing wire-wound anode resistances enables the desired value to be attained with a 3 per cent. accuracy. In conclusion, it may be remarked that special classes of valves are produced for the Royal Air Force and the Admiralty.

The "Lux" Fire Extinguisher.—With further reference to Messrs. Walter Kidde & Co.'s "Lux" system of extinguishing fire by the use of carbon dioxide as recently described in our pages, a test was recently carried out at the works of Messrs. Brown, Boveri, of Milan, Italy, to determine what effect a discharge of carbon dioxide at the low temperature obtained with this system would have upon the insulating qualities of a standard 70,000-volt porcelain insulator. The report on the demonstration states that the insulator suffered in no way whatever; in fact, its insulating properties appear to have been materially improved when the insulator was enveloped in the CO_2 gas. Furthermore, it was shown that the stream of CO_2 "snow" produced by the "Lux" system is a non-conductor of electricity even when the distance between the live high-voltage lead and the nozzle of the gas cylinder was only 40 cm., which indicates that the system may be safely used to protect high-pressure apparatus. Another test conducted in America at the station of the United Electric Light & Power Co., New York City, seems to have been equally successful in demonstrating the efficiency of the "Lux" method of extinguishing fires in transformer vaults with the chamber doors either opened or closed.

Edinburgh Electrical Society.—A lecture was given on April 7th by Mr. G. Peers before the above Society on "The Electrical Equipment of a Battleship," when many interesting points, such as fighting efficiency, watertight installations, general lighting, and searchlights, were explained. Mr. J. G. Burchell, president of the Society, was in the chair.

Testing Porcelain Insulators under Artificial Rain.

By R. T. FLEMING, A.M.I.E.E.

(*Concluded from page* 615.)

A.I.E.E. Standards (No. 41, July, 1925) Insulator Test Specifications.

Clause 41-6.—Wet Flashover Voltage.—Wet flashover voltage is the voltage at which the air surrounding a clean, wet insulator or shell breaks down between electrodes with the formation of a sustained arc, the test being made as described under "Wet Flashover Test."

Clause 41-101.—(This clause is in particular reference to pin-type insulators, but the details referring to rain are common to all classes of insulators.)

Wet Flashover Test.—The testing arrangement shall be the same as in the dry flashover test, with the addition of equipment to provide a finely-divided and reasonably uniform spray at an angle of 45 deg. from the vertical and at a rate of 0.2 in. (5.07 mm.) per minute. The water shall have a resistance of from 6,000 to 8,000 ohms per inch cube (15,200 to 20,300 ohms per cm. cube), and shall be delivered to the spray nozzle at a pressure of not less than 35 and not more than 50 lb. per sq. inch (2.46 to 3.51 kg./sq. cm.) measured at the nozzle. The vertical and horizontal dimensions of the vertical area sprayed shall be measured in a plane through the vertical axis of the insulator, and shall be at least 1.75 times the corresponding overall projected dimensions of the insulator. The precipitation shall be determined by measurements taken, with the insulator removed, at the location of the top, centre, and bottom of the vertical axis of the insulator when in its test position.

The water shall be collected in a vessel having a top diameter of 6 inches. Individual measurements shall show a variation of not more than 25 per cent. from the mean of the three measurements.

V.D.E. Regulations. 12th Edition, 1925.

Instructions for the testing of suspension insulators valid from October 17th, 1922.* The spark-over voltage of strain and suspension chains shall be at least twice the supply voltage† when tested under rain falling vertically and at 45 deg. to the horizontal. The specific resistance of the rain should not exceed that of natural rainwater, about 50,000 ohms per cm. cube‡, and the rate of fall should be 3 mm. per min. The test must be carried out as far as possible under practical conditions as regards the position and the suspension of the insulators. The duration of the test shall be 5 min.

For apparatus to be used in the open air, the test voltage should be at least twice the nominal voltage, for 5 min. with the rain falling at the rate of 5 mm. per min. at an angle of 45 deg. C.

L'Union des Syndicats de l'Electricité, December, 1921.

A. Porcelain Insulators. Clause 12.—*Electrical Tests Under Rain.*—Artificial rain shall be produced having a precipitation of 5 mm. per minute. The water shall be taken from convenient mains and shall be at a temperature of 15 deg. C.; the jet shall be directed at 45 deg. to the axis of the insulator as set up in service. The voltage shall be gradually raised until sparkover takes place; this value should not be less than 90 per cent. of that stated by the manufacturer.

The preceding extracts of various testing specifications indicate the points wherein there is variation, and show the necessity of having at present a flexible equipment which is capable of adhering to any limits which may be laid down.

A *résumé* is given in the following table:—

Table II.

Comparison of Several National Specifications.

Nationality.	Authority.	Temp.	Precipitation.	Angle of precipitation.	Water resistivity.
British	B.E.S.A.	15°C.	1" in 5 mins. (0.2"/min.)	45°	Not greater than 20,000 ohms/cm.cube.
American	A.I.E.E.	—	0.2"/min.	45°	From 15,200 to 20,300 ohms/cm.cube.
French	L'Union des Sydicats d'Electricite.	15°C.	5mm./min. (0.2"/min.)	45°	Not stated.
German	V.D.E.	—	3 mm./min. ((0.12"/min.)	45° and 90°	Not greater than 50,000 ohms/cm.cube.

Some Special Tests Carried Out in the M-V Laboratory.

The Variation of Sparkover with Water Resistivity.

The effect of the resistance of the water used in sparkover tests is very marked; this point is mentioned in a recent paper* wherein the author states that one firm is "obliged to reserve the right to deviate from the above figures (presumably quoted in catalogue) at least 10 per cent. up or down," due entirely to the fact that in different tests the water resistivity varies.

In view of the number of contrary results reported for wet sparkover, some tests were carried out on standard 10-in. disk cap-and-pin type insulators to note this effect. The insulators were arranged in a string and the water was adjusted to a certain resistivity at a precipitation of 1 in. in 5 minutes at an angle of 45 deg.; the wet sparkover was then measured. After each flash the length of the string was reduced by one unit and the operation repeated. The results are shown in Table III, and graphically in fig. 12, p. 652.

Table III.

No. of Units.	Sparkover in kilovolts. Water resistivity in ohms/cm. cube.		
	21,200	6,800	1,750
1	47	44	40
2	84	85	73
3	123	115	95
4	164	148	106
5	210	180	145
6	242	212	175
7	282	246	212
8	320	285	242
9	357	310	283
10	396	350	320

Very similar curves to the ones shown have been obtained by the Compagnie Générale d'Electro-Céramique.† The unifying effect on the voltage distribution under rain is worthy of note and can be seen to advantage in the following table, giving string efficiencies based on Peek's empirical formula‡:—

$$\text{String efficiency} = \frac{\text{S.O. on } n \text{ insulators.}}{n \times \text{S.O. on 1 insulator.}}$$

* Adopted at the annual meeting, 1922, published in the *E.T.Z.*, 1922, p. 134.

† If the standard for suspension insulators is adhered to, the words "supply voltage" are to be replaced by "nominal voltage."

‡ A specific conductivity of 20 corresponds to this value.

* "Developments in Porcelain Line Insulators," by J. L. Langton, read before the International Conference of Large Electric Systems. Paris, 1925.

† Essais à très haute tension à sec et sous pluie sur Chaines d'Isolateurs, p. 17.

‡ Peek, "Electrical Characteristics of the Suspension Insulator. *Proceedings*, A.I.E.E. May, 1912.

Table IV.

No. of Units.	S.O. Dry.	Efficiency.	S.O. Wet. Water, 21,300.	Efficiency.
1	80	1·0	47	1·0
2	145	0·855	84	0·89
3	195	0·813	125	0·87
4	245	0·768	164	0·87
5	290	0·726	210	0·89
6	340	0·707	242	0·86
7	380	0·679	282	0·86
8	420	0·657	320	0·85
9	460	0·639	357	0·845
10	495	0·62	396	0·84

It will be noted that in the case of a dry string there is a steady decline of string efficiency to 62 per cent. at the eighth insulator, whereas in the case of the wet string the figure becomes 89 per cent. at the second insulator, and shows only a very slight decrease throughout the whole string; this feature is noted in the cases of wet tests whatever the resistivity of the water may be, the actual value of course altering. In general, the lower the water resistivity the lower the constant value for string efficiency. As a result of a number of tests at varying resistivities, it has been attempted to plot a series of curves (fig. 13) showing the variation of the sparkover voltage of strings of insulators consisting of one up to *ten* insulators. The particular use of these curves is to enable one at a glance to estimate the wet sparkover voltage for a given set of conditions. The curves cover tests at a rainfall of 0.2 sq. in. per min. inclined at an angle of 45 deg. It is impossible to maintain that the curves are perfectly accurate; they should only be regarded as an approximate check. The following Table V shows the percentage decrease in sparkover value as a function of the water resistivity. A resistivity of 20,000 ohms/cm. cube is taken as a 100 per cent. basis, it being the most usual figure aimed at in English practice.

Table V.

No. of units.	Water resistance in ohms/cm. cube. 20,000 %	16,000 %	12,000 %	8,000 %	6,000 %	4,000 %	2,000 %
2	100	93·5	98	92	88	85	79
4	100	99	97.5	92	86	82.5	67
6	100	97.5	95	90	86	80	74
8	100	98.5	95	91	88	84	78
10	100	97·5	96	90	87	85	82

The tests indicate the necessity of specifying the water resistance when carrying out S.O. tests under rain, and the advisability of having equipment with which these measurements can be made quickly and accurately.

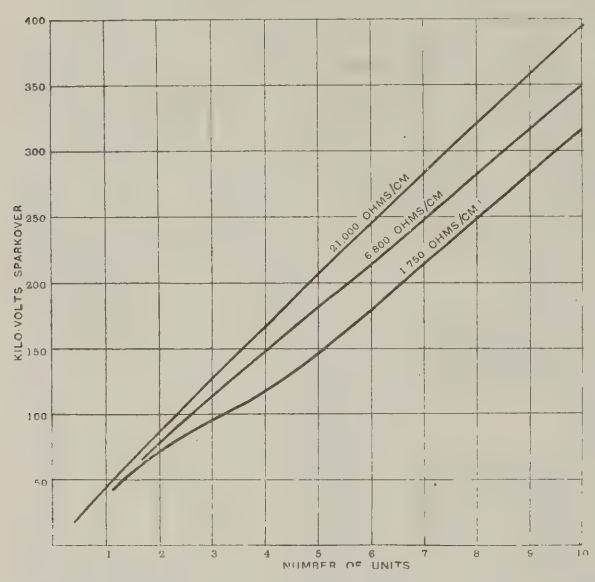

Fig. 12.

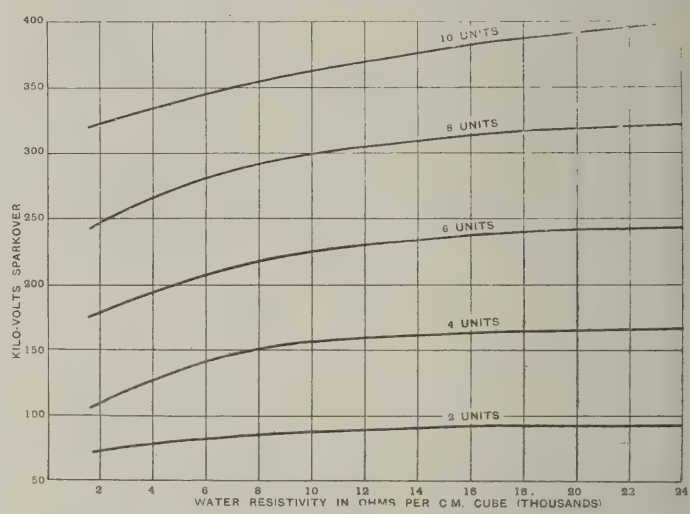

Fig. 13.

Figs. 12 and 13.—Variation of Sparkover with Water Resistivity and Number of Units.

Variation of Rate of Rainfall.

The tests on the insulators under varying water resistivity have shown the necessity of knowledge of factors when carrying out S.O. tests; to complete this a further number of values were obtained with alteration of the rate of precipitation, all other conditions being kept as standard as possible (*i.e.*, rain at 45 deg., resistivity 20,000 ohms per cm. cube).

Tests were carried out in a similar manner to those

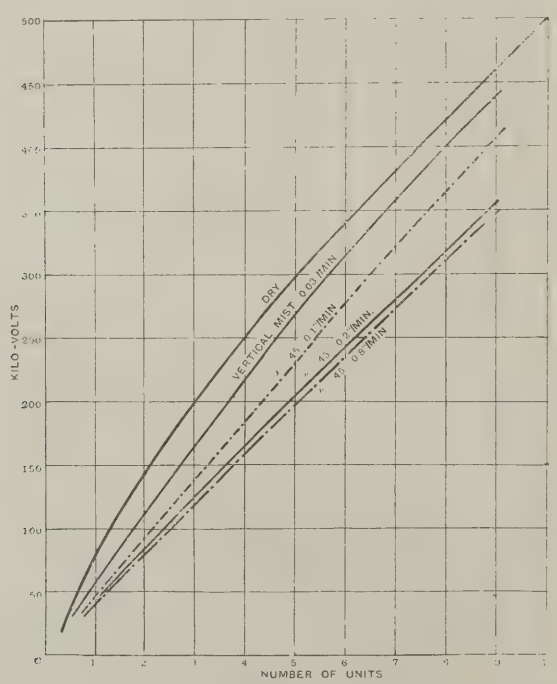

Fig. 14.

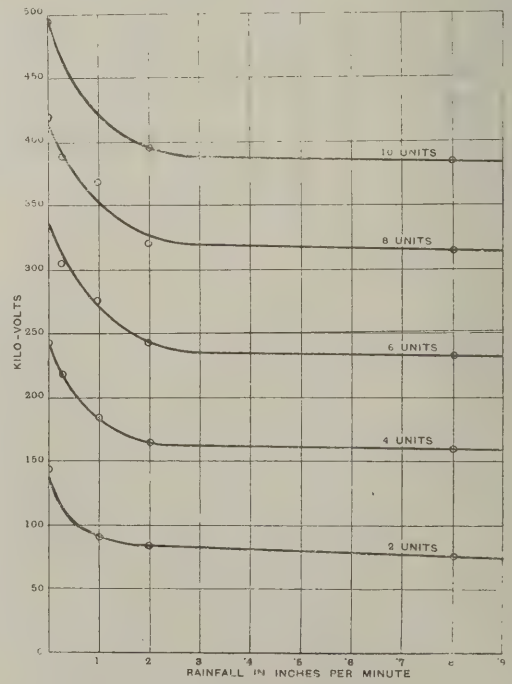

Fig. 15.

Figs. 14 and 15.—Variation of Sparkover with Rate of Rainfall.

previously reported; the results are given in Table VI and shown graphically in figs. 14 and 15.

Table VI.

No. of units.	Fine spray falling approx. vertically. 0.03"/min.	Rain falling at an angle of 45° to the vertical. Pressure 20 lb./sq.in.		
		0.1"/min.	0.2"/min.	0.9"/min.
1	·8	50	47	45
2	1·0	87	84	72
3	166	137	123	1·6
4	216	185	164	160
5	270	224	210	194
6	306	277	242	233
7	392	312	282	272
8	—	370	320	315
9	—	405	357	350
10	—	—	396	386

The results show quite a marked increase in S.O. values with precipitations lower than 0.2 in./min.; this is specially so in the case of a vertical mist where the values almost reach the magnitude of dry S.O. Any rainfall greater than 0.2 in./min. does not lower the values to any marked extent, as is shown in the comparatively small discrepancy between 0.2 in./min. and 0.8 in./min. The results indicate the necessity of obtaining at least 0.2 in./min. rainfall, which is the specified B.E.S.A. figure. The following Table VII shows the percentage decrease in sparkover value as a function of the rate of rain precipitation; the dry sparkover value is taken as 100 per cent.

Table VII.

No. of units.	Dry S.O.	Rate of rain precipitation at 45° in ins./min.			
		0.05"	0.1"	0.2"	0.8"
	%	%	%	%	%

8	,,	90	87	78	76
10	,,	93	85	80	77

The author wishes to thank the Metropolitan-Vickers Electrical Co., Ltd., for permission to publish the tests; Messrs. Bullers, Ltd., Evershed & Vignoles, Ltd., and Drake & Fletcher, for leave to publish photographs of their products; and Mr. J. B. Mitford, of the M.V.E. Laboratory, for valuable assistance in the experimental work and general preparation.

[Correction.—In the first part of this article (April 16th issue, page 614) under fig. 8, for "Dry, 355 kV" read "Dry, 422 kV," and for "Wet, 163 kV" read "Wet, 320 kV."

Under fig. 9, for "Dry, 370 kV" read "Dry, 355 kV," and for "Wet, 285 kV" read "Wet, 163 kV."

Under fig. 10 the values should also be reversed.]

The Future Price of Electricity.

An Estimate of the Limits Attainable.

By "INVICTUS."

Whilst we eagerly await details of the Government scheme for dealing with electricity supply in this country,* it is interesting to probe future possibilities as to price: to work from practical experience through the fluxing present to a future which, without being Utopian, is yet not inconceivable. What may we take to be the economic limit in the light of present experience, plus a little optimism?

According to the latest figures published by the Electricity Commissioners, the average cost of generation throughout the country for 1923 was 0.54d. per unit, and the average price paid by all consumers was 2.07d. per unit—roughly a ratio of 1 : 3, *viz.*, generation ½d., other costs 1½d. A view of practical merit is that this ratio should be "fifty-fifty." Before examining this, it is well to consider the question of reliability of supply. High efficiency in generation, though important, is not so supreme a consideration for this country as reliability. If reliability is now given the degree of importance it demands, a period will be put to experiments in the siting of so-called super-stations. Even interconnection has its limits narrowed down by the two factors of price and reliability.

The present cost of a capital steam station may be put at £18-£20 per kilowatt of plant capacity. As a substitute for some spare plant, £20 per kilowatt of cable capacity represents equality. This is reached with a 5,000-kW cable 40 miles long, but its full duty would entail a loss of 10 per cent. in transmission. Such a cable might save the cost of a certain amount of stand-by plant, but yet there must be a margin at both ends to enable assistance to be given in emergencies. Also, such a cable might usefully give and receive energy along its route, and it is this consideration chiefly which favours comparatively short cable interconnectors for use in this country.

It may be said that the cost of an equivalent overhead line would be only half that of a cable. But is it not probable that overhead construction for high voltages in this country is foredoomed to early scrapping? For low and medium pressures, for distribution purposes in rural areas, it is necessary, but for other purposes it is a timid expedient—a makeshift upon the pretext of economy. Reliability should not be sacrificed lightly, and it will not be economy to spend much money upon vulnerable, arterial, overhead lines in this country. They are liable to grave interference by lightning, birds, and atmospheric deposits over the insulators, which lead to failure. The insulators also invite potshies from the exuberant youth of the districts which such lines would traverse, whilst maliciously-fired rifle or even catapult shots would play havoc at any moment. Further, overhead lines require constant patrol, whilst their life cannot be expected to equal that of a modern cable laid underground.

The soundest course for development appears to be to install modern generating plant, including ample margins of spare, at or near the load centres, and to interconnect with cables when they will improve the degree of reliability or are obviously desirable from other practical points of view. There are many situations where advantage can be taken of the efficiency of large generating units, but much smaller plant can give very efficient results—and better reliability.

There is a national point of view about this matter which is not, perhaps, at once apparent. Generating plant produced in this country very largely utilises our own natural products, such as steel and iron. Our works are equipped for its manufacture, and our artisans and labourers have generations of inborn mechanical skill as their heritage for its making. By employing all this and producing plant for our own use, we shall be able to produce for export at prices which, together with the goodwill which goes with our international reputation for similar products, will further develop our oversea markets and so enrich our home conditions of life.

In the production of cables or overhead lines, most of the materials have to be imported by us, and the proportion of labour cost for manufacture is small, with no bulk of skill.

There is a better case for the development of our electricity supply industry by installing modern plant than by the wholesale scrapping of existing stations, merely because they are not large. Let them be made efficient with modern plant, where such plant would enable reasonably low generating costs to be obtained.

* This article was received on February 27th, 1926.—Eds.

Without question, there are many existing stations which should be shut down, and a bulk supply is the obvious need, especially where a more important station is not far away. Bulk supply should always imply a dual supply. When taken, it should be distributed as alternating current, or at least only partially converted whilst the change-over from direct current is effected. In most cases the change-over is but a puny giant if it is fully examined.

This digression upon the theme of reliability and method was necessary for the satisfactory study of future price.

We may expect to achieve average generating costs of 0.3d. per kWh with coal at present prices. If, as seems possible, the price of coal should advance, our average will exceed 0.3d.

With a present consumption of, say, 100 kWh per head of population per annum, the "other costs" amount to 1.5d. per unit. A consumption of 500 units per head suggests the figure of 0.3d. per unit for the "other costs," or the ratio of fifty-fifty previously mentioned. There is no fundamental verity about this particular ratio, but it does appear to bear a certain significance.

Five hundred units per head and a load factor of between 50 and 60 per cent. are not extravagant anticipations, but for a population of fifty millions it gives an output of 25,000 million units per annum, with a top load of five million kilowatts. Allowing reasonable margins for spare, with some interconnection, the total installed plant capacity will be, say, 6 million kilowatts. At £18 per kilowatt installed, the capital sum will amount to 108 million pounds sterling. Interest and depreciation upon this, taken at 10 per cent., amounts to nearly 11 million pounds per annum—about 0.1d. per unit for the output estimated.

For transmission and distribution a similar amount of capital expenditure will be called for, so that this also indicates the figure of 0.1d. per unit.

A further similar item will be required for repairs and maintenance in connection with transmission and distribution, together with management, rates, taxes, accounts, publicity, and reserve.

All charges may therefore be considered as follows:—

	Pence per unit sold.
(*a*) Generation	0.3
(*b*) Capital charges (generation) ...	0.1
(*c*) Capital charges (transmission and distribution)	0.1
(*d*) Recurring expenses	0.1
Total	0.6

Of the above items, (*a*) and (*b*) are common to every load, but (*c*) and (*d*) are subject to apportionment between producing and retailing organisations.

At two-part tariff rates the total revenue requirements are met by a charge of £6 per annum per kilowatt of installed generating plant, plus 0.3d. per unit; or (allowing a diversity of 1.5, including spare plant provision) £4 per kilowatt of the purchaser's maximum demand, plus 0.3d. per unit. The kilowatt charge is capable of further easing by an appropriate division of the items (*c*) and (*d*) as between producer and bulk purchaser.

In the light of these considerations it seems that present-day prices are not so very far removed from the visible limits, at least so far as the bulk of the present output is concerned. It is unfortunate that insufficiently-informed speakers should talk at large about supplies at 1d. per unit. This leads quite satisfied consumers, who are at present paying reasonable prices for lighting and certain other purposes, to expect the impossible. Even popular price cutting is liable to bring an unwelcome reaction in the course of a year or two. We should not forget the advent of the metal-filament lamp, the regrettable audacity of the "point fives," and the possible prices of copper and lead.

The foregoing computations refer, of course, to average figures for the whole country; they imply a range of prices to consumers between about 0.5d. per unit for steady industrial loads of long-hour duration and the present rates for short, overlapping loads of little inherent diversity, such as shop lighting. Domestic requirements, other than lighting, will probably be met, eventually, at an average figure of about 0.6d. per unit. Upon a calorific value basis this figure compares most favourably with coal gas distributed at 9d. per therm.

None of these figures include the enormous volume of business that they predict in house wiring and the installation of motors and other consuming apparatus. Supply authorities must cater for this in its entirety. It will call for large capital expenditure, but since all expenditure can be made profitable from the first through sales, hire-purchase, and simple hire, it can always sustain its own sinking fund, and is not an item of cost in electricity supply.

In conclusion, let it be said that the best-informed supply engineers throughout the country have confidence in the Electricity Commissioners and wish to see them vested with the greater authority which it was originally intended they should have. It is to be hoped that they will remodel the present constitution of joint electricity authorities by establishing smaller councils, with a local Commissioner. The present solemn, but inept, meetings, mainly attended by numbers of delegates from borough and urban councils and some other remarkable bodies, who advise without knowledge, and know as much about electricity supply as they do of gunnery ballistics, are a pitiful travesty of what should be a brisk and efficient zonal organisation. Surely chartered electrical engineers, to whom alone all the credit is due for the flourishing state of our industry to-day, should be the delegates—not the haberdasher or squire who happens to be upon a local council or some other vaguely interested body.

The Law of Contract.

By HERBERT G. CLAYTON, A.I.S.A.

Electrical contractors, especially those in a small way of business, frequently appear to be in some doubt regarding the legal rights and duties imposed on them by various contracts.

One of the first essentials to remember when two parties meet for contractual purposes is that they shall be *consensus ad idem;* that is to say, they must be of one mind regarding their intentions and the subject-matter of the agreement. Otherwise, mistake of purpose will arise, which may result in the contract being invalidated.

A contract has been defined as an agreement, enforceable at law, between two or more parties for the provision of goods or services, in exchange for money or other goods or services. There are three classes of contracts:—

(*a*) Specialty contracts (under seal).
(*b*) Simple (or parol) contracts.
(*c*) Contracts of record.

There are certain cases where it is absolutely necessary to have the contract made under seal, but in modern business this is not usually necessary, and this type of contract has been largely superseded by the simple contract, which, however, must conform to certain requirements to make it legally enforceable. One of the chief distinctions between these two classes of contracts is that the simple contract requires what is technically known as "consideration" to make it binding; whereas in a specialty contract this is unnecessary.

Furthermore, although contracts under seal must be written, witnessed, sealed, and delivered, simple contracts may be written, verbal, or implied. There are a few exceptions to this rule, and the one which is most likely to affect electrical contractors generally is the provision under the Sale of Goods Act, 1893 (Section 4), which enacts that goods to the value of £10 and upwards must be evidenced in writing and signed by the party placing the order, or, alternatively, that there must have been part performance of the contract.

It will be found that whenever a contract has been made there has been an offer to do a certain thing on the one part, and the acceptance has taken place on the other part. It is important to note that the acceptance of the offer must be unconditional, otherwise no contract has been effected, but simply a counter-proposal. The acceptance must also take place before the offer is withdrawn or revoked. As soon as acceptance of the offer takes place in the manner provided, it is conclusive; the contract is complete and cannot be revoked without cause for an action for damages arising.

An important point for electrical contractors is the legal position of offers (*e.g.*, estimates) sent by post. In these cases, the Post Office is deemed to be the agent for the party first using it. Consequently, when an offer is posted by a contractor, the Post Office is deemed to be his agent, and as soon as the customer receives the letter and accepts the terms, the mere act of posting his acceptance completes the contract. It is not necessary to wait until the communication is actually delivered. Conversely, if an offer is withdrawn by post, the revocation does not become effective until the letter has been delivered.

In making a simple contract, it should be noted that there must be valuable consideration to make the agreement enforceable at law. Consideration may be briefly defined as "some interest or profit accruing," which is required to show that it was not a gratuitous promise, as such a promise must be made under seal. For instance, if a promise is made to keep an offer open, this requires consideration, or, alternatively, it must be made in the form of a specialty contract. In addition, a promise to pay a smaller amount in discharge of a larger debt, necessitates consideration (however small) passing; otherwise, even if the smaller amount is accepted, there is nothing to prevent the creditor sueing for the balance at some future date.

The mater of contractual capacity is of importance to the contractor, and it should be noted that all contracts made with minors, except for necessaries, are void (Infants Relief Act, 1874). The exception to this statement is in the case of apprenticeship contracts, which are binding on all parties. The Court, however, if appealed to, will always review such contracts if harsh and unconscionable conditions are alleged, and if and when necessary will grant relief.

In the case of companies, any contract made outside the capacity of the powers conferred in the Memorandum of Association is *ultra vires* the company, and cannot be enforced or ratified. Any contract, however, made *ultra vires* the directors, but within the powers of the company itself, will be effective if ratified by the members of the company.

If there is breach of contract, the usual remedy is an action for damages. When, however, damages would not give the desired result, "*specific performance*" may be ordered by the Court; this sometimes applies to the sale of special goods which cannot be obtained elsewhere.

Damages may be liquidated (assessed in contract) or unliquidated (loss incurred through breach of contract). If a cause for action at law arises, the Court will scrutinise the liquidated damages clause very closely, and if it is apparent that it is really a penalty clause, in spite of its name, the Court will grant relief, the reason being that the Court holds that it alone has the power to inflict penalties.

The London Electrical Engineers.—27th (London) Anti-Aircraft Battalion, R.E. (T.A.).—Officer Commanding, Lieut.-Col. C. H. S. Evans, O.B.E.—The following orders have been issued for May, 1926: 304th Company, Major P. F. Foulger. 305th Company, Major A. W. M. Mawby, O.B.E., Tuesdays 7 p.m. to 9-30 p.m. 306th Company, Major F. C. Clarke. Monday, 7 p.m. to 9-30 p.m. The Easter Camp at Biggin Hill was well attended. On Friday and Saturday night an aeroplane was engaged by four searchlights; the standard of work done was uniformly good and special mention should be made of one light manned by recruits. All ranks were exercised with sound locators and were fortunate enough to be given a lecture and demonstration on three different types of aeroplanes, by their respective pilots.

Modern Electric Furnace Practice.

A Review of Some of the Methods of Installation and Operation.

By "LAPIS LAZULI."

In fixing the connections for an electric furnace the electrical engineer usually encounters numerous obstacles although, as a rule, none of them is particularly complicated. It may be helpful, however, to outline the process necessary to ensure the correct electrical conditions being maintained. At the outset it will be realised that "arcing" with a current like one employed in a steel-refining furnace is a matter of no small importance, and it largely falls to the duty of an experienced man to see that connections are properly made, and the clutch which carries the current to the electrode must exert an exceptionally firm grip on the carbon. Any slackness in screwing up the clutch, bolting and tinning the bus-bars, and other similar points would lead to disastrous results when the heat developed, as the arc at any slight space obtaining would melt away copper and carbon alike in a few moments. Similar results would be brought about if the arrangement which keeps the electrodes in proper alignment were allowed to move or even vibrate; also if the carbons came into contact with the side of one of the metal holders.

The bus-bars carrying the current from the transformer to the furnace are usually arranged overhead with the phases kept well apart; this is done with a view to preventing accidents when the furnacemen are carrying long pinches, rabbles, and other furnace tools.

The bus-bars are usually connected to the furnace by means of cables; in the arc furnace cables alone are used, but with the arc-resistance type it is customary to extend or divert the bus-bars close to the bottom connections, where a short length of cable is employed to permit the tilting of the furnace. A "box" lug is used for the bus-bar connection. The bus-bars are supported by iron bars, suitably insulated, and wooden spacers are employed. As a rule the transformers are housed in a small chamber adjoining the foundry, with a hole in the wall allowing the bus-bars to be connected directly to the transformer. This space, which is often left open, should be filled in with asbestos or any other suitable insulating material as soon as the installation is completed, as it prevents foundry dust finding its way into the transformer.

Most of the furnaces in this country are employed on a two-phase supply, the h.p. 3-phase supply from the generating station being dealt with by Scott-connected static transformers. The voltage is tapped off as required, with the aid of a selector switch controlled by an oil switch. Current and potential transformers are used in connection with the measuring instruments, and the supply is metered after each "heat," the consumption per ton of steel cast being recorded. Various controlling arrangements are employed on different furnaces, and the switches and other equipment are usually installed on a panel fitted into the wall of the furnace. To bring the current on to the metal in the hearth in the ordinary arc and arc-resistance types of furnace, the electrodes are carefully lowered until the arc is struck.

When the metal is cold the current is liable to surge violently, due largely to the irregular shapes of the pieces of scrap. This is apt to throw out the trip switch, which is brought in again after the electrodes have been raised. As the metal becomes melted the surging decreases, and at the final stages it ceases altogether. A small switch in circuit with the transformer switch coils is used to open the switch immediately in the case of emergency. This is only used in exigencies such as the furnace roof falling in, and arcing at the terminal boxes. The tilting mechanism of the furnace is provided with trip switches, so that the shell cannot be damaged by over-tilting. When the charge is ready for tapping, the electrodes are first raised, the ladle is then brought into position and the furnace tilted.

Arrangements are made to see that the electrodes are firmly fixed, although raised from the actual hearth, as in the tilting there is some risk of their being broken. In the older types of furnace the electrodes were continually being fractured by intermittent exposure, when hot, to the cold atmosphere. In the modern furnaces economisers are used which reduce these losses to a minimum. Current losses are one of the most important points in furnace efficiency, and the proper method of insulation at the leading in and out places of the shell is essential to success in this direction.

Although the Scott-connected transformers are provided complete with switches, it is the usual practice to transport them with the parts dissembled, the reassembling being effected at the steel works. From this it will be observed that such work necessitates a sound knowledge of the process, from the introduction of the high-pressure energy to the final stages of the melting. It should be added that the employment of current regulators has made electric furnaces more acceptable to the supply undertakings, as violent surging is eliminated.

Parliamentary News.

[By Our Special Parliamentary Reporter.]

The Electricity Bill.—We understand that the Electricity Bill will be considered by a Committee of the House of Commons during next week.

Electrical Energy Generated.—On April 15th Mr. H. Williams asked the Minister of Transport if he could state for the year 1925 the amount of electrical energy generated by all authorised undertakers and by railway and tramway companies; and the estimated quantity generated privately.

Colonel Ashley said that the returns submitted by authorised undertakers for the year 1925 had not yet been completely verified. The unchecked returns showed that approximately 6,685,700,000 kWh was generated during the year ended December 31st, 1925. With regard to railway and tramway companies, complete figures were not yet available for the calendar year 1925. Complete data in respect of private generation were not available. A rough estimate, however, from which he saw no reason to differ, was given in the Weir Report that the total national consumption from all sources in 1923 was about 200 kWh per head. During that period the energy generated by authorised undertakers amounted to 4,016,000,000 kWh.

[The last figure is that given in the Weir Report for "Units Sold." The energy generated was 4,572 million kWh.—Eds. Elec. Rev.]

Legal.

Alleged Theft of Electricity.

At the Newcastle (Staffs.) Police Court, on April 15th, John Stanley Cook, electrician, was summoned by the Corporation for the fraudulent abstraction and use of electricity. The Town Clerk, prosecuting, said that the defendant had employed for lighting purposes energy which had passed through a power meter, thereby securing it at a much lower rate. Evidence was given by employés of the Electricity Department to this effect, and one of them admitted that as the lamp in question was fitted it acted as a resistance for the charging of accumulators. Counsel for the defendant maintained that his client had no intention of defrauding the local authority; for twelve months he had openly charged accumulators in his shop, using a 200-W lamp as a resistance. Others in the district also charged batteries in that way. The lamp was only used for illumination purposes incidentally. The magistrates considered that a *prima facie* case had been made out, and committed the defendant for trial at the Borough Quarter Sessions.

Claim for an Electrical Installation.

At Southport County Court recently, Mr. G. H. Turner, electrical engineer, sued a Mrs. Howarth for £18 6s. 10d., balance of account for installing electric lighting to her order. The total bill was stated to be £48 6s. 10d., and his Honour Judge Dowdall said that he had had an electrical installation put in his house, with 27 lights and 30 points, at a cost of £35; it was lead-covered work.

P. Morley, electrical engineer, said that screwed tubing was very expensive. He would not estimate at under £2 a point.

For the defence, G. Littler, electrician, said that he estimated the job at £33 10s. He and an assistant could do the work in a fortnight at the outside; two hundred hours were unreasonable.

His Honour said that he thought the work might have been done more quickly. At the same time, he did not doubt that the time was put in. That would have been a suitable case for arbitration by an expert. He gave judgment for the plaintiff for £15 10s., with costs.

Correspondence.

Correspondents should forward their communications at the earliest possible moment. No letter can be published unless we have the writer's name and address in our possession.

The Fine Regulation of Resistance.

I am afraid I cannot see eye to eye with your correspondent who signs himself "Rheostat." His suggestion that a straight line type of rheostat with 150 contacts will meet all requirements for fine regulation scarcely needs refutation as more steps than this are frequently called for and supplied.

The Multistep Rheostat was designed to meet these requirements, and the fact that it gives 600 uniform steps when the designers of alternators and converters would be content with less, is surely no disadvantage.

During the introduction of railways there were doubtless gentlemen writing to the papers under appropriate pseudonyms pointing out the efficiency of the horse as compared with a steam engine, and whilst the difference between 150 and 600 steps is not so great, it nevertheless represents a small step in advance and one for which there has been a demand for some years past.

R. Amberton.

London, S.W., *April 16th*, 1926.

I read with interest Mr. Amberton's article on the Multistep Rheostat which appeared in your issue of the 9th, and have since had the advantage of seeing the apparatus.

But for the fact that a letter signed "Rheostat" and containing disparaging remarks was published in your issue of the 16th, I would not have encroached upon your space, as the article on the Multistep sets out its characteristics so clearly that I should have thought its utility would have been evident to all technical readers.

It solves an old problem—and in my opinion solves it remarkably well. Moreover, an inspection of an actual Multistep Rheostat shows it to be a simple, well-thought-out piece of apparatus, the only complication being in the inception of the idea, and not in its mechanical or electrical features.

One point occurs to me which Mr. Amberton did not emphasise in his article. With a limited number of steps of the order of, say, 100-150, it is not possible to specify the resistance and stepping of the Rheostat until after the alternator has been built and excitation curves have been plotted. The provision of 600 steps on the Multistep Rheostat will make it possible for the designer of an alternator to allow an ample margin of resistance and not to trouble himself about stepping. He will also have the advantage of having the Rheostat on hand and available as soon as the alternator is ready for test.

C. A. Ablett.

Manchester, *April 17th*, 1926.

I think that "Rheostat" has rather missed the point in his criticism of Mr. Amberton's apparatus.

The plain rheostat of 150 steps is hardly comparable in smoothness of working with one of 600 steps, and the 151 electrical connections needed are very many more than the 85 which Mr. Amberton requires. I do not suppose this gentleman ties himself to 600 steps, but presumably if a 150-step resistance is required it could be made on his principle with a similar large reduction in the number of electrical connections. The fewer these connections are, the easier it will be to keep them clear of one another.

F. A. Greene.

London, *April 17th*, 1926.

Three-phase, 4-Wire Distribution.

I should be glad if any readers would kindly inform me whether the variation of pressure is very marked on a 3-phase, 4-wire supply with unbalanced loads on the phases, using three 3-phase core-type transformers, connected star/star; also whether they would recommend the star/star connection in preference to the delta/star, having regard to the fact that the former permits of single-phase transformation in the event of one of the transformers becoming inoperative.

Inquirer.

April 15th, 1926.

Country-house Fires.

My attention has been directed to a letter in your issue of the 2nd inst., signed J. Price. I think that the statement that insurance companies do not "cause very careful tests to be made" needs some modification, as a perusal of the reports called for by the tariff companies specialising in engineering insurance will show that a definite report is required from the surveyor as to earthing and tests and examination of the earth wire. There are, of course, non-tariff companies which run engineering insurance as a branch and do not insist even on inspections, and it is at these companies that the brickbats should be thrown, as they will generally accept risks which an engineering insurance company has refused for some reason. The greatest stumbling block the surveyor meets with is very often the clients themselves, who object and sometimes refuse to allow the surveyor into those parts, labelled, on the dis. board "Principal Floor—1st Floor

Principal Rooms," &c., to take out lamps or test sub-circuits, so that an insulation test to earth from the main switch over the whole circuit is all that is possible; should the insurance company insist on a full series of tests, the only intimation is that the clients have changed their insurance to another company, generally one which does not insist on inspections. As regards insurance companies and qualified engineers, a little investigation would show that engineering insurance companies require quite as good qualifications of their surveyors as any manufacturer requires of his technical engineers. While it is generally agreed that installation inspections should be compulsory, something is also required to compel occupiers to allow proper tests to be made irrespective of the company with which they are insured.

Engineer Surveyor.

April 15th, 1926.

The Qualifications of a Salesman.

"Qui Pense" raises an important point in the qualifications of an engineer. Box numbers 9739 and 9709 in this issue of the REVIEW both mean:—"We require men who have paper qualifications and have done the same work. At some period of the future we will pay them the sum they have the wit to obtain from us, provided they fit in with our existing staff." Quite legitimate requirements and quite fair, but points to be remembered by men who hope that if they work hard and show keenness their salaries will follow the story books' rule.

I have applied for 100 situations, for 10 of which I held *almost complete* qualifications. Of these ten, three were advertisements "by law compelled" (this form of torture I hope will soon cease) and I was placed on the short list for five.

In the course of these interviews and thinking over them afterwards the following home truths were thrust on me: "Don't accept a temporary or junior job; you might be smythed for a better job or promotion. Don't be a new broom. Don't show too much enterprise or keenness for the job or take your coat off afterwards; this is taboo. See that the sport you take up is the correct sport. Don't like any other."

Nildes.

April 12th, 1926.

Overhead Transmission Lines.

I recently had the opportunity of inspecting an overhead transmission line erected in 1915 and, considering the time it was erected in what may be called open country, was astonished to find the condition of the galvanised ironwork. The channel arms, insulator pins, arm bolts, connecting earth wires, &c., were deeply encrusted with rust, not any galvanising remaining. I can personally vouch for the fact that the galvanising, when the line was erected, was good, and can only attribute the deterioration to the fact that, with the wind in a certain direction, the smoke from an adjacent railway service was carried across the line. Those who have control of overhead lines know, only too well, the difficulties of shutting down for sufficient length of time to allow any extensive repairs to be carried out.

It has occurred to me that, now that rustless steel and iron can be purchased at a more reasonable figure, it would be an eventual saving if all ironwork in the vicinity of the line conductors were made of this material.

If any of your readers have had any experience in this direction I should appreciate a statement of their views, as it seems to be a matter worth looking into, especially when one considers the projected developments.

James Nelson, M.I.E.E., M.I.R.E.

Bristol, *April 15th*, 1926.

Electric Vacuum Cleaners.

Mr. H. Harrison Dent's most interesting article on "Electric Vacuum Cleaners" in the ELECTRICAL REVIEW, contains much that is instructive and helpful to the trader and the user, and, to say the least, some food for thought for the manufacturer.

One must, however, realise that the average user, unless he be of an enquiring disposition, or engaged in engineering himself, has very often neither the time nor the inclination to conduct even the most simple tests when purchasing this appliance.

In fact, there are probably two reasons which make it somewhat difficult in these times to conduct tests as set forth in Mr. Harrison Dent's article, the first being the growing custom for the manufacturer to go direct to the purchaser, ignoring the contractor altogether, and secondly, the practice now, I think, fairly common, for the manufacturer to provide the demonstrator and to give the demonstration for the contractor, at the private residence of the customer.

The result is that the salesman, who is naturally enthusiastic about his machine, allows his enthusiasm to run away with his better judgment, hence wild and extravagant claims are not infrequently put forward by the salesman who desires to bring off the sale.

It is indeed a pleasure to come across cases where, as in the article in question, due recognition and generous tribute are paid to the advantages and merits of each type of machine. Those who have spent many years in the vacuum cleaner industry know only too well the difficulties that beset them and how hard it is to please the housewife. We realise that the salesmen of competitive firms are, not infrequently, anything but guarded in their condemnation of all machines except their own, forgetting that each machine as a rule has its good points, and, I have no doubt, its faulty ones.

It is constructive criticism, such as Mr. Dent's, that manufacturers can turn to in order to find food for thought. He is, however, treading on thorny ground when he speaks about the advantages or the disadvantages of the rotating brush; it is a point around which a sharp controversy always rages, and one which, I readily admit, is as far from being settled as ever.

It is an acknowledged fact that a vacuum which is too powerful does injure the fabric of the carpet if used frequently; at the same time the revolving brush has much to be said against it. I quite agree with Mr. Dent that the impact given to the carpet by the brush is not violent, but it is, nevertheless, an impact which will in time flick the nap of the carpet and take it into the bag. This constant flicking bruises, if I may be permitted to use this phrase, the nap, and it takes some little while before it becomes apparent; a careful examination of the dust in the bag will show this to be the case.

I trust Mr. Dent will pardon me when I take him up for saying that there is no evidence to prove that the revolving brush is injurious to the carpet. I would point out that the evidence is there all the same, without going to America to find it. The evidence is to be found in the constant complaints of users, who frankly say that they do find the nap of the carpet in the bag. Again, I myself have both seen and handled the evidence.

I gladly grant that a brush is a valuable asset; failure to do so would be unjust to the writer and unfair to the vacuum cleaner itself, but I very much doubt if the policy of the rotating brush is to be desired. I will go further, and will admit that, on a thick carpet, cotton is extremely difficult to pick up unless the end of the thread is standing up; a brush, however, is just as effective if fastened on to the front of the orifice of the machine, as in the case of the old type Croydon "Premier," and this practice is, I think, still carried out in the new model.

This brush is only put on when cleaning a room where sewing has been done; it can easily be removed and cleaned, and does not clog the orifice with hair and so forth, thus preventing the suction falling away.

If vacuum cleaners were used by highly instructed maids all would be well, but my experience is that the faults which arise are not so much faults in design as a complete lack of understanding on the part of the operator; she will look after her sewing machine like a young mother looks after her child, while the vacuum cleaner, because it is a vacuum cleaner, and therefore used for dirt and dust, can look after itself.

I do not think Mr. Harrison Dent's test with flour is quite a fair one, when testing a vacuum cleaner, but I will not complain about it. I am certain that he will find that flour retains moisture longer than sand, and is as a rule when dry, not so susceptible to crumbling as ordinary dirt the molecules of which more easily disintegrate as the machine or nozzle passes over it. The difference is very marked indeed.

The whole question of design is one which to my mind—and I speak from having many years' manufacturing experience in this branch of the electrical industry—calls for serious thought on the part of those who, in this country at any rate, are manufacturing cleaners with what I call an open bag. I am convinced more than ever by past experience that the external bag is neither sound nor healthy. It is astonishing what dirt gets through the bag back again into the room; every bag should be placed in the cylinder of the machine as in the case of the Electrolux and the Regina, and proper provision should be made to disinfect the air after it has passed through the dust chamber, and therefore, the bag, before it passes through the motor housing into the room. It means, I know, the scrapping of much material. If only the users could see the dust that is left on the disinfecting pad they would insist on its being adopted. As far as the provision of adjustments for lowering or raising the nozzle of the machine is concerned, I think that Mr. Dent will agree with me when I say that, speaking generally, they are satisfactory. The real trouble is that they are frequently ignored and, if not, are adjusted so carelessly that I do not think I am stretching the point when I say that in the majority of cases the machine is not given a fair chance. I am convinced that in many cases the orifice is as a rule either quarter or in some cases half open, most of the time the machine is in use. I only wish that more users would test machines before buying, then the machine worthy of merit would hold its own, but unfortunately, the public have, it appears, yet to learn that The Good House-keeping Institute is for the purpose of counselling those who want advice about purchasing domestic articles.

Before closing I should like to ask Mr. Harrison Dent what he considers is an adequate suction. I contend that nothing below 16 to 20 inches as measured with a manometer is really effective.

Alec. Sacré.

Sydenham, S.E.26, *April 16th*, 1926.

The Belgian Electricity Supply Industry.—Of six Belgian electricity supply concerns which have recently issued their report for last year, two are paying dividends of 7 per cent. for 1925, while the other four are paying, respectively, 9½, 10, 11 and 12 per cent.

The Properties and Engineering Uses of Stainless Steel.

By T. R. WILTON, M.A.

(*Abstract of a Paper read before the* Liverpool Engineering Society.)

Two of the causes of corrosion are direct solution of the material, resulting in a gradual wasting away, and galvanic action, causing selective local attack. In the case of wrought iron the first cause alone operates and in the case of steel both causes operate together. An addition of upwards of 9 per cent. of chromium to mild steel suffices to make the material insoluble in water, and therefore should suppress the type of corrosion which occurs with wrought iron. The problem of the dissimilar crystals in steel is overcome by hardening the material by heat treatment, causing the dissimilar crystals to dissolve one in the other and produce a homogeneous agglomerate. In the production of stainless non-corrosive material, we have to guard not only against solubility in water and dissimilarity of the crystalline bodies forming the structure of the material, but also against selective distortion. Stainless steel finished with heavy cuts will rust on the surface, and the same piece will be found immune from rust if this rough machined surface be removed by fine cuts and finished by grinding. The virtue of the polished surface is that only fine machining and careful grinding can produce it, and the distortion of the surface material is therefore avoided or eliminated. The verdict of experiments has been that contact corrosion diminishes steadily as the amount of chromium present in the steel rises, and that when a figure of 16 or 17 per cent. of chromium is reached, most forms of contact corrosion are eliminated.

It was found that stainless steels containing 16 or 18 per cent. of chromium, without other alloy, had a comparatively coarse crystalline structure, which could not be effectively refined by heat-treatment, and were consequently rather brittle. To overcome this difficulty small percentages of nickel were added, and the result is what is know as Twoscore stainless steel, in which general immunity from contact corrosion is obtained by the use of 17 or 18 per cent. of chromium and where a fine structure and good physical properties are restored to this high-chromium steel by the addition of 2 or 3 per cent. of nickel. Such a material may have in the heat-treated condition a hardness of between 50 and 100 tons per sq. in., according to the composition and the treatment, which makes it serviceable for the great majority of engineering applications. Chromium and Twoscore steels have similar characteristics to high carbon steels, in that they can be hardened, if reheated to suitable temperatures, and then either cooled in air or quenched in oil, or even, in extreme cases, water.

The presence of a high percentage of chromium in steel, in addition to making it non-corrosive at atmospheric temperatures, renders it also practically immune from oxidation at high temperatures. Straight chromium steels may resist oxidation or scaling up to temperatures between 800 deg. and 1,000 deg. C., or even higher, depending on their chromium content, and high-chromium-nickel alloys may resist oxidation up to temperatures of 1,100 deg. C. This property is extremely valuable in such applications as inlet and exhaust valves for internal combustion engines. Further, straight chromium steels are stronger at high temperatures than ordinary carbon steels, and the high-chromium-high-nickel steels, are stronger still at high temperatures. This property is extremely valuable in exhaust valves for internal combustion engines, enabling them to resist deformation under repeated impact when working red hot, and the possibility of constructing gas turbines in the near future probably turns upon the use of such alloy steels. In hydraulic machinery at a steel works the author has found the life of packings with stainless rams to be from 3 to 10 times that with ordinary steel or bronze rams.

For some reason that we cannot yet explain, stainless steel will not slide on stainless steel under pressure without seizing. The best slide-valve combination, known by the author, uses stainless steel for one of the sliding faces and a nickel-copper alloy for the other.

The blading of both impulse- and reaction-type turbines is another field which has been strongly invaded by stainless materials. The original machines were all bladed with bronze, which had many characteristics. It was readily produced in blading profiles, either by extrusion or by cold-drawing; it was easy to solder or braze in ways of shrouding bands; and it was soft and easy to machine. But with the advent of higher steam pressures and considerable superheats, bronze blading could no longer stand up to the work, and trials were made with steel. The most popular steel up till recently was mild nickel steel, generally 5 per cent. of nickel being used. Very high nickel steels (25 per cent.) have been used, but prolonged exposure to high steam temperatures induces extreme brittleness in this material. Cases of disastrous blade-stripping have occurred from this cause. But the low nickel steels, while physically stronger than bronze, suffered from corrosion, and in impulse turbines, from erosion and pitting. Within the past three or four years many of the largest turbine builders have adopted stainless-steel blades either exclusively or very extensively

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Wages in the Contracting Industry.—The National Federated Electrical Association, while unable to agree to the Electrical Trades Union's request for the restoration of the 5 per cent. "cut" made in 1923, has decided to revert to the National Sliding Scale Agreement of September, 1921, by which wages rise and fall in accordance with the cost-of-living index. The hourly rates to be adopted, as from the week covered by the pay-day April 30th or May 1st, are as follows:—Grade A, 1s. 10½d.; Grade B, 1s. 8¼d.; Grade C, 1s. 6¾d.; and Grade D, 1s. 5¼d. We are informed that this implies a general increase of ½d. per hour.

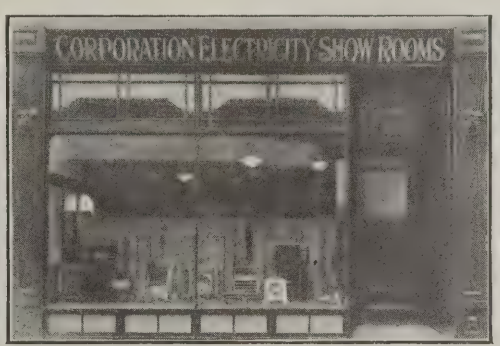
"Buy British Goods."—At a luncheon of the London Commercial Club last week, Sir Philip Cunliffe-Lister, President of the Board of Trade, said that the placing of orders at home not only meant more employment but increased the volume of trade and enabled prices to be reduced, giving British manufacturers a better position in foreign markets. The Government was practising what it preached. The G.P.O., one of the biggest buying departments, only purchased ½ per cent. of its requirements abroad, and the foreign purchases of the Stationery Office were only 1½ per cent. On behalf of the Government he appealed to local authorities to adopt the same policy; some were not buying British goods. Another matter in which these authorities could be helpful was in standardisation of requirements.

City Electricity Charges.—The report of the special committee on electricity charges, which was reviewed in our last issue, was presented to the City of London Corporation on April 15th. Mr. Deputy Sandle said that although the protests of the Corporation and the London Chamber of Commerce had borne some fruit, the prices were still too high. During the past seven years the companies had been able to put to reserves a sum equal to the whole of their ordinary capital, in addition to paying dividends totalling 101 per cent. in the case of the City of London Electric Lighting Co. and 82½ per cent. in the case of the Charing Cross Co. Mr. Sandle quoted figures showing that large firms in the City paid the companies twice as much for electricity as they would have had to pay Stepney Borough Council if that body had been able to supply them. The Corporation adopted the report which, it will be remembered, recommended that further action should be deferred until the results of the working of the London Electricity Acts were seen.

A "Stay-In" Engineering Strike.—The employés of Messrs. R. Hoe & Co., who were recently involved in the strike which threatened to lead to a national lock-out, suspended work without leaving the shops on April 14th. The reason for their action was stated to be the transfer of a foreman from one shop to another. The A.E.U. discountenanced the strike. The men resumed work on the following day, an agreement having been reached.

Unemployment.—The Employment Exchange registers for April 5th showed an increase—the first for some weeks. At that date the number of wholly unemployed persons was 1,049,800, as compared with 1,013,609 on March 29th and 1,166,353 on April 6th, 1925. The increase is said to be due to temporary stoppages at Easter.

The Canadian Budget.—Mr. Robb, the Dominion Finance Minister, introduced his Budget in the Canadian House of Commons last week. Among the points in his speech were announcements that the two-cents post would be restored on July 1st; that the British preferential tariff, after January 1st next, would only apply to goods conveyed directly to Canadian ports; that the income taxes would be substantially reduced; and that the duty on equipment for generating electricity for farm purposes was to be reduced to 5 per cent. under the British preferential tariff, and to 10 per cent. under the intermediate and general tariffs.



Registered Contractors.—The following contractors were approved for registration at a meeting of the Executive Committee of the National Register of Electrical Installation Contractors at its meeting on April 9th :—

Dodd, W. G., Ltd., Ayr.
Gilliver & Crouch, S.W.1.
Truman Electrical Co., Walsall
Henderson, T., Durham
Stearn, R. J., & Co., Luton
Brewster, G. M., Manchester
Gilkes, G., & Co., Ltd., Kendal
Milsted, C., & Sons, Tenterden
Sandon Motor & Engineering Co., Ltd., Liverpool.
Bannister, J. D., Padiham
Harvey, E .A., Nottingham
Hynds & Co., Belfast
Napier & Wheeldon. Hull
Glover, E. & H., Darlington
Elphick, C , Tunbridge Wells
Read & Partners, Ltd., S.W.1
Hardy, G. A., Leek.
Williamson, W. M., S.E.22
Beckett & Wheatley, Aston, Birmingham
Long, T. J., & Sons, Hexham-on-Tyne
Ajax Co., Ilford
Giffen, R. A., St. Albans
Andrews, H. A., Dublin
Laws, H., Ashington
Walsall Electric Supply Department
Cunningham, J., Pollokshields, Glasgow
Parkin, E., & Son, Newport, Mon.
Dalbeattie Electric Light & Power Co., Ltd.
Watson, A., & Dundas, Partick, Glasgow
Alden, F. G., Oxford
Bonham, J., & Co., Willington Quay-on-Tyne

New Municipal Showrooms.—On April 8th, the Mayor of Birkenhead opened the Electricity Supply Department's new showrooms in Grange Road West. The popular Jacobean style has been adopted in the decoration of the new premises and a very comprehensive collection of appliances has been gathered together. As will be seen from the accompanying illustrations the showrooms have an attractive exterior. A large number of lighting fittings are displayed, and each is separately switched to enable it to be demonstrated. In the same apartment vacuum cleaners, fires, fans, and many other appliances are shown. In accordance with the invariable practice a part of the showrooms has been set aside as an electric kitchen for the exhibition and demonstration of electric cooking, water heating, &c., while another section is devoted to laundry appliances—washing machines, a wash boiler, and an ironer.

Fittings Showroom.

Exterior.

Kitchen.

New Showrooms at Birkenhead.

PAISLEY.—The Electricity Department is acquiring extensive premises at 4, Abercorn Street, which are near the centre of the town, and these are to be altered and fitted up as meter workshops, cooker and repair stores and workshops, and they will also be used as temporary showrooms. It is hoped that when the widening of the principal street is completed, premises will be allotted to the Electricity Department for showrooms and offices.

ILKLEY.—As an alternative to spending £5,500 on a new showroom and offices for the Electricity Department, the Ilkley Town Council is considering a proposal to utilise the existing public library for the purpose.

Engineering Employés' Wages.—Last week the Engineering and Allied Employers' Federation offered to increase the "war bonus" paid to engineering employés by 2s. 6d. per week, but at the same time stipulated that the rates for overtime and night work should be reduced. The trade unions concerned stated that the offer was unacceptable, as many men would actually suffer a reduction of wages. They intimated that an offer of an increase of 2s. 6d. unhampered by conditions would be considered worthy of putting to the vote of their members.

At a meeting of representatives of trade unions in the London District, sanction was given to a ballot of members to decide upon strike action to enforce the men's claim for an increase of 20s. per week. The papers will be returnable by May 31st.

Brazilian Railway Electrification Contract.—It is reported from Rio de Janeiro that the Metropolitan-Vickers Electrical Export Co. has been awarded a contract for the electrification of one of the lines of the Western of Minas Railway.

For Sale.—Liverpool Corporation Electric Supply Department has for disposal six Willans engines, direct coupled to Siemens 550-V d.c. generators, seven Lancashire boilers, one 350-tube economiser, draught fan, feed pumps, &c. The Electrical and Mechanical Officer, Catterick Camp, invites offers for two 150-kVA, 440-V generating sets. Mr. H. J. Shaw will sell by auction on May 4th, at 3, 5 and 7, Southville, Wandsworth Road, S.W., wireless and electrical material, machinery, plant, &c., and on May 6th and following day, at 13, High Holborn, various stocks of wireless material, valve and crystal sets, &c. (See our advertisement pages today.)

The Swedish Industries Fair.—The Swedish Industries Fair will be held at Gothenburg from May 6th to 13th next, in the magnificent exhibition building of 30,000 sq. metres floor area, which was originally erected for the engineering section of the Gothenburg Exhibition a few years ago. It is said to be the largest timber structure in the world. The Fair this year will be particularly comprehensive, and certain sections, such as leather and rubber goods, radio, travelling requisites, arts and crafts, and a separate department of inventions should be especially attractive and interesting.

"British" Electrical Goods in New Zealand.—According to the *Daily Mail* Christchurch (N.Z.) correspondent, the Wellington Chamber of Commerce is investigating the action of certain English firms in shipping goods, notably electrical fittings, to New Zealand at prices greatly below those of other British makers. It is alleged that these goods are of German manufacture, are imported to England, and re-shipped to New Zealand as articles of British manufacture, thus paying lower rates under the preferential Customs tariff.

Electric Cookers for Employés.—At the Wakefield City Council meeting last week, objections were raised to a proposal that three members of the Electricity Department staff should be allowed the use of electric cookers in their homes for purposes of demonstration to prospective purchasers. Ald. Emmett said that the loan of the cookers would cost not more than £2 per year, and they were intended not for the men themselves but for their wives to demonstrate electric cooking to people who were interested and could thereby see practical daily use which was impossible in a showroom. The employés concerned paid for the energy used and it was a very cheap advertisement for the department. The recommendation was approved.

Book Notices.—"Chemical Engineering and Chemical Catalogue" (pp. 366). London: Leonard Hill. Price 15s. This is the second edition of a very complete guide to the chemical industry and its products, and electrical manufacturers are well represented. A foreword and an article on "Corrosion" are contributed by Sir Robert Hadfield, Bart., and a large amount of data and tables is given. The volume has been edited by Mr. D. M. Newitt, Ph.D., D.I.C., &c.

"The English Electric Journal," March, 1926. London: The English Electric Co., Ltd.—This issue of the journal is of particular interest for its contents consist mainly of pictures of plant supplied to all parts of the world by the company. Railway electrification is given special prominence.

"An Introduction to Refrigeration." Published by the Technical Section, Association of Engineering and Shipbuilding Draughtsmen, 96, St. George's Square, London, S.W.1. Price 2s.

"Relay Handbook, 1926." Pp. 13 + 1,001; figs. 749. Published by the National Electric Light Association, New York. Price to members, $4.00; non-members, $6.00.

"Telephone Repeater Stations."—This 32-page, fully illustrated handsome souvenir publication from the Peel-Conner telephone works of the General Electric Co., Ltd., is a reprint of a description of the repeater stations on the London to Bristol trunk telephone cable. They were the first two of the new series of permanent stations to be completed in connection with the underground trunk telephone cable system, and were put in service in June, 1924, since when they have been in constant commercial use without developing any kind of fault whatsoever. The whole of the repeater equipment was manufactured at the Peel-Conner telephone works at Coventry, and the power plant at the Witton works of the G.E.C.

"Les Moteurs à Explosion," by E. Marcotte. Pp. 216; 61 figs. Paris: Librairie Armand Colin. Price 8 fr. 50.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLIV, No. 4. April, 1926. New York: The Institute. Price $1.

Recent Contracts.—MESSRS. FERRANTI, LTD., inform us that they have recently secured two important contracts from the Southern Hemisphere. The first is for six 10,000-kVA, 3-phase, 33,000-V transformers for the Sydney City Council; the other comprises seven 5,000-kVA, single-phase transformers for use as 15,000-kVA, 110,000-V groups, for the New Zealand Public Works Department. The total value of the two orders is approximately £40,000.

New Metro-Vick Showrooms.—On Monday last a party of the Press was conducted over the new showrooms, offices, &c., which the Metropolitan-Vickers Electrical Co., Ltd., and Metro-Vick Supplies, Ltd., have opened in Charing Cross Road, W.C.2. The company was afterwards entertained to luncheon at Frascati's Restaurant. Sir Philip Nash, K.C.M.G., presided, and in a short speech welcomed the visitors, stating that this country had three great things in its favour, electrically speaking:—We had a great deal of headway to make up; we had the ability and the finance to undertake any task; and there existed a most able Press. The company realised that the domestic appliance business had only just started growing, and it had become essential for manufacturers of heavy plant to produce smaller current-consuming devices which brought in a steady income. Sir Philip said that the company was erecting similar premises in Glasgow to cover the important Scottish area.

Local Exhibitions.—KEIGHLEY.—We reproduce herewith a view of the recent exhibition organised by the Corporation Electricity Committee in the Keighley Municipal Hall. The

Electrical Exhibition at Keighley.

show was well supported by both national and local concerns, as will be inferred from the picture.

BRADFORD.—The Corporation Electricity Committee has been awarded a silver medal (second prize) for its stand at the recent Bradford Ideal Homes Exhibition. It is reported that good results were secured from participation in the show.

EVESHAM.—We recently made mention of the electrical exhibition at Evesham, organised by the Shropshire, Worcestershire, and Staffordshire Electric Power Co. One of the

The B.T.-H. Stand at the Evesham Exhibition.

exhibitors at this show was the British Thomson-Houston Co., Ltd., which displayed lighting fittings and domestic appliances upon the stand depicted in the accompanying illustration. The company also supplied the lighting fittings for a model shop window arranged by the organisers.

MORECAMBE.—In connection with the Morecambe Trade Revival Fashion Exhibition being held at the Winter Gardens from April 21st to 28th, the Morecambe Corporation Electricity Department has 10 stands displaying electricity in the home. Demonstrations are being given of cookers, vacuum cleaners, washing machines, boilers, irons, &c., and in addition there are special films and illustrated lectures. Mr. W. H. Wilkinson, A.M.I.E.E., is also exhibiting a variety of labour-saving devices, including ventilating fans, cookers, geysers, &c., and Mr. W. B. Duckworth, radio and electrical engineer, also has an exhibit.

Lead.—Messrs. James Forster & Co. reported on April 17th that there was little change in the general position. It was hoped that present values for lead would bring out more buying from consumers but there was no evidence of this, the demand from cable makers in particular being distinctly disappointing. It seemed likely that until definite signs of an upward movement appeared consumers would continue their policy of buying from hand to mouth. The Board of Trade returns for March showed:—Imports, 19,148 tons; exports, 1,897 tons, leaving for home consumption, 17,251 tons.

Birmingham National Trades Exhibition.—The exhibit of the City of Birmingham Electric Supply Department at this show, which is open from March 15th to May 8th, takes the form of three model rooms of an "all electric" house, *viz.*, dining room, bedroom and kitchen. In the dining room the furniture is dark oak with fittings of oxydised copper. A three-light lantern fitting is placed in the centre of the room for general lighting, and two drop lights fixed near the overmantel are a unique feature. A reading lamp and floor standard are also provided. The heating is supplied by a "Magicoal" fire, supplemented by a 2-kW "Premier" fire. Other appliances shown are a hot plate, small urn, kettle, fan and vacuum cleaner. A bowl fitting is fixed for lighting the bedroom with a cord adjustable pendant over the dressing table, and a table standard near the bed. A tray containing a coffee percolator, toaster, &c, is placed by the bedside. On the dressing-table are an electric hair dryer and a pair of curling tongs. Two fires are shown, a 3-kW "Arora" and a 1-kW

The Birmingham Electric Supply Department's Stand.

"Sturge-Baker." In the kitchen there is an interesting display of domestic apparatus consisting of a "Heatrae" geyser, a "Frigidaire" automatic electric refrigerator, a cooker as supplied on hire, a "Creda" wash boiler, a "Giljay" battery-charging set, &c. A totally-enclosed lighting unit is installed, provided with an adaptor for use with small appliances, kettle, iron, &c. This "room" is illustrated in the accompanying picture.

New Businesses Registered.—The following businesses have recently been registered under the Business Names Act:—

Rotherham Wireless Co. (radio factors), 151, Fitzwilliam Road, Rotherham.

R. Egerton & Co. (electrical engineers and contractors), 26, Pear Tree Street, Derby.

F. H. Barrett & Co. (electrical, radio, and general engineers), 2a and 2b, Church Street, Staines.

Canning Electro-Plating and Engineering Works (electro-plating and scientific instrument makers), 1a, Canning Crescent, Wood Green, N.22.

The Regent Radio Co. (radio distributors), 50-51, High Holborn, W.C.

The London Radio Store (wireless sets and components), 107a, High Street, Uckfield, Sussex.

J. W. Markland (electrician), 89, Old Street, Ashton-under-Lyne.

Gillitt & Co. (sports and wireless outfitters), 22, Lowther Street, Whitehaven.

Central Electric Co. (Watford) (electrical engineers and contractors and wireless dealers), Water Lane, High Street, Watford.

Volume Crystal Manufacturing Co. (wireless and sports goods), 234, Green Street, Bethnal Green, E.2.

Trade Announcements.—The LONDON ELECTRIC WIRE CO. AND SMITHS, LTD., have opened branch offices as follows: Newcastle, 93, Pilgrim Street; Manchester, 19a, Brazennose Street; Liverpool, 63, Moorfields; Leeds, 2, Cabinet Chambers, Basinghall Street. An agency arrangement has been made with Mr. A. Tracy Cross, Circus Street Chambers, East Circus Street, Nottingham. Stocks of cotton, silk and enamelled wire, resistance wires, "Glazite" and "Lewcos" inductance coils are now held in Glasgow, Newcastle, Manchester, Liverpool, Leeds, Nottingham, Birmingham, Coventry, Cardiff, and London.

MESSRS. KENT BROS. ELECTRIC WIRE CO. & E. H. PHILLIPS, LTD., have appointed Messrs. John Grogan & Co., 95, Waterloo Street, Glasgow, as their representatives for Scotland.

THE MAIDENHEAD RADIO CO has taken premises at 40, Queen Street as showrooms for wireless apparatus and electrical supplies.

MR. W. S. JACKSON, electrical contractor and wireless expert, has opened premises at 8, Walton Road, Stockton Heath, Warrington.

MESSRS. JOHN RICHARDS & CO. (ELECTRICAL ENGINEERS), LTD., having opened branch offices and showrooms at 22, Bore Street, Lichfield, ask for catalogues, &c.

MR. H. A. GREENFIELD, electrical engineer, &c., Norwich, has removed to 48, Bethel Street.

MR. J. E. FOWLER, electrical engineer and contractor, has opened new showrooms and offices at Corn Exchange Buildings, Market Street, Wakefield.

Communications for MESSRS. FESCOL, LTD., should be sent to their new works: 101, Grosvenor Road, Westminster, London, S.W.1. Telephone Nos.: "Victoria 2622 and 2623."

THE UNIVERSAL ELECTRIC LAMP CO., LTD., is removing on 26th inst. to larger offices at 35, Hatton Garden, London, E.C.1.

On the retirement of Mr. Donald Murray from business, the agency for the Morkrum-Kleinschmidt Corporation, of Chicago, has been taken over by STANDARD TELEPHONES & CABLES, LTD. (formerly Western Electric Co., Ltd.), of Connaught House, Aldwych, W.C.2. The Standard Company has already had considerable experience in printing telegraph apparatus, principally in connection with the Western Electric Multiplex system, and the addition of the Morkrum-Kleinschmidt apparatus, including the "Teletype," will materially increase the activities of this company in the telegraph field. It is contemplated that, with the development of its factories which is now taking place, the Standard Company will commence manufacturing "Teletype" apparatus in England.

Catalogues and Lists.—MESSRS. GEORGE ELLISON, Perry Barr, Birmingham.—List No. 327, containing illustrated details of totally-enclosed brake solenoids or power magnets for d.c. circuits up to 300 A and 660 V.

BATTERIES, LTD., Crabbs Cross, Redditch.—List No. 2, describing the company's "Nife" accumulators (nickel-iron type). Priced.

MESSRS. L. WEEKES (LUTON), LTD., Luton, Beds.—A priced and illustrated catalogue of switch- and fuse-gear, including mining-type apparatus.

MESSRS. BERRY, WIGGINS & CO., LTD., Stratford Market, E.15.—A list of electrical compounds for joint boxes, cable troughs, accumulator sealing, &c.

THE D.P. BATTERY CO., LTD., Bakewell, Derbyshire.—An illustrated booklet describing electric locomotives for military purposes.

MESSRS. LACY-HULBERT & CO., LTD., 91, Victoria Street, S.W.1.—List E.O.3, dealing with the "Boreas" electrically-driven tire inflator.

MESSRS. FERRANTI, LTD., Hollinwood, Lancs.—Pamphlets Wa. 401, 402, and 403, describing the "Ferranti" l.f. radio transformer. The last pamphlet is a set of instructions as to the proper use of the instrument. Also Pamphlet Ta 156, dealing with high-voltage d.c. testing equipments.

THE WEINBAU INCANDESCENT & ELECTRICAL CO., 327-335, Commercial Road, E.1.—A net price list of electrical materials and accessories.

SWITCHGEAR & COWANS, LTD., Elsinore Road, Trafford Park, Manchester.—Descriptive Section No. 3-2, advertising remote controlled safety gate-end starters with special protection for use in mines.

BRITISH BROWN-BOVERI, LTD., Trafalgar House, Waterloo Place, S.W.1.—Pamphlet 893E, containing an illustrated description of electric locomotives supplied to the Paris-Orleans Railway.

ELECTRICAL APPLIANCES (BLACKPOOL), LTD., 5, Bloomfield Road, Blackpool.—A priced and illustrated folder advertising switch-plugs and sockets.

VENTEX ELECTRICAL CO., 220, Cooksey Road, Small Heath, Birmingham.—A price list of "Ventex" ironclad cut-outs, distribution boards, &c., and a pamphlet dealing with the "Ventex" time switch.

STELLA LAMP CO., LTD., Winchelsea Road, Harlesden, N.W.10.—An illustrated and priced catalogue of vacuum and gasfilled lamps, including special types.

THE IGRANIC ELECTRIC CO., LTD., 149, Queen Victoria Street, E.C.4.—Publications Nos. 6 215, 6,218, and 6.220, dealing, respectively, with "Xilos" inductance coils; the "Indigraph" vernier knob and dial; and the "Igranic" super-heterodyne receiver outfit. Illustrated and priced.

MESSRS. MARRYAT & SCOTT, LTD., 57, Hatton Garden, E.C.1.—A well-produced catalogue of electric lifts (91 pp.). The publication is profusely illustrated and contains several pictures symbolising the main characteristics of the company's lifts.

KODA (LONDON), LTD., Koda Works, Byfleet, Surrey.—A pamphlet advertising primary cells and batteries.

MESSRS. S. G. LEACH & CO., LTD., 26-30, Artillery Lane, E.1.—List LM.1/26, containing details and illustrations of "Leach" motors, dynamos, motor-generators and converters.

Bankruptcy Proceedings.—JOSEPHINE R. HEREFORD-LAVEY and VIOLET DE FRECE (carrying on business as the Radio Cash Stores), 371, Upper Street, Islington, Leeds, and Nottingham.—The debtors attended before Mr. Registrar Mellor at the London Bankruptcy Court on April 13th for public examination upon a joint statement of affairs showing liabilities of £1,111 and assets "nil." The Official Receiver reported that, in addition to the above liabilities, there were claims amounting to £361 which had not been scheduled by the debtors, and the accounts would consequently have to be amended. According to the debtors' statements, in June, 1924, in partnership with another person, they began business as radio accessories dealers at Leeds, the debtor De Frece providing in all £800 capital. The business was successful, and in August, 1924, the third partner retired, receiving £150. The debtors subsequently removed it to other premises in Leeds, and later opened similar businesses at Islington, Swansea, and Nottingham, all of which were placed under management. The trading resulted in a loss of £300. In February, 1925, execution was levied at all the business premises at the instance of a judgment creditor, and the whole of the stock was seized and sold and the business ceased. The debtors attributed their failure to a slump in the wireless trade, to the heavy increase in the overhead expenditure in connection with branches, and to bad management and irregularities on the part of certain employés. The examination was adjourned for a month, and the debtors were directed to lodge the amended accounts within a fortnight.

JOHN RUSS, electrical goods dealer, 22-23, Verulam Street, Gray's Inn Road, W.C.—This debtor attended before Mr. Registrar Mellor at the London Bankruptcy Court on April 13th for public examination upon accounts showing total liabilities of £8,641 (unsecured £8,630) and net assets valued at £7,446. In reply to Mr. Armstrong, Official Receiver, the debtor stated that he was born in Schleswig-Holstein; he came to this country in 1899, and was naturalised in 1910. He served in the Army in England from August, 1918, till February, 1919. In October, 1920, he entered into an agreement with a German company under which he carried on business in partnership with them in the sale of electrical goods, first from his private address at Highams Park and afterwards at Verulam Street, the arrangement being that the company should finance the business, which he managed without supervision. The agreement was cancelled in 1924, and he continued the business on his own account from the same address until, realising his hopeless financial position, he filed his petition in August, 1925. He attributed his insolvency to the failure of the before-mentioned German company, as his partners in the business, to finance it to the extent to which they had promised; to liability for the payment of partnership debts since the date of the cancellation agreement, &c. The assets included a sum of £5,914, which he alleged to be owing to him from the German company. The examination was concluded.

A. E. BURR (trading as Read & Burr), wireless manufacturers' agent, late of Hammersmith Terrace, W., and Red Lion Court, Fleet Street, E.C.—The first meeting of creditors was held on April 16th at the London Bankruptcy Court. The receiving order was made on April 1st upon the petition of the Rexo Engineering Co. According to the debtor's statement, in April, 1925, he rented a stand at the British Empire Exhibition, and the venture proved a failure, and subsequently, having come to the end of his capital, he ceased business. The liabilities were roughly estimated at £400, and no assets of any description were disclosed. The debtor attributed his failure to the small turnover and heavy expenses at Wembley, depression in wireless trade in 1925, and insufficient capital. The case was left with the Official Receiver to be wound up in bankruptcy.

E. H. NEWMAN and DORIS E. NEWMAN (trading as Newman and Co.), radio and electrical engineers, Shepherd's Bush Green, W.—These debtors attended on April 16th before Mr. Registrar Francke at the London Bankruptcy Court for public examination upon accounts showing liabilities of £793, against assets valued at £45. They commenced business in partnership in January, 1925,. The failure was attributed to lack of capital, heavy overhead expenses, and trade depression. Upon the application of the Official Receiver, the debtors were ordered to furnish cash and goods accounts, and their further examination was adjourned until June. The following are creditors:—

	£		£
Birnard's Press	33	Morton, Burt & Co., Ltd. ...	28
Goswell Engineering Co. ...	111	Radions, Ltd.	67
S. T. Hill	65	Sparks Radio Supplies, Ltd. ...	27
J. Hollingsworth	125	Stella Products	31
Listron	32	Sylvex, Ltd.	35
Linno Radio Valve Co. ...	28	Wireless Electric Wholesale Co.	30

W. J. KIDD, electrical engineer, Townhall Street, Enniskillen.—This debtor appeared before Mr. Justice Brown, in the Ulster Bankruptcy Court, Belfast, on April 16th, for examination. Kidd said that he started business in August, 1924,

with a capital of £30, and was adjudicated bankrupt in February last with liabilities amounting to £1,500. He said there were debts due of £85. He had not kept any books. The examination was adjourned.

C. Hubbard, 13, Magdalen Street, Norwich, electrician and wireless dealer.—The receiving order in this matter was made on March 19th on debtor's own petition. The statement of affairs shows liabilities of £472, while the assets are estimated at £709, from which preferential claims of £32 have to be deducted, leaving net assets of £677, or an estimated surplus of £205. In October, 1923, debtor started trading on his own account at Magdalen Street, Norwich, having saved about £300, which was his available capital apart from stock which he had created in his spare time. The Official Receiver states that debtor seems to have allowed too much credit and has not had sufficient capital at his disposal to carry on business on these lines. First meeting, April 23rd, at the Official Receiver's office, 9, Queen Street Chambers, Norwich; public examination, May 11th, at the Shirehall, Norwich.

W. C. Rhodes, trading as L. J. Palmer & Co., Corporation Street, Birmingham, electrical engineer and contractor.—The application for discharge of this debtor was heard on April 15th at the Court House, Birmingham. The proceedings took place in 1925. The liabilities totalled £749 and the assets realised £80, a dividend of 1s. 8d. in the £ being paid. An immediate discharge was granted, subject to debtor's consenting to judgment for £50.

A. North and F. North (A. & F. North), wireless and electrical engineers, 38, Bradford Road and Market Place, Dewsbury.—Receiving order made April 9th, on debtors' own petition. First meeting April 20th, public examination May 6th, both at the County Court House, Dewsbury.

J. McFadden, electrician, 177, Higher Hillgate, Stockport.—Receiving order made April 9th on debtor's own petition.

M. Kelly, radio apparatus dealer, 12, Jackson's Row, Manchester.—Trustee, Mr. J. F. Warburton, 28, Queen Street, Manchester, appointed April 9th.

Company Liquidations.—Bucks. Electric Wire and Engineering Co., Ltd., North Street, New Bradwell.—A meeting of creditors was held on April 15th at the office of Messrs. Corfield & Cripwell, E.C., when the chair was occupied by Mr. W A. J. Osborne, who had been appointed to act as the liquidator in the voluntary liquidation of the company. A statement of affairs was presented which disclosed liabilities of £2,879, and net assets of £290, leaving a deficiency of £2,589. Mr. Osborne stated that the company was formed in March, 1924, with a nominal capital of £500. The turnover from January, 1925, to February, 1926, was £4,822, and there was a gross profit of £644, and a net loss of between £500 and £600. When the company was formed, it took over liabilities of £1,183, and the whole of them had been discharged. In August, 1924, £300 was raised on debentures, and in the following month a further £200. In March, 1925, a further £800 was raised on debentures in favour of Mr. Bullard. At a later date a Mr. Kibble advanced £1,000 on the security of the freehold premises, and the debenture holder was paid out. It was decided that the voluntary liquidation of the company should be continued with Mr. Osborne as the liquidator. The following are creditors :—

	£		£
Bowen Davies, E.	22	Kaye, E. E., Ltd.	275
Coquantin, M.	100	Midland Auto & Engineering Co.	22
Derricott, ...	60	Musk, Beattie H.	43
Gibert, J., & Sons	168	Patman, H.	255
Gurney, A. W.	43	Powell Bros.	194

Kibble, A. J.	82		

Wireless Installations, Ltd.—Liquidator, Mr. G. D. Pepys, Official Receiver, Carey Street, W.C., released April 13th.

British Electric Vehicles, Ltd.—A petition for the winding up of this company has been presented to the High Court by Batteries, Ltd., of Crabbs Cross, Redditch, creditors, and will be heard in London on April 27th.

Union Electric Welding Co., Ltd.—A meeting of members is called for May 18th at 81, Cannon Street, E.C., to hear an account of the winding up from the liquidator, Mr. L. O. Huggins.

Tele-Dis Services (Founders Co.), Ltd.—Last day for proofs for dividend April 28th. Liquidator, Mr. G. D. Pepys, Official Receiver, Carey Street, W.C.

Dissolutions of Partnership.—Egerton, Jobey & Co., electrical engineers and contractors, 26, Pear Tree Road, Derby.—Mr. H. W. Jobey and Mr. R. E. Worsley have dissolved partnership. Debts will be attended to by Mr. Worsley.

Thornton & Evans, electrical and motor engineers, 37, Regent Street, and The Garage, Lambpit Street, Wrexham.—Mr. S. Thornton and Mr. A. Evans have dissolved partnership.

Private Arrangements.—P. R. Masheder, wireless engineer, trading as "Radio Services," 63a, Stanley Road, Bootle, Liverpool.—A meeting of creditors was held recently, at the offices of Mr. Parkin S. Booth, Liverpool, when a statement of affairs was submitted which showed liabilities of £501, and net assets of £114, leaving a deficiency of £387. It was reported that the debtor commenced business at his present address in December, 1924, with a borrowed capital of £200. He was able to trade successfully until the end of 1925, when the takings fell off considerably, mainly owing to the fact that a fire broke out on the premises and destroyed a large number of batteries which he used in his battery service. A resolution was passed confirming the deed of assignment already executed with Mr. Booth as trustee, whilst a committee was appointed consisting of the representatives of the General Electric Co., Ltd., Messrs. Baxendale Bros., Ltd., and Messrs. Wm. Allan & Co. The following are creditors :—

	£		£
Allan, Wm., & Co.	63	Baxendale Bros.	61
Anderson, Thomas & Co. ...	201	General Electric Co., Ltd. ...	43
Blake, J., & Co., Ltd.	33	Pulford Bros., Ltd.	33

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report, April 20th: Copper (electrolytic) bars, £65 5s., 15s. inc.; ditto ditto sheets, no change; ditto ditto wire rods, £75 5s., 15s. inc.; ditto ditto h.c. wire, 9 7/16d., 1/16d. inc.

Messrs. James & Shakespeare report, April 20th: No change in the prices for copper bars (best selected), sheet and rod; English pig lead, £29 10s., £1 dec.

Messrs. Edward Till & Co. report, April 20th: India-rubber, Para fine, 1s. 11d., 2d. dec.

Our Foreign Trade.—March Figures.—The following were the values of imports and exports of electrical goods and machinery during March, 1926 :—

	March, 1926.	Inc. or dec.	3 months, 1926.
Imports—			
Electrical goods and apparatus	287,955	− 44,790	−217,324
Machinery	1,264,400	+188,941	+251,683
(Electrical machinery)	117,155	− 10,854	− 10,384
Exports—			
Electrical goods and apparatus	994,854	+ 80,562	−161,530
Machinery	4,317,449	− 35,136	− 89,500
(Electrical machinery)	484,413	− 490	+ 8,322
Re-exports—			
Electrical goods and apparatus	20,560	+ 5,627	− 16,135
Machinery	121,078	− 2,212	+ 749
(Electrical machinery)	11,758	+ 6,616	+ 7,030

Lighting and Power Notes.

Ayrshire.—Electricity Supply.—The Electricity Board is considering the question of a supply of electricity to Maybole and Turnberry.

Bath.—Loans.—The Town Council has received sanction to a loan of £8,500 in respect of excess expenditure on mains and services, and £15,000 for new works. A further loan of £5,000 for expenditure on sub-stations for the next two years has been applied for.

Bolton.—Loan Sanctioned.—The Electricity Commissioners have sanctioned the borrowing of £75,000 for mains in connection with the Corporation's electricity undertaking.

Brookwood (Surrey).—Electricity Supply.—A supply of electricity will shortly be available in Brookwood and Pirbright from the power station of the Woking Electric Supply Co., Ltd. The charges will be as follows :—Lighting, 7d. per kWh. Heating: Winter quarters, 3d. per kWh; summer quarters, 1½d. per kWh. Cooking: Winter quarters, 2½d. per kWh; summer quarters, 1½d. per kWh.

Burton-on-Trent.—New Plant.—At a recent meeting of the Town Council, the chairman of the Electricity Committee said the Committee had had under consideration the best method to adopt to make its generating station safe for the next two or three years, having regard to the Electricity Bill at present before Parliament. After careful consideration it was decided to increase the capacity of the plant by from 4,000 to 5,000 kW. When this extension was complete, the Corporation would have a stand-by in the old machine in case of a breakdown of one of the bigger machines. The cost would be approximately £30,000. A further extension of the system in South Derbyshire, which had been already sanctioned by the Council, would cost approximately £20,707. It was decided that application be made for permission to borrow the necessary money.

Carlisle.—Electricity Extensions.—The Town Council has decided to carry out mains extensions at a cost of £5,641. The electrical engineer is to prepare a definite scheme with a view to an application being made for an Order authorising the Council to extend its area of supply.

Cleobury Mortimer.—Electricity Supply.—The Rural District Council has given its consent to the erection of overhead wires by the Shropshire, Worcestershire, and Staffordshire Electric Power Co. for the supply of electricity to the town. The company will supply at from 7d. to 8d. per kWh for lighting, and at about 1½d. per kWh for power, heating, and cooking.

Continental.—France.—The Société de Transport d'Energie Electrique du Nord, in conjunction with the Société Electricité et Gas du Nord, is engaged in a considerable extension of the electricity supply service in the war-devastated area of the country. At Jeumont a new 7,500-kVA, 10,000/45,000-V transformer is being installed; three similar sets are being added to the sub-station of Fourmies, two of which will replace 2 500-kVA sets that are to be transferred to Cambrai and Bavay; two similar sets are being added to the trans-

former station at Hirson, while at Bavay a new sub-station is being erected which will be equipped with two 15,000/45,000-V transformers—one of 2,500 kVA from the Fourmies station, and one of 1,400 kVA from the Cambrai station.

The Société des Forces Motrices de la Selune, of Avranches, has recently secured a concession to establish a 30,000-V transmission line between Pontaubault (Manches) and Sainte-Brice-en Coglis (Ile-et-Vilaine) with the object of affording a supply of electricity to a large number of rural communes in that area.

East Ham.—ELECTRICITY SUPPLY.—The Electricity Committee has decided to lay a cable in connection with a supply of electricity to Manor Park, at an estimated cost of £2,000.

Edinburgh.—INQUIRY.—The Commissioners under the Private Legislation (Scotland) Act recently held an inquiry into a draft provisional Order promoted by the Corporation for general powers. The chairman asked that the clause to enable the Corporation to carry forward surpluses and deficiencies on the electricity undertaking should be specially considered. The Minister of Transport did not agree that deficiencies should be allowed to be carried forward. The Corporation thought that in certain cases it might be desirable to carry forward a deficiency, particularly when by so doing charges for electricity might be kept uniform. The Commissioners having considered the point, intimated that they desired to give effect to the suggestions of the Minister of Transport. In view of this decision, it was stated that the clause would be withdrawn by the Corporation.

Fowey.—ELECTRICITY SCHEME.—It was reported at a recent meeting of the Town Council that the St. Austell and District Electric Light & Power Co., Ltd., is shortly to commence laying an underground cable through the town in connection with the electricity scheme.

Fylde.—ELECTRICITY SUPPLY.—At a recent meeting of the Rural District Council it was decided that at the next meeting of the Council a resolution should be passed agreeing to Blackpool Corporation giving a supply of electricity to the townships of Marton and Carleton.

Glasgow.—ELECTRICITY IN SMALL HOUSES.—In connection with the scheme for laying mains to Possil housing estate, the electrical engineer recommends acceptance of similar charges to those made by the Gas Department for gas mains, namely, £5 15s. 8d. per house.

Hamilton.—HYDRO-ELECTRIC SCHEME POSTPONED.—In connection with the proposed hydro-electric installation at Clyde Bridge, the Corporation Electric Lighting Committee reports that it has considered the offers received for the scheme, the lowest being £38,949. The view of the Committee and of the resident engineer (Mr. Cooper) is that the project is sound from an engineering point of view, but meanwhile, owing to the large increase in the capital costs, it is not economical. The Town Council has agreed to wait until the effect of the Government's scheme for the supply and regulation of electricity has been ascertained.

Haworth.—INAUGURATION OF SUPPLY.—The electricity supply for the district was formally inaugurated by the chairman of the Urban District Council on April 10th. Electricity is obtained from Keighley in bulk at a pressure of 6,600 V, and is reduced at the sub-station for distribution. The cost of the scheme was approximately £6,000. Mr. Maxwell Webber is electrical engineer to the Council.

Hitchin.—INQUIRY.—The Ministry of Transport, on April 7th, held an inquiry into the application of the North Metropolitan Electric Power Supply Co. to erect an overhead line in the urban area for the transmission of electricity. The Urban District Council had refused its consent. For the company it was stated that it was desired to have a trunk line from Stevenage to Hitchin, and the Hitchin Rural District Council had given its consent. It was pointed out that the cost of an overhead line was £1,700 per mile, compared with £3,200 for underground mains.

Irish Free State.—THE SHANNON SCHEME.—The Free State Government hopes to have the Shannon hydro-electric scheme completed in 1929. The estimates for the current year show that the cost of the scheme, as originally calculated, will be £5,250,000, and that, with the new advance in the 1926-7 figures, £2,282,200 will have been provided, leaving nearly £3,000,000 to be found in 1927-8.

Japan.—ELECTRICAL DEVELOPMENT.—The I.G.R. is erecting a large steam power station near Teurumi, at a cost of 17,000,000 yen, and it will be completed by the fiscal year 1928-1929. The plant will include three 20,000-kW turbo-generators.

KOBE.—The city of Kobé has a plan to extend its electrical plant at a cost of more than ten million yen. The fund will be raised by loans issued subject to the authorisation of the Tokio Government. The plant will include a 35,000-kW set.

London.—ST. PANCRAS.—The Electricity Committee has had under consideration the revision of the charges under its scheme for electricity supply to small dwellings, and has recommended to the Borough Council that the fixed weekly charge be withdrawn and meters installed, electricity being charged at 7d. per kWh for a minimum consumption, according to the number of points per house, after which the present flat rate for lighting would apply.

ISLINGTON.—The Electricity Committee has voted capital expenditure as follows:—Cables, £9,000; services, £6,000; transformers, £3,500; meters, £3,000.

Loughborough.—ELECTRICITY EXTENSION.—The electrical engineer has recommended to the Electricity Committee that the cables be extended to the Outwoods Drive district and a sub-station erected at an estimated cost of £3,450.

Motherwell.—ELECTRICITY SUPPLY.—The Electricity Committee has accepted the offer of the Motherwell Machinery and Scrap Co., Ltd., to purchase and remove plant at the electricity works for £4,180. The Electricity Commissioners have written the Town Council requesting further information regarding the Council's application for consent to borrow £32,608 for a bulk supply.

Newcastle-on-Tyne.—PROPOSED CHANGE-OVER.—The Newcastle and District Electric Lighting Co., Ltd., has applied to the Corporation Transport and Electricity Committee for approval to change its system of supply to consumers in the city who are now being supplied from its single-phase, 80-cycle system at 100 and 240 V, and to substitute either its a.c. 250-V and 480-V, 3-phase, 40-cycle supply or d.c. at 240-V and 480-V. The Committee has recommended to the Town Council that the change-over be approved.

Northern Ireland.—LURGAN (Co. ARMAGH).—The Urban District Council is applying to the Electricity Commissioners of Northern Ireland for sanction to a loan of £11,350 in connection with its electricity scheme.

Nuneaton.—SCHEME APPROVED.—The Rural District Council has given approval to the proposals of the Leicestershire and Warwickshire Electric Power Co. to erect overhead cables between Long Lawford and the power station at Hinckley, passing through the parishes of Wolvey and Burton Hastings.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

SLEAFORD.—Lighting, heating, and power: A reduction of 1d. per kWh.

BOURNEMOUTH.—*Bournemouth and Poole Electricity Supply Co., Ltd.*—Lighting: First 5,000 kWh, per annum, 7d. per kWh; next 15,000 kWh, 6d.; beyond, 3½d. per kWh. Power: Varying from 3d. for the first 2,000 kWh per quarter to 1¾d. for over 10,000 kWh. Heating and cooking: First 5,000 kWh per quarter, 2d. per kWh; beyond, 1¾d. per kWh.

BLACKPOOL.—Heating: From 1½d. to 1¼d. per kWh; "all in" tariff, secondary charge, from 1d. to ¾d. per kWh; and an industrial heating tariff of 1¼d. during peak load hours and ¾d. off peak load hours, subject to a minimum consumption of 2,000 kWh per quarter, with a meter rental of 10s. per quarter for two-rate meters.

SALFORD.—Power (within the borough): Varying from 2½d. per kWh for the first 250 kWh per quarter, to .8d. per kWh for all energy in excess of 25,000 kWh, with an alternative charge on the maximum demand system. Power (in the urban district of Prestwich): Varying from 2¾d. per kWh for the first 250 kWh per quarter to .9d. for all energy consumed in excess of 25,000 kWh.

SOUTH SHIELDS.—Power, heating, and traction: From 1½d. to 1¾d. per kWh.

CARMARTHEN.—*Carmarthen Electric Supply Co., Ltd.*—Lighting: 8d. per kWh. Heating and cooking: Summer quarters, first 100 kWh, 2d. per kWh; above this amount, 1½d. per kWh; winter quarters, first 100 kWh, 2½d. per kWh; above 100 kWh, 2d. Power: Sliding scale, from 4d. to 1¾d. per kWh.

HAMILTON.—Lighting: From 8d. to 6½d. per kWh. Heating: From 2d. to 1¾d. per kWh, with reductions for public lighting and power.

RATHMINES AND RATHGAR (Co. DUBLIN).—Lighting: 6d. per kWh. Outside lighting: 4d. per kWh. Heating, cooking, and other domestic purposes: 2d. per kWh. Lighting (through slot meter, including meter rent): 7d. per kWh. Power: Unrestricted supply, 2d. per kWh; restricted hour supply, 1¾d. per kWh.

PEMBROKE (DUBLIN).—Lighting: From 6d. to 5½d. per kWh. Heating and cooking: From 2½d. to 1½d. per kWh.

SALE.—Maximum demand system: 7d. per kWh up to 100 hours' use per quarter and 2d. per kWh beyond. Domestic heating: First 100 kWh per quarter, 2d. per kWh; next 100 kWh, 1¾d.; beyond, 1½d. Private house domestic rate: A fixed charge of 20 per cent., of the rateable value, plus 1½d. per kWh during the summer quarters, and ¾d. per kWh during the winter quarters.

Rothesay.—NEW POWER STATION.—Application has been made for consent to the establishment of a generating station at a cost of £10,200. Meanwhile the town is taking a supply of energy in bulk from the Rothesay Tramways Co., Ltd.

Sandwich.—ELECTRICITY SUPPLY.—The Town Council has appointed a committee to approach Messrs. Pearson and Dorman Long, Ltd., with a view to obtaining a supply of electricity for the borough.

Sheffield.—LOANS SANCTIONED.—The Corporation has received sanction to the borrowing of £300,000 for mains and £60,000 for equipment of sub-stations on consumers' premises.

Shrewsbury.—Loan Sanctioned.—The Electricity Committee has received sanction to the borrowing of £8,000 for plant.

Special Orders.—Applications have been made to the Electricity Commissioners for Special Orders by the following authorities:—The National Electric Construction Co., Ltd., for the supply of electricity in the urban district of Holbeach; the Derbyshire and Nottinghamshire Electric Power Co., to supply in the urban districts of Bakewell, Baslow and Bubnell, and South Darley, and the rural district of Bakewell; and the Truro Electricity Supply Co., Ltd., in the city of Truro.

Stourport.—New Power Station.—The new power station erected by the Shropshire, Worcestershire, and Staffordshire Electric Power Co. will, it is expected, be inaugurated in May by the Prime Minister. The plant may ultimately reach 200,000 h.p., and the area to be supplied will include the northern and central parts of Worcestershire and parts of Staffordshire and Shropshire. There will be sub-stations at Kidderminster, Halesowen, and Redditch, and a linking-up with the system in Smethwick, Dudley, and Oldbury.

Thornton-de-Fylde. — Loan Sanctioned. — Sanction has been received by the Urban District Council to the borrowing of £29,750 in connection with the electricity scheme for the district.

Torquay.—Loans Sanctioned.—The Town Council has received sanction to a loan of £10,000 for mains and services.

Extension of Supply.—Application has been made for a Special Order to extend the present area of supply so as to include a number of additional parishes. The total estimated capital cost of the extension is £21,800.

Wirral.—Electricity Scheme.—The Rural District Council, acting upon the advice of the Electricity Commissioners, has decided to negotiate with the Corporations of Birkenhead and Wallasey, and the Mersey Power Co., Ellesmere Port, with a view to obtaining bulk supplies of electricity, to carry into effect the Council's electricity scheme for which it obtained a draft Order in August, 1925. The Commissioners, following a recent inquiry into an application for sanction to borrow £110,000 to carry out the first part of the Wirral Council's scheme, expressed the view that a modified scheme should be brought forward.

Worcester.—Loan.—The Electricity Committee has recommended the City Council to apply for sanction to borrow £30,000 for the following purposes:—Mains, £15,000; services, £6,500; and sub-station equipment, £7,500.

Tramway and Railway Notes.

Canada.—New Electric Railway.—The Ontario Hydro-Electric Commission is conferring with the municipalities concerned in connection with a proposal to construct a high-speed radial railway from Toronto to Hamilton at a cost of $11,000,000.

Continental.—Germany.—It is reported that the German State Railway authorities have decided to establish a new power station near Berlin to supply electricity for the Berlin Metropolitan Railway. A feature of the new plant which is to be located near the Berlin municipal power station at Rummelsberg, is that the boilers will be adapted to use as fuel lignite drawn from the mines near Frankfürt-am-Oder, about 62 miles away.

The Baden State Railway Council is urging the German State Railway authorities to take in hand without further delay the electrification of the railway between Frankfürt-am-Main and Basle.

East Ham.—Track Renewals.—The Tramways Committee has decided to reconstruct the tramway track in Rowland Road West at an estimated cost of £15,500.

London.—A New Ticket Machine.—A new type of ticket-issuing machine is shortly to appear on the Underground Railways, which will fully print, number, and date the ticket at the time of issue at the rate of five per second.

Trafalgar Square Tube Improvements.—The new escalators at Trafalgar Square Station (Bakerloo) were put into service on April 13th. The new escalators are of comb type. The area now occupied by the lifts will be devoted to a new and more spacious booking hall. The station, now catering for four million passengers a year, will be able to handle eight millions with ease. A new subway, giving a connection between the Underground station and Cockspur Street, is to be constructed. This will be completed by about midsummer.

Royton.—Scheme Rejected.—In connection with a request from the Oldham Corporation for the consent of the Urban District Council to the reconstruction of the tramway track in Oldham Road between the boundary at Longsight and Royton Town Hall, the Council has decided that it cannot reconsider its decision not to proceed with the proposed work.

Worcester.—Purchase of Undertaking.—At a recent meeting of the City Council it was decided to purchase the tramway undertaking for £58,000. The necessary Bill will come before the House of Lords on April 27th.

Telegraph and Telephone Notes.

Argentina. — Telephone Repeaters. — An amplification station is about to be erected by the Argentine Telephone Co. in Buenos Aires to link up subscribers in the towns of Bahía Blanca and Córdoba, a total distance of 1,952 kilometres. Santa Fe, Villa María and Rio Cuarto will also be brought within the radius.—*Reuter's Trade Service* (Buenos Aires).

Guernsey.—Inter-Island Telephony.—In response to a petition from the tradespeople of Guernsey and Alderney to the State Telephone Council, experiments in telephony between the two islands have been successfully carried out. It has been found possible to use the single telegraph wire which already unites the two islands for carrying on a telephone conversation, and at the same time to send a telegraph message, which will obviate the necessity of laying a new cable.

South Africa.—Long-distance Telephony.—Direct telephone communication was inaugurated on April 12th between Johannesburg and Cape Town, a distance of 908 miles, five repeaters being used.

The Telephone Service.—Suggested Separation.—At its annual meeting this week the London Chamber of Commerce is to urge the Government to appoint at an early date a Commission for the purpose of introducing a new system of Post Office Administration, including the separation of the postal service from the telegraph and telephone services and possibly the vesting of the latter services in a semi-independent body, which should include non-official representation.

Continental Service.—All-day telephone communication between England and Germany will be established when the last portion of the cable connecting Domburg (Holland) with Aldeburgh (England) has been linked with the German telephone system. The German steamer *Neptune* went to Holland from Cologne last week to carry out this work, which is expected to be completed by the end of April. The cable is 165 kilometres long and weighs 1,700 tons.—*Reuter* (Berlin).

New Exchanges.—To meet the immediate requirements of the "Hop" district a new 800-line exchange was opened on April 19th and will be known as "Waterloo." During the summer two others, to be called "Rodney" and "Reliance," will be opened to serve the Walworth and Oval areas respectively; they will have a capacity of 3,500 lines each. A new Bermondsey exchange is also in hand.

Police Telephone Boxes.—It is estimated that £13,000 a year will be saved to the rates of Newcastle by the decision of the Watch Committee to introduce the police telephone box system. The nine police stations at present in use will be reduced to three, and in the place of the six stations to be closed, fifty-one telephone boxes will be erected.

Northern Trunk Extension.—The trunk telephone extension from Inverness and Tain, northwards to Wick and Thurso, was formally opened last week. The extension covers a distance of 118 miles, and Mr. John McAllan, chief inspector of telegraphs, Inverness, was responsible for the carrying out of the work.

The Yap Cable.—Dutch Assignment.—According to German reports, the Allied Governments contemplate the assignment of the Yap-Menado cable, which belonged to the German-Netherlands Telegraph Co. and was seized during the time of the war, to the Dutch Government. When the negotiations on the matter have been concluded it will be possible for the financial situation of the Company to be cleared up in connection with the claims made by the Company on the German Government for compensation.

Radio Notes.

Licences.—Prosecutions.—It was announced on April 16th that proceedings had been taken in 135 cases against people for installing broadcast radio receiving sets without licences, and that 134 convictions had been secured.

Korea.—Broadcasting Service.—The Seoul Radio Broadcasting Station Establishment Committee hopes to open a station in July and establish a service with a capital of y. 200,000; 48 of the promoters of the scheme are in Seoul and 51 in the provinces. Monthly reception charges are estimated at y. 2, the number of possible subscribers being expected to reach 5,000. The undertaking is to be a corporate juridical body, and *Eastern Engineering* expects the projected station to be powerful enough to serve the whole of Korea. Broadcasting will be in both Korean and Japanese.

United States.—"Radio Slander."—The first conviction in America for "slander" by wireless has been recorded. *The Times* explains that recently a wireless news "bulletin" was broadcast from Chicago's "Moulin Rouge" cabaret, which contained a statement regarding the State Attorney, Mr. Crowe. The Attorney issued a writ for libel, but this was later reduced to a slander charge, and the proprietor of the establishment has been ordered by the courts to pay a fine of £5 and costs for "disorderly conduct."

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—June 16th. City Council. Turbo-alternator, exciter, and condensing plant.*

Adwick-le-Street.—May 19th. Urban District Council. H.p. switchgear and cables, step-down transformers, l.p. distribution gear, pillars, cables, joint boxes, &c. (April 16th.)

Barking.—May 10th. County of London Electric Supply Co., Ltd. Coal-unloading, storing, and reclaiming plant. (April 9th.)
May 11th. Switchgear and accessories, transformers, and piping equipment. (March 26th.)

Chile.—SANTIAGO.—August 20th. Chilean State Railways. Signals, telegraphs and telephones, electrical material for sub-stations, aerial lines, and lighting.*

Croydon.—April 28th. Electricity Department. Water-softening plant. (See this issue.)

Doncaster.—May 4th. Electricity Department. One 1,000-kW motor converter and l.p. switchgear. (See this issue.)

Dublin.—May 4th. Electricity and Public Lighting Department. E.h.p. and l.p. cables, cast-iron pillars, and stoneware troughing, section pillars, compound and other materials and accessories for one or two years. (See this issue.)

Dundee.—Education Authority. Installation of electric lighting at four schools. Specifications, &c., from Mr. John E. Williams, executive officer.

Edinburgh.—April 26th. Electricity Supply Committee. Installation of electric lighting and wiring for motors at the public wash-house, Portobello. Specifications from the Engineer's office, Dewar Place.

Exeter.—May 11th. Electricity Department. Boiler-house plant complete:—Two water-tube boilers with economisers, pumps, coal bunkers, conveyor, and accessories. Self-supporting steel chimney, induced-draught fan, and accessories. (April 9th.)

Glasgow.—May 6th. Electricity Department. L.p. cables, small i.r. insulated cables and flexibles, meters and carbons for 12 months. (See this issue.)

Grimsby.—April 26th. Electricity Department. E.h.p. cell-type switchgear. (April 16th.)

Halifax.—Wiring for about 70 points in house. Electricians desirous of tendering to send names to Henry Thompson, architect, Elland.

Harrogate.—April 25th. Electricity Department. H.p. and l.p. switchgear for sub-stations. (April 9th.)

India.—April 30th. India Store Department. 22,000-V cables. (April 2nd.)
April 30th. Alkaline train-lighting cells. (April 16th.)
May 7th. 15 motor-coach underframes and bodies, 30 motor bogie trucks. (March 12th.)
May 11th. One 200-kW La Cour-type motor converter. (See this issue.)
May 14th. Three 5-kW oil engine-driven generator sets, one switchboard, and two pumping sets.*
May 15th. Madras and Southern Mahratta Railway Co., Ltd. Telephone line material (comprising porcelain insulators, galvanised terminal irons, &c.), copper line wire (1,302 miles), copper binders, tapes, &c. (See this issue.)

London.—LONDON COUNTY COUNCIL.—May 4th. Electric wiring and fittings at the Alton Street elementary school, Poplar, E. (April 16th.)
H.M. OFFICE OF WORKS.—April 28th. Fuse boards and switches. (April 16th.)
May 7th. Steel conduits and fittings for electric wiring. (See this issue.)
ST. MARYLEBONE.—May 5th. Electricity Department. L.p. and e.h.p. underground cables for 12 months. (See this issue.)

Manchester.—May 11th. Tramways Committee. Electric tramcar bodies, trucks, motors, and controllers. Specifications from Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.
April 30th. Central Purchasing Committee. Twelve months' supply of incandescent lamps. Forms of tender from Mr. H. C. Lamb, manager, Electricity Department, Manchester.

Meltham.—April 27th. Electricians' work at extension of Liberal Club. Quantities from Stocks, Sykes & Hickson, architects, 4, St. Peter's Street, Huddersfield.

New Zealand.—June 21st. Auckland Electric Power Board. L.p. insulators, &c.*
WELLINGTON.—May 12th. Post and Telegraph Department. 18 switchboards.*
DUNEDIN.—May 28th. Otago Harbour Board. One portable electrically-driven cargo stacker.*

Nottingham.—May 31st. Board of Guardians. One 60-kW d.c. turbo-generator, &c., and alterations to main switchboard, &c. (April 16th.)

Seaham Harbour.—May 5th.—Urban District Council. Overhead l.p. pole line, h.p. cables, sub-station equipment, h.p. switchgear. Specifications (£2 2s.) from Mr. J. E. Favell, consulting engineer, 22, Oxford Street, Newcastle-on-Tyne.

South Africa.—JOHANNESBURG.—Municipal Council. 8 miles h.p. cable, 41 miles l.p. cable.*

Southern Rhodesia.—June 21st. Department of Posts and Telegraphs. Automatic telegraphs. Automatic telephone exchange for Salisbury. (See this issue.)

Spain.—MADRID.—May 9th. Compania de los Caminos de Hierro del Norte. Overhead line, converting sub-stations, locomotives and motor coaches for the electrification of the lines from Barcelona to Manresa and San Juan de las Abadesas in one contract. The constructors are to obtain as much as possible of their supplies from Spanish industries.

Switzerland.—Tenders have been invited for the erection of the overhead lines necessary for the electrification of the railway between Brugg and Pratteln.

Turkey.—May 15th. Direction Générale des Postes et Télégraphes. 111,000 metres of 3, 7, 10 and 12 pair aerial telephone cable; 10,000 metres of 3, 7, 10 and 12 pair underground cable with joint boxes and accessories.*

Walthamstow.—May 12th. Electricity Department. One 1,500-kW motor converter. (See this issue.)

Warrington.—April 26th. Electricity and Tramways Committee. L.p. paper and lead-covered cables. (April 9th.)
May 10th. Electricity Department. E.h.p. sub-station truck-type switchgear. (See this issue.)

Waterford.—May 12th. Electricity Department. Two 250-kVA, 3-phase alternators direct coupled to heavy oil engines, e.h.p. mains and l.p. underground distribution system, transformer kiosks, pillars, street lighting services, l.p. overhead distribution system, &c. (April 9th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Barnes.—Lighting Committee. Accepted:—
Feeder pillars.—W. Lucy & Co., Ltd.

Bath.—Town Council. Accepted:—
7,000-kW Brush-Ljungström turbo-alternator, complete with condensing plant and accessories (£23,020).—Brush Electrical Engineering Co., Ltd.

Bradford.—Tramways Committee. Accepted:—
24 tramcar gear wheels (£164).—Alfred Wiseman, Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—
Switchgear for Park Street sub-station (£599).—Ferguson, Pailin & Co., Ltd.

Carlisle.—Electricity Committee. Accepted:—
Overhead line to Cocklakes (schedule prices).—British Insulated Cables, Ltd.

Croydon.—Electricity Committee. Recommended:—
Steam receiver and pipe work in connection with erection of alternator set (£1,365).—Babcock & Wilcox, Ltd.

Dublin. — City Administrative Commissioners. Accepted:—
Wiring 230 houses in connection with the Croydon Park housing scheme (£2,714), and 218 houses at Kehoe Square (£2,601).—Dublin City Electricity Department.

East Ham.—Electricity Committee. Recommended:—
Cable (£6,147).—Bergmann Electric Co., Ltd.
Conduit tiles (£11 9s. 6d. per 1,000).—J. Baldwin.
Three switchboard panels (£210).—Bertram Thomas.
Two feeder pillars (£117).—W. T. Henley's Telegraph Works Co., Ltd.
High-pressure cylinder (£1,230).—Murgrave & Co., Ltd.

The Council has since decided to refer to the Government the question of the contract for the supply of a new feeder cable for Manor Park. The lowest tender was that of the Bergmann Electric Co., Ltd., at £6,147, but there was considerable opposition to the acceptance of a tender from a Continental firm.

Grange-over-Sands (Lancashire).—District Council. Accepted:—
Underground electric cables and connections for the new electricity area (£2,740).—Johnson & Phillips, Ltd.

Gravesend.—Electricity Committee. Recommended:—
Steam pipes (£218 15s.).—Foster Bros.

Heywood.—Electricity and Tramways Committee. Accepted:—
Overhauling the e.h.p. overhead line between the electricity works and Bury.—British Insulated Cables, Ltd.

Leyton.—Education Committee. Accepted:—
Installing electric light at Sybourn Street Infant School (£205).—Burdette and Co.

London. — ISLINGTON. — Cleansing Committee. Recommended:—
Two 3¼-ton electric vehicles (£1,892).—Electricars, Ltd.

Lamp Contracts.—Metro-Vick Supplies, Ltd., has received contracts from the London, Midland & Scottish Railway Co. for "Cosmos" vacuum train lamps, and from the Admiralty for "Cosmos" gasfilled ordinary lamps for H.M. ships.

Lynn.—According to the *Daily Telegraph*, the Town Council last week accepted a German tender for six miles of electrical cable, the price being £2,480, which was nearly £900 less than the lowest British tender.

Maxwelltown.—Town Council. Accepted:—
Wiring houses at Troqueerholm for electric light (A type, £47 10s.; B type, £25 16s.; C type, £25 10s.; D type, £25 10s.).—Mr. Moodycliffe.

New Zealand.—AUCKLAND.—Auckland Power Board. Accepted:—
Cable (£17,000 approx.).—Concordia Electric Wire Co., Ltd.

Oldham.—Electricity Committee. Accepted:—
Ventilating frames and covers.—John Hall (Oldham), Ltd.
Cable.—Union Cable Co., Ltd.
Switchgear.—Ferguson, Pailin, Ltd.

Perth.—Corporation. Accepted:—
Electric lighting installation at Corporation housing schemes at Pitheavlis.—W. Borthwick.

Portsmouth.—Electricity Committee. Recommended:—
Two test panels (£376).—Johnson & Phillips, Ltd.
1,500-kVA transformer (£890), three transformers (£267).—Hackbridge Electric Construction Co., Ltd.

Ramsgate.—Town Council. Accepted:—
Installing electric light at the Westcliff Concert Hall (£216).—E. A. Pinto.

Rotherham.—Corporation.
Straker-Clough omnibus chassis.—Clough, Smith & Co., Ltd.

Sheffield.—Tramways Committee. Recommended:—
500 steel tramcar tires (£2,644).—John Brown & Co., Ltd.

Stirlingshire.—Education Committee. Accepted:—
Installing electric lighting at new schools at Riverside, Stirling.—Lockhart & M'Nab.

Stoke-on-Trent.—Electricity Committee. Accepted:—
Dismantling interior of cooling tanks at central power house (£542).—Davenport Engineering Co., Ltd.
L.p. d.c. feeder panel at Burslem sub-works (£137).—Park Royal Engineering Co., Ltd.

Wakefield.—Housing Committee. Accepted:—
Wiring 50 houses on the Lupset estate.—Mr. H. Smith.

Forthcoming Events.

Birmingham Electric Club.—Friday, April 23rd. At the Grand Hotel, Colmore Row. At 7 p.m. Discussion of the I.E.E. Wiring Rules, to be opened by Mr. C. G. McDonald and Mr. H. Joseph.

Junior Institution of Engineers.—Tuesday, April 27th. At the Monico Restaurant, Piccadilly Circus, W. At 6.30 for 7 p.m. Annual dinner.

Institution of Electrical Engineers.—Thursday, April 29th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "The Frequency Characteristics of Telephone Systems and Audio-Frequency Apparatus and their Measurement," by Messrs. B S. Cohen, A. J. Aldridge, and W. West.

(North-Eastern Centre).—Monday, April 26th. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Annual general meeting. Lecture on "Modern Methods of Measurement," by Mr. B. A. Robinson.

(Scottish Centre and Dundee Sub-Centre).—Friday, April 30th. At the Y.M.C.A. Hall, Constitution Road, Dundee. At 7.30. p.m. Lecture on "The Past, Present, and Future of Wireless Telephony," by Capt. P. P. Eckersley.
Saturday, May 1st. Excursion to St. Andrews.

(South-Midland Centre).—Monday, April 26th. At the University, Birmingham. At 7 p.m. Ordinary meeting.

(London Students' Section).—Wednesday, April 28th. At the E.L.M.A. Lighting Bureau, 15, Savoy Street, W.C. At 7 p.m. Lecture and demonstration on "The Art of Illumination."

Illuminating Engineering Society.—Thursday, April 29th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7 p.m. Discussion on "School Lighting (Modern Requirements and Recent Progress)," to be opened by Dr. J. Kerr.

Royal Institution.—Thursday, April 29th. At 21, Albemarle Street, W. At 5.15 p.m. Lecture on "The Imperfect Crystallisation of Common Things." by Sir W. Bragg.
Friday, April 30th. At 9 p.m. Lecture on "Wireless in the Empire," by Dr. W. H. Eccles.

Notes.

Local Societies.—Under the auspices of the Hastings and St. Leonards Radio Society, Mr. Wilfrid Schofield, of the Hart Accumulator Co., Ltd., delivered to an appreciative audience at Hastings on April 12th a lecture on "The Theory and Practice of Electric Accumulators."

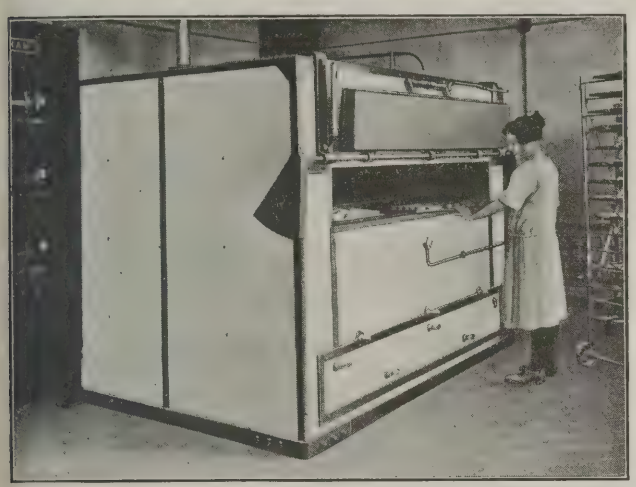
NOTTINGHAM SOCIETY OF ENGINEERS.—A joint meeting with the Nottingham section of the Society of Chemical Industry was to be held on Wednesday last at the University College, when a paper on "Stream-line Filtration" was to be given by Professor J. W. Hinchley, A.R.C.S., F.I.C., accompanied by a demonstration of the stream-line filter.

A Large Hydro-Electric Project.—In a recent issue of *Power* some details are given of a scheme which has been submitted to the Chicago Chapter of the Izaak Walton League of America by Mr. C. Campbell, as a solution to the problem of maintaining and increasing the present low levels of the Great Lakes. The plan provides a new supply of water from the north into Lake Superior by diverting the waters of the watershed of the Albany River and its main tributary, the Ogoki, by the construction of two great dams, one on each side of the two rivers, and bringing these stored waters southward, through a canal cut through the high land on the southern side of this watershed, to flow from there south into Lake Nipigon and on through Nipigon River into Lake Superior. Mr. Campbell also suggests, as an after consideration, the creation of a new Great Lake, 15,000 sq. miles in area, should a great storage reservoir become desirable. The estimated cost of the scheme is $150,000,000, and the additional power which would be rendered available along the Great Lakes and the St. Lawrence River is estimated to be 1,000,000 h.p. A committee has been appointed to consider the merits of the schemes.

Iron Bauxite Smelting in Norway.—It is announced from Oslo that a large new works is to be established at Kinsarvik in Hardanger for the production of iron direct from the ore and the incidental output of alumina according to the process devised by Professor Pedersen, which is claimed to have been fully worked out. The scheme is being promoted by the A.S. Kinsarvik, in which the Aluminium Company of America has acquired or has applied to acquire the bulk of the capital. The process consists in the smelting of iron ore, but instead of limestone bauxite is used as a flux. The result is said to be the production of fine pure iron, equal to the best Swedish malleable iron, and of the semi-product alumina, which can be subsequently smelted in the electric furnace into aluminium. It is estimated that from 800 to 1,000 men will be permanently employed at the works and that from 500,000 to 600,000 tons of iron ore and bauxite will be required per annum.

Tramway and Light Railway Return.—A return has been issued by the Ministry of Transport of the accounts and statistical returns of the tramway and light-railway undertakings in Great Britain for the year ended December 31st, 1924, in the case of companies, and March 31st, 1925, for local authorities. It has been prepared and revised in accordance with the recommendations of a committee consisting of representatives of the Institute of Municipal Treasurers and Accountants, the Municipal Tramways Association, the Tramways and Light Railways Association, the Ministry of Health and the Ministry of Transport. The total route mileage open for traffic at the end of the period was 2,605 miles, of which 1,859 miles was worked by local authorities and 746 miles by companies. The total capital expenditure up to the same date amounted to £94,552,372. The total gross receipts for 1924-25 were £28,737,639, and the total working expenditure £22,733,155, leaving net receipts amounting to £6,004,484. The number of passenger journeys made during the year was 4,620,501,521, an increase of approximately 177 million over 1923-24. The car-miles run amounted to 378,239,229, of which 99.59 per cent. were by electric cars. The return, which is obtainable from H.M. Stationery Office, price 15s., also gives particulars of the trackless-trolley undertakings in Great Britain.

Telephotography.—Capt. R. H. Ranger, of the Radio Corporation of America, has brought a complete set of telephotography, or "photo-radio," apparatus to this country, and hopes, in co-operation with Marconi's Wireless Telegraphy Co., Ltd., to demonstrate during his visit to London the practicability of inaugurating a commercial service on his system. The route would be by land line to the Carnarvon radio station, thence across the Atlantic ocean to River Head, Long Island, and so by an 80-mile land line to New York. Three transmitters and two receivers are in use at New York City, and regular tests are being made with San Francisco; a limited service has also been opened between San Francisco and Honolulu. It is claimed that the detail in such pictures is comparable with that on an 80-line screen.



Telephone Battery-charging Set.—The Post Office Telephone Department has just taken delivery of a generating set, made by Messrs. Stuart Turner, Ltd., for battery-charging, which has an output of 1,200 watts. The telephone service does not require many sets of plant of as large a capacity as this, as a supply of electricity is generally available from the public mains. The plant is of the standard FS type made by the firm for country-house lighting, but the dynamo has been made capable of the special output necessary for telephone batteries.

Stage Lighting at the Plaza Theatre.—The electrical installation at London's latest kinema theatre, the Plaza, includes a bank of G.E.C. Schwabe horizon flood lamps, cloud apparatus, and panorama projectors for use in conjunction with an artificial horizon or cyclorama. This is probably the first installation of apparatus of this nature incorporating stage lighting in the general scheme which has been made in a kinema in the United Kingdom, and is of interest as a new departure in kinema equipment. Three G.E.C. magazine battens fitted with 150-watt "Osram" gasfilled lamps, wired on four-colour circuits, are also installed; these battens are of an entirely fresh design, and embody a new type of highly-efficient metallic reflector, rustless and non-tarnishing.

Explosive Reactions in Gaseous Media.—A general discussion on this subject is being organised by the Faraday Society, to take place on Thursday, May 13th, at the Institution of Mechanical Engineers, Westminster. The proceedings will be divided into two sessions. The first, from 2.30 to 6.30 p.m., will deal with the subject generally, and Professor H. B. Dixon, F.R.S., will preside. An introductory survey will be given by Dr. W. E. Garner, and papers initiating discussion will be presented by Professor Dixon, Professor W. T. David, Dr. S. W. Saunders, Dr. R. V. Wheeler, Professor W. A. Bone, and Dr. C. Campbell. The second session, 7.45 to 10 p.m., will deal with "Explosive Reactions Considered in Reference to Internal Combustion Engines." Sir Dugald Clerk, F.R.S., will preside and he will give an introductory survey, being followed by Professor David and Mr. H. T. Tizard. A dinner will be held between the sessions at the St. Ermin's Hotel. A full programme can be obtained on application to Mr. F. S. Spiers, 90, Great Russell Street, London, W.C.1.

Meter Engineers' Technical Association. — The first general meeting of the Association was held on April 15th at Anderton's Hotel, Fleet Street, London, E.C.4, when 37 members and visitors met to receive the Council's report on the progress made to date and to discuss proposed future activities. It was decided to hold the general meetings monthly during the winter months.

The Conveyor-type Electric Oven.—The use of the conveyor principle for electric ovens is proving of great assistance to progress towards the general adoption of electricity for baking. The outstanding advantages of this construction are greater convenience of operation and absolute uniformity of baking. Cumbersome drawplates and unwieldy peels are entirely dispensed with, since the oven brings its shelves right to the oven door for loading and unloading. Labour costs are thereby reduced and a valuable saving of space in front of the oven is effected. A one-sack conveyor oven, it is claimed, can easily be operated by a young girl. The accompanying illustration shows an oven of this type in operation in a bakery of Messrs. H. Cookson & Sons, Preston, manufactured by the

An Electric Bakery Oven at Preston.

Metropolitan-Vickers Electrical Co. The conveyor oven is equally suitable for the mass production of one class of goods and for the mixed trade of the ordinary baker and confectioner. Provided that whatever goods are to be baked require the same temperature, they can be baked together and each portion removed when it is ready. It is interesting to note that ovens of this type have recently been installed for such well-known firms as Cadbury Brothers, the Indo-China Tea Company ("Kardomah" Cafés), and the Welwyn Garden City Bakery. Probably the deciding factor in connection with electric ovens is the question of the cost of operation and on this point there appears to be a good deal of misapprehension. The experience of those who have adopted electrical baking is that with electricity at 1d. per kWh, the cost is about 3d. per £1 worth of goods baked or 1¼ per cent. of the goods value.

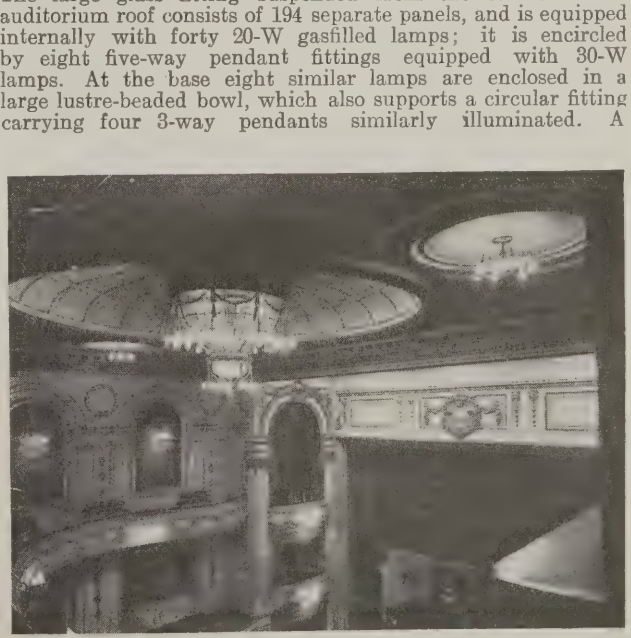
Radium in Czecho-Slovakia.—During 1925, one and a half grammes of radium were produced at the Jáchymov mines, which raises the quantity of radium extracted since 1902 to about 12 grammes. A quantity (1.6 grammes) was lent some years ago to a British company, but this company having "disappeared," the radium was deposited at the Czecho-Slovak Legation in London. The rest, apart from quantities sold or placed at the disposal of clinics against an interest of 10 per cent. payable to the Ministry of Public Instruction, is deposited with the Office Bancaire against an interest of 10 per cent. The interest represents an important part of the revenue of the Jáchymov State mines. In 1922 the international price of radium was 10,000,000 crowns; now it is 3,000,000 crowns. The Jáchymov mines employ a staff of 300 workers, out of which thirty are miners; apart from the extraction of pitchblende and the production of radium, they are also engaged in the extraction of uranium compounds from which dyes are obtained for use in the glass and porcelain industries; the dyes are exported principally to Germany and Great Britain.—*Reuter's Trade Service* (Prague).

Electrically-operated Swing Bridges.—The Great Western Railway is installing electric power for the operation of the swing bridge over the River Neath at Court Sart on the Rhondda-Swansea Bay Railway, to take the place of the existing hydraulic machinery.

The Sarsfield swing bridge, spanning the Shannon at Limerick, which was erected some two years ago by the Limerick Harbour Board, has recently been equipped for electrical operation by the Metropolitan-Vickers Electrical Co., Ltd. The bridge was formerly operated by manual labour.

American Electric Lamp Developments.—An estimate of the incandescent electric lamp business in the United States for 1925 indicates the sale of 280,000,000 lamps for home, office and factory lighting, representing an increase of 7¼ per cent. on the sales of the previous year. About 195,000,000 "Miniature" flashlight lamps were also sold during that period, a 3½ per cent. increase. A practical method of chemically frosting the inside surface of electric lamp bulbs is said to have been developed, which, it is claimed, results in a reduction of the absorption of light to less than 2 per cent. The production of the double-filament Mazda headlight lamp, with two 21-c.p. filaments, was the foremost achievement in the small lamp field. One filament, it is stated, throws a powerful beam far down the road and the other filament gives a beam depressed about 2½ degrees.

Notable Performance of a Starter Battery.—Miss Violette Cordery's Invicta motor-car, on which she recently set up four new world's records and four international class records on the Monza track, Milan, is fitted with Exide batteries. The average speed maintained for 15,000 miles was no less than 56 m.p.h.



According to the rules governing these records, if for any reason the car stops on any part of the track, the driver may not have any assistance in bringing it round to the replenishing depôt. Consequently, as it is not too easy for one person to push the car for perhaps two miles, the Invicta Co. decided, before making the above record-breaking attempt, to discover how far the starter battery would drive the car on top gear with the engine switched off and against compression—admittedly a rather brutal test. The Invicta Co. reports the result of this test as follows:—"A standard Invicta car was taken at random, and on a level road the engine was stopped and the car driven solely by the Exide starter batteries for one mile at a speed of about 3 m.p.h. At the end of a mile the voltmeter still showed over 12 volts, and it was estimated that the car could have been driven about two miles in all. The following morning the same Exide batteries, with no recharging, started the engine at once from cold.

Scientific Organisation in Belgium.—Following the International Congress on Scientific Organisation held in Brussels in September last, a movement has been started in that city to organise a Belgian National Committee of Scientific Organisation.

All-Electric Public Baths.—On April 17th, the new all-electric public baths at North Woolwich were officially opened by the Mayor of Woolwich, Councillor W. Baresoot, J.P. The water is heated on the Bastian electric water-heating system, the apparatus being supplied by Messrs. Bastian & Allen.

Electrically-Welded Railway Apparatus.—Some interesting particulars are given in the *Railway Review* of a locomotive tender tank which, with the exception of the safety appliances (grab handles) has been constructed throughout by arc welding. The tank was put into service in 1921 and since that time it has covered a distance of 201,563 miles and no defects have developed in the welding. The tank is made of ¼-in. plate and is 26 ft. long, 10 ft. wide and 5 ft. 2 in. high. It has a capacity for 8,000 gallons of water and 12 tons of coal. In the average tank of this capacity there are approximately 7,000 rivets of a total weight of 800 lb., and the number of holes punched in sheets, angles and T-braces would total approximately 15,800. A total of 39½ lb. of welding rod was used in the new tank. In order to eliminate the water scoring and rusting prevalent in the riveted type of tank, the welding of the T-braces to the bottom and top of the tank was continuous in its entire width.

A Theatre Lighting Installation.—The accompanying illustration shows the effects of the lighting installation with which the Aldwych Theatre, London, has been equipped. The large glass fitting suspended from the centre of the auditorium roof consists of 194 separate panels, and is equipped internally with forty 20-W gasfilled lamps; it is encircled by eight five-way pendant fittings equipped with 30-W lamps. At the base eight similar lamps are enclosed in a large lustre-beaded bowl, which also supports a circular fitting carrying four 3-way pendants similarly illuminated. A

Electric Lighting at the Aldwych Theatre.

smaller circular fitting is installed on either side of the central unit carrying six lighting units, which are equipped with "White Osrams." Three tastefully-grouped 18-lamp circles illuminate the proscenium, and triple wall brackets with shades are used to illuminate the tier fronts and boxes. The stage lighting is effected by 40-W vacuum lamps. A ten-light fitting and two-light brackets are installed in the outer hall, six multiple-light brackets in the vestibule, eight similar brackets and two handsome standards in the grand saloon, and a 21-light fitting in the rotunda well. The whole of the lamps installed are of the Osram type.

Appointments Vacant. — Transmission-line engineer (£800), electrical machinery and transformer engineer (£500), structural engineer (£600), hydraulic engineer (£600), and five junior assistant engineers (£200), for the River Shannon hydro-electric development scheme; electrical engineer (£650 +) for the Burgh of Hamilton; general assistant engineer (£270) for the Basingstoke Corporation Electricity Department; scientific officer for research work (£250+) for the Royal Aircraft Establishment, South Farnborough; district assistant to the mains engineer (£421), for the City of Birmingham Electric Supply Department; charge engineer, for the Lancashire Electric Power Co.; assistant shift charge engineer, for St. Marylebone Borough Council Electricity Department. (See our advertisement pages to-day.)

The Association of Mining Electrical Engineers.—The annual general meeting of the South Wales Branch and the Western Sub-Branch of the above Association will be held at the Wellington Hotel, Brecon, on May 8th, when a visit will be paid to the constructional works of the Taf Fechan Water Board at Pontsticill. Members and friends will meet at the tramway depôt of the Merthyr Electric Traction and Light Co., Ltd., and proceed by motor coach to Pontsticill, thence to Brecon for tea and the meeting, returning to Merthyr.

Institution Notes.

Institution of Electrical Engineers.—Informal Meeting.—At the informal meeting on April 12th Mr. J. Coxon was in the chair when Captain P. P. Eckersley opened a discussion on "The Linking together of Wireless and Wire Communication Systems."

The Chairman announced that this was the last meeting of the Session, and stated that while the standard of the discussions had been fully maintained and the numbers attending had exceeded those of previous years, the Committee was anxious to see even larger attendances; and as the programme for next Session would be under consideration shortly, he invited members to write to the Secretary proposing subjects to be discussed, and to suggest improvements that would increase the popularity of the informal meetings.

Captain Eckersley, in his own truly informal way, then reviewed some of the applications of linked wire and wireless systems. Explaining the difficulties of the intermittent methods by simplex working and the first attempts at duplex transmission made by Captain Round, he said great difficulties arose from having large transmitting apparatus near the receiver. He described the handicaps in using land lines that had been designed for other purposes. He drew diagrams of the unique semi-automatic board at 2LO, which insured a continuous broadcast programme by rapid transfer to other lines, in the event of failure of a transmitting station. His conclusions were that the linking of wire and wireless systems was unavoidable, but however indispensable the wireless system must inevitably be, in its present stage of development he would never use wireless where a wire would serve.

Scottish Centre.—At the sixth annual meeting of the Scottish Centre of the Institution at Glasgow, the following officials were elected for the year:—Chairman, Mr. W. L. Winning; vice-chairmen, Mr. A. S. McWhirter and Mr. W. F. Mitchell; hon. secretary, Mr. Joseph Taylor; Edinburgh assistant hon. secretary, Mr. H. V. Henniker.

Gas and Electricity Undertakings.—With the concurrence of the Council of the Institution and of the National Gas Council, a joint committee has been set up with the following reference:—"To consider whether in the national interest an inquiry might advantageously be held into the possibility of closer co-operation between gas and electricity undertakings in promoting capital and fuel economy in the supply to the public of energy derived from coal," with the understanding that no reports or discussions of the committee are to be published without the consent of both Councils. The committee is constituted as follows:—Messrs. R. A. Chattock, J. S. Highfield, G. W. Partridge, C. B. Sparks, C.B.E., W. B. Woodhouse, nominated by the Council, I.E.E.; Messrs. D. Milne Watson, D.L., and W. Cash, F.C.A., Sir A. Duckham, K.C.B., Messrs. A. W. Smith and C. Wood, O.B.E., F.C.S., nominated by the National Gas Council.

Association of Mining Electrical Engineers.—The annual general meeting of the London Branch of the Association was to be held on Tuesday last at the Junior Institution of Engineers. After the formal business there was to be a lecture in the form of a kinematograph demonstration on the subject of coal screening, blending and crushing, with special reference to the belt conveyor, by Mr. F. H. F. Hampton.

Royal Society of Arts.—At the meeting to be held on Wednesday, May 5th, at 8 p.m., Mr. C. F. Elwell, B.A., will lecture on "Radio: Its Past, Present, and Future." Prof. W. H. Eccles, D.Sc., F.R.S., will preside. On the following Wednesday, May 12th, at 8 p.m., Mr. Warre S. Bradley will deal with "Industrial Welfare in Practice." Sir Robert A. Hadfield will preside.

Institute of Transport.—Congress.—The sixth Congress of the Institute will be held at Birmingham from May 13th to 15th, and the proceedings will comprise the reading and discussion of papers and various visits and inspections. The latter will include the works of Messrs. Cadbury Bros., Ltd., at Bournville, the Kyotts Lake Depôt of the Birmingham Corporation Tramways, the Curzon Street goods station, L.M. and S.R., the carriage and wagon shops of the L.M. & S.R. at Derby, and the works of the Austin Motor Co., Ltd., at Longbridge.

Among the papers to be read are "Road Passenger Transport," by Mr. Alfred Baker, General Manager, Birmingham Corporation Tramways, and "Transport in England: a brief historical survey," by Mr. C. Grant Robertson, M.A., LL.D., C.V.O., Principal of the Birmingham University.

The Faraday Society.—The *Transactions* of this Society, which have hitherto appeared three times a year, will in future be published bi-monthly in order to expedite the publication of papers presented to the Society. In addition to the six bi-monthly parts, reports of two general discussions will be published annually, one in the spring and one in the autumn. The new arrangement begins with Volume XXII, 1926.

Institute of Wireless Technology.—Dinner.—Dr. Ralph Bown, vice-president of the American Institute of Radio Engineers, is at present visiting London in connection with developments in transoceanic radio telephony. A meeting of members of all classes of the Institute of Radio Engineers resident in Great Britain and the Irish Free State has been arranged to welcome Dr. Bown, who is the director of the Department of Development and Research of the American Telegraph and Telephone Co., of New York. His address will convey information regarding developments. The date of the meeting has been fixed for April 27th, and will take the form of a dinner at the Engineers' Club. Tickets (price 8s. 6d., exclusive of wine) should be applied for at once, addressing the hon. secretary, Institute of Wireless Technology, 71, Kingsway, London, W.C.2.

Junior Institution of Engineers.—In a paper on "Automobile Lighting, Starting and Ignition," read before the Institution, Mr. T. L. Allison described the operation of the trembler coil, magneto, and battery and coil systems of ignition, and mentioned the advantages of the battery and coil system in respect of cheapness, simplicity of moving parts, and adaptability and uniformity of spark at all speeds. He also described and illustrated several types of dynamos, starters, switchboards and wiring. Mr. Allison said that the public was very quick to condemn a car because of a known defect in its electrical equipment.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

At the last meeting of the Council of the E.C.A. Allied Associations, held at 15, Savoy Street, on April 13th and 14th, Mr. H. J. Miles, M.I.E.E. (Messrs. Page & Miles, Ltd., Brighton) was unanimously nominated as president for the year 1926-1927; and Mr. W. H. Walton (Messrs. Pinching and Walton) was also unanimously nominated as vice-president for the same period. At the same Council meeting Mr. L. C. Penwill was unanimously appointed as secretary of the E.C.A. Allied Associations. Mr. Penwill acted as assistant and deputy to the late Mr. Leonard G. Tate, M.I.E.E., for six years (from 1920), during which time he acquired an intimate knowledge of all the Association's affairs and activities.

The marriage took place at Fleetwood on April 3rd of Mr. Lawrence F. Rowntree, who is in charge of the local branch of the Humber Electrical Engineering Co., Ltd., and Miss Margaret E. Fish.

Mr. G. Weeks, of G. Weeks & Son, electrical engineers, Bromley, Kent, was on April 9th presented with a Gladstone bag, a cheque for 100 guineas, which he will devote to educational purposes, and an album containing an illuminated address, a portrait of himself, and a list of the subscribers, in recognition of his long and valued public services to the town. Mr. Weeks served on the Town Council from 1903 until his recent retirement, and filled the office of Mayor from 1911 to 1913.

Mr. W. J. Cooper, acting electrical engineer at Hamilton Electricity Works, has been appointed electrical engineer for the burgh of Hamilton.

The *Financial Times* states that Mr. F. Stacey Hooker, who in 1924 joined the board of C. A. Vandervell & Co., and also acted as general manager, has now resigned his executive position, but remains a director of the company. He is joining the board of several other companies.

The *Financial Times* says that Mr. Bruce has offered Mr. Howard Gepp, general manager of the Electrolytic Zinc Company, the chairmanship of the Migration Developmental Commission at a salary of £5,000 a year, and that Mr. Gepp has accepted the position.

Mr. L. Hermes, of the Marconiphone Co., Ltd., Tottenham Court Road, W.1, has resigned his post as sales manager of the company as from April 13th.

Aylesbury Town Council has increased the salary of the electrical engineer, Mr. W. A. Turnbull, from £650 to £750.

The Dover Town Council has increased the salary of Mr. Osborn, mains superintendent, from £409 per annum to £455.

Alderman J. W. Longley, consulting engineer and chairman of the Bradford Corporation Electricity Committee, is the newly-elected president of the Bradford Engineering Society.

On April 16th Mr. Joseph Taylor, foreman of the finishing department of English Electric Co., Ltd., at Preston, who is retiring after 27 years service, was presented with a cigarette cabinet, a silver cigarette case, and a silver matchbox. Mr. Barwick, works superintendent, made the presentation.

At a social gathering held on April 15th Mr. E. Evans, who, after 30 years' service in the Electricity Department of the Southport Corporation, recently relinquished his position as works superintendent, was presented by the borough engineer, Mr. E. Moxon, on behalf of the members of the Welfare Club, with an easy chair and a framed photograph of the staff. Mr. Moxon, Mr. W. T. Gann, chief assistant engineer, and Mr. J. J. Young, works superintendent, each paid tribute to Mr. Evans's abilities.

Mr. W. A. MacKenzie, of the Charing Cross Electricity Supply Co., was entertained to dinner at Gatti's Restaurant, Strand, on April 16th, and was presented with a token of esteem from his personal staff on the occasion of his appointment to the London Power Company.

M. Maurice Le Las, the president of the Société des Téléphones Le Las and a director of the Compagnie Française Amplion, of Paris, has recently been appointed a Chevalier of the French Legion of Honour. The Le Las Co. is well known as suppliers of telephone and signalling apparatus for the French Navy, and it is in connection with this work that the honour has been conferred on its president.

The Stoke Newington Electricity Committee has recommended that the sick leave of Mr. C. S. Hann, the borough electrical engineer, be extended until May 13th, as his medical adviser reports that there is every prospect of a permanent cure being effected.

Mr. Edward Perugini recently resigned from the post of general manager of the Electrical Federation (Victoria) and, according to the *Australian Electrical Times*, Mr. W. Richards, who has had an extensive experience in the Department of Trade and Customs, the Tariff Board, and in private business, has been appointed to succeed him.

We learn that a new air record for a flight from London to the Continent was set up this week, when Mr. P. F. Berk, chairman of Messrs. F. W. Berk & Co., Ltd., chemical manufacturers and makers of the B.A.A. accumulator acid, flew 1,200 miles in 15½ hours.

Obituary.—Mr. H. Oppenheimer.—Mr. Hermann Oppenheimer, whose death, in his seventieth year, was briefly mentioned in our last issue, was for many years one of the most

The Late Mr. H. Oppenheimer.

familiar personalities in electrical trade circles in London. His connection with the industry had extended over 40 years, for in the early days of the General Electric Co., Ltd., he was associated therein with Sir Hugo Hirst and the late Mr. Byng. After that relationship he became manager of the International Telephone Co., Ltd., first at Aldermanbury and later at Red Cross Street, London. Mr. Oppenheimer was always a man of spirit, energy and enterprise, and under his direction the International Co.'s business grew until it became necessary to move to more commodious quarters; it was then that he opened a new factory at Kilburn. During this period the telephone industry was undergoing rapid development and the company's work comprised telephonic installations in the Island of Guernsey and at Glasgow. Mr. Oppenheimer's principal achievement was the foundation in 1911 of the Phœnix Telephone & Electric Works, Ltd., of which he became chairman and managing director. At a dinner held to celebrate the removal of the company into the Hendon premises, marked testimony was borne to Mr. Oppenheimer's popularity. The group of well-known electrical men who used to meet at the Hotel Cecil and other places in the old days when the National Electrical Manufacturers' Association was beginning the discussion of problems confronting the electrical trader and manufacturer, will well recall the interest that Mr. Oppenheimer imparted to its proceedings, and they will also remember the important part that he played in bringing into being the Electrical Trades Benevolent Institution. In the Electrical Review for June 2nd, 1905—nearly twenty-one years ago—the first annual meeting of the National Electrical Manufacturers' Association was reported, and it will perhaps be interesting to reproduce now the list of those who at that meeting were appointed as the committee, for they revive the surroundings in which Mr. Oppenheimer was formerly a very familiar figure:—Messrs. Bevis, Grainger, Lundberg, Nalder, Northcote, Oppenheimer, Patersen, Clarke, and H. H. Berry. Those who knew him in these and other connections will agree that he was a lovable man, always optimistic, very good company, and interested in the electrical industry as a whole, and the employés of his company will bear testimony to the personal interest that he took in their well-being. Indeed, one of the schemes which he brought into existence shortly before his death was a pensions scheme, to which the company contributed handsomely.

Mr. A. A. Brown.—The death took place, on April 7th, at the age of 48 years, of Mr. Alfred Alexander Brown, who had for many years been in business as an electrician in Church Street, Barnsley.

Mr. A. F. Lovey.—We regret to record that the death took place, on April 10th, of Mr. Arthur Feri Lovey, of Blackheath, S.E., who had for 47 years been on the electrical staff of the Telegraph Construction and Maintenance Co., of East Greenwich. Since 1880 he had assisted in laying cables in many parts of the globe.

Mr. H. A. Olive.—The death took place, on April 14th, in hospital in London, after an operation, of Mr. Henry Andrew Olive, who was in business as an electrical engineer at Sittingbourne. He was 40 years of age.

New Companies Registered.

Gravesend Welding & Electrical Engineering Works, Ltd. (213,118).—Private company. Registered April 12th. Capital, £1,500 in £1 shares. Objects:— To acquire the business of welders and electrical and general engineers now carried on by S. Levett and E. J. S. Wheatcroft at Gravesend and Northfleet, Kent. The permanent directors are:—S. Lovett, 28, College Road, Northfleet; E. J. S. Wheatcroft, 4, Park Place, Milton Road, Gravesend; E. W. Whiteman, 2, Ivanhurst, Overcliffe, Gravesend. Qualification, 400 shares. Remuneration, £30 per annum, divided between them. Solicitors: Edward Lovell & Son, Gravesend.

County Electrical Co. (Pendleton), Ltd. (213,097).—Private company. Registered April 12th. Capital, £2,000 in £1 shares. Objects: To acquire the business of an electrician carried on by T. H. Blood as the "County Electrical Company," and to carry on the same and the business of electrical engineers and contractors, dealers in electrical and wireless goods, &c. The directors are:—H. T. Blood and Mrs. E. Blood, both of Ravensfleet, Linney Lane, Bramall, Cheshire. Qualification, 1 share. Remuneration as fixed by the company. Registered office: Town Hall Chambers, Broad Street, Pendleton, Manchester.

Dri-Ac, Ltd. (213,055).—Private company. Registered April 9th. Capital, £1,500 in £1 shares (1,200 ordinary and 300 deferred). Objects: To acquire from C. G. Smith the benefit of certain existing inventions relating to secondary cells or batteries for electricity storage, and the trade mark or name of "Dri-Ac" used in connection with the sale of apparatus, &c., and to carry on the business of electric or wireless apparatus engineers, &c. The subscribers (each with one ordinary share) are:—C. G. Smith, "Woodville," Oakland Avenue, Cheltenham, Glos., electrical engineer; J. E. Mindfino (?), Avening Court, Glos., gentleman. The directors are not named. Qualification: 10 shares. Solicitor: J. G. Fishwick, 5, Cook Street, Liverpool.

The Standard Sealing-Chamber Co., Ltd. (213,144).—Registered on April 13th as a company limited by guarantee and not having a capital divided into shares, with 20 members each liable for £10 in the event of winding up. The objects are:—To acquire, develop and turn to account patent No. 200,895, of 1923, for an invention relating to improvements in and relating to the connection of electric cables to electrical apparatus, and to carry on the business of electrical engineers and contractors, manufacturers of and dealers in electrical, magnetic, galvanic and other apparatus, &c. The management is vested in an executive committee of not less than three or more than 11 members. The first members are:—British Thomson-Houston Co., Ltd., Crown House, Aldwych, W.C.2; English Electric Co., Ltd., Queen's House, Kingsway, W.C.2; General Electric Co., Ltd., Magnet House, Kingsway, W.C.2; Edward Holme & Co., Ltd., Broadheath, Altrincham; Johnson and Phillips, Ltd., Charlton, S.E.7; Mavor & Coulson, Ltd., 47, Broad Street, Mile End, Glasgow; Metropolitan-Vickers Electrical Co., Ltd., 4, Central Buildings, Westminster, S.W.; Bruce Peebles & Co., Ltd., Edinburgh; Allen West & Co., Ltd., Lewes Road, Brighton, all electrical engineers. Secretary: J. Bilsland. Solicitor: T. Trimnell, 1, Lincoln's Inn Fields, W.C. Registered office: 57-58, Chancery Lane, W.C.2.

Crow, Davies & Co., Ltd. (213,086).—Private company. Registered April 10th. Capital, £500 in £1 shares. Objects: To carry on the business of electrical and mechanical engineers, &c. The directors are:—F. G. Crow, 14, Upper Hornsey Rise, N.19, engineer; E. W. Davies, 4, Martlett Chambers, Crown Court, Covent Garden, W.C. Qualification, 100 shares. Remuneration as fixed by the company. Secretary: I. M. Chapman. Solicitors: Bernard Shaffer & Co., 57, Conduit Street, W.1. Registered office: Buchanan Buildings, Holborn, W.C.

Globe's Auto Electrical Co., Ltd. (213,163).—Private company. Registered April 14th. Capital, £3,600 in £1 shares. Objects: To acquire the business of a magneto and general electrical engineer formerly carried on by Anna Globe at Broad Lane, Sheffield. The directors are:—H. Heath, 649-651, Attercliffe Road, Sheffield, motor car proprietor; F. Simpson, address not stated; Mrs. A. Globe, 37, Alexandra Road, Chesterfield. Solicitors: Chambers & Sons, 26, Bank Street, Sheffield.

Official Returns of Electrical Companies.

Lewes and District Electric Supply Co., Ltd.—Satisfaction in full on March 22nd, 1926, of debentures dated December 30th, 1910, securing £8,800.

Debenture dated March 23rd, 1926, to secure £20,000 and bonus, if any, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Prudential Assurance Co., Ltd.

Aldeburgh Electric Supply Co., Ltd.—Satisfaction in full on March 26th, 1926, of debenture dated February 9th, 1918, securing £2,500.

Shoreham and District Electric Lighting and Power Co., Ltd.—First mortgage debenture dated March 19th, 1926, to secure £10,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: Solicitor to H.M. Treasury.

Lighting Trades, Ltd.—Two charges dated March 19th, 1926, to secure £55,000 and £95,000, respectively, charged on the company's undertaking and property, present and future, including uncalled capital. Holders: Nobel Industries, Ltd., and Curtis's & Harvey, Ltd., Nobel House, Buckingham Gate, S.W.1.

J. P. Hall & Co., Ltd.—Particulars filed of £46,666 13s. 4d. debentures authorised March 30th, 1926, constituting a specific charge on the company's freehold and leasehold property at Oldham, and a floating charge on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

"M.K." Electric, Ltd.—Particulars filed of £10,000 debentures authorised March 12th, 1926, charged on the company's undertaking and property, present and future, including uncalled capital, if any, the amount of the present issue being £4,600.

Cooke & Whitfield Wireless, Ltd.—E. P. Q. Carter, of 35, Waterloo Street, Birmingham, C.A., was appointed receiver and manager by order of Court dated March 30th, until April 13th, 1926, or until a further order.

Hayden, Ltd.—W. Reynolds, accountant, of 9, Heather Gardens, Golders Green, N.W.11, was appointed receiver and manager on March 22nd, 1926, under powers contained in debenture dated December 3rd, 1926.

G. W. M. Electrical Co., Ltd.—A. C. J. Jackson, of 43, Grafton Street, Tottenham Court Road, W.1, was appointed receiver and manager on April 7th, 1926, under powers contained in debentures dated December 24th, 1925

Maywood Engineering and Electrical Manufacturing Co., Ltd.—Mortgage or charge on the company's undertaking and property, present and future, including uncalled capital, dated March 25th, 1926, to secure £750. Holder: Lady Mills, Wentworth, Virginia Water.

Electric Construction Co., Ltd.—Satisfaction to the further extent of £3,700, on March 31st, 1926, of 4 per cent. perpetual first mortgage debenture stock secured by trust deed dated December 16th, 1897, securing £200,000.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Vickers, Ltd.

Mr. Douglas Vickers (president) occupied the chair at the annual meeting on April 15th and presented the report, which was dealt with in our last issue (p. 630). He said that the profits of the past year were sufficient to pay preference dividends and leave a margin of £18,275 to be carried forward. In the opinion of the directors it was not necessary to make any further reduction last year of the low value of assets recently taken as a basis upon the recommendation of the advisers, but considerable sums had been written off for depreciation in the accounts of the subsidiary companies. The board would probably decide to reorganise some of the other subsidiary companies to bring their capital down to a figure more in accordance with the value of their assets. Reviewing the activities of the subsidiaries during 1925, Mr. Vickers said that on the purely electrical side W. T. Glover and Co., Ltd., and the Metropolitan-Vickers Electrical Co., Ltd., had done well. The latter company had cultivated foreign business very carefully, with the result that considerably over half its orders came from abroad. Those foreign orders included some of the heaviest and most important pieces of machinery made in the country. After dealing with the prospects of the shipbuilding and armament departments, the president made reference to the Electricity Bill and said that the proposals had caused a setback in the demand for heavy generating plant. There would, however, soon be urgent necessity for new plant to meet the growing demand and to supersede the small inefficient stations which had stood so long in the way of development. He deprecated attempts to wreck the Bill and hoped that the Government would insist upon the provision of a "grid-iron" of mains for the interchange of energy between systems, and the construction of new stations to feed it. Apart from that there should be as little interference as possible with the generators and distributors of electricity. Mr. R. McKenna seconded the adoption of the report, which was carried. The whole of the directors were re-elected with the exception of Lord Invernairn, who had expressed a wish to retire.

Electric Supply Corporation, Ltd.

Mr. K. A. Scott-Moncrieff (chairman) presided at the annual meeting on April 15th, and in presenting the report (*vide* Elec. Rev., April 9th, p. 591), he said that although the energy supplied in Dumbarton and Hitchin had decreased, in all the other towns served by the company there had been progress. The result was an increase of £1,969 in the amount carried to net revenue account. The company had increased its interest in the Hendon Electric Supply Co., Ltd. The Dawlish and North Berwick Companies had not yet issued their reports. The undertaking of the latter company had been acquired by the North Berwick Town Council on March 31st last, and the distribution of its assets would give the company a considerable premium on its holding in the North Berwick undertaking. The Dumbarton Burgh & County Tramways Co. was suffering from severe outside omnibus competition. The E.S. Corporation had increased its holding of short-term notes in the company; these were secured upon the shares of the Dumbarton General Omnibus Co., which had been formed to meet the competition. Referring to the Government's Electricity Bill, the chairman said that although there were points in the measure which would affect the company adversely, it would be all to the good if the company could take bulk supplies instead of running small generating stations. In connection with such supplies, however, a difficulty arose where the undertaking was purchasable by a local authority within a comparatively short period which would not give the company time to write off the capital cost of the plant which had to be discarded. The Bill made provision for that in general terms. The Dalkeith undertaking was being purchased by the Town Council, but the Chelmsford Council had not exercised its option at the end of last year. The next purchase period would be in 1936. The company had thought it advisable to extend its operations into new fields. Accordingly, the Orders in respect of Alton, Hants., and Wellington, Somerset, were being acquired, and also that for Seaford and Newhaven when it was granted. The company had also obtained Orders in its own name for the supply in Hitchin and Exmouth, as the existing arrangements were unsatisfactory.

Oliver Pell, Control, Ltd.

Speaking at the annual meeting on April 8th, the chairman (Mr. C. Oliver) said that the profit enabled them to maintain the dividend of 10 per cent. upon both the ordinary and preference shares. The position of the company had also been strengthened by substantial allocations to depreciation and by increasing the amount carried forward. The company had been engaged on street-lighting contracts during the year employing the "Oliver" lamp. In the directors' opinion the arc lamp was superior to the gasfilled lamp for street lighting, and was sure to come into its own again. Their subsidiary, the Varley Magnet Co., had been busy during the year, as had their switch department, whose products were sold to the trade by Iok Switches, Ltd., in which company they held a controlling interest. They anticipated a great expansion in the sale of their switches, which were replacing American patterns, and to provide for this growth they were reorganising their works in all departments and providing further accommodation and facilities. They considered that the Government should extend a certain measure of protection to the industry, and were willing to fall in with Sir Field Beale's recent proposal that manufacturers should agree, in return for protection, not to advance their prices to the public.

The report and accounts were adopted.

Lanarkshire Tramways Co.

Owing to unrestricted motor-omnibus competition, the company sustained a loss of £9,848 during 1925, and to this has to be added interest charges amounting to £858. After crediting £3,183 brought forward and £5,663 from investments, a debit balance of £1,859 remains to be carried forward. In view of the heavy loss, it was necessary to reduce the wages of the staff, and this resulted in two strikes. Expenses have been reduced in all directions, but until some control is exercised over the motor-'bus services in the area, the financial results will continue to be unsatisfactory. A statement circulated with the report shows that the receipts per car mile fell from 16.86d. in 1924 to 9.57d. in 1925. In the last eleven years a total of £388,383 has been expended virtually in relief of the ratepayers, including £238,469 for road maintenance. The report records the death of two directors, Sir Bache Cunard, Bart., and Lord Carmichael, whose places have been taken by Mr. G. F. Pollock and Mr. A. Clements. Meeting: April 30th.

Bournemouth and Poole Electricity Supply Co., Ltd.

The annual meeting was held on April 15th. Mr. J. A. Hosker (chairman), who presided, said that the report showed continued progress. The expenses had been increased by heavier rates and taxes, but the increase in revenue more than balanced that. The total reserves were now £446,271, while the ordinary capital was £360,000. Mr. Hosker was of opinion that unless the Government's Electricity Bill were considerably amended it would fail to secure the development of the industry and lower generating and distributing costs. If the company could obtain a bulk supply at a lower rate than that at which it generated electricity, the opportunity would be seized. Conversely, the company would be glad to afford a bulk supply to other undertakers. He feared that there was a danger of bureaucratic control impeding progress. So far as the company's area was concerned it would appear that it was unlikely to be affected for many years.

Canadian Companies.

Canadian General Electric Co., Ltd.—The gross profits for the past year were $1,617,092 and the net profits $933,751, as compared with $578,473 in 1924. The same amount was allocated to depreciation ($600,000), but the interest charges were lower, owing to the redemption of outstanding debentures and notes; these charges have now been

entirely eliminated. The payment of dividends absorbed $553,541, leaving a surplus of $380,209, as against $66,246 in 1924. This surplus has been employed to write off the premium paid on the redemption of the debentures. The cash balance at the close of the year was $1,092,119, as compared with $816,420 at the end of 1924, and the value of investments has risen from $325,152 to $849,012.

Canadian Light and Power Co.—By an extraordinary resolution passed recently, 40 per cent. of the principal indebtedness, represented by 5 per cent. 40-year first mortgage sinking fund bonds, is to be converted into fully-paid, non-assessable shares of the common stock of the company at par.

West Kootenay Power and Light Co.—The gross earnings for 1925 were $1,041,125, as against $683,416 in 1924. After providing for interest, depreciation, renewals and dividends, a surplus of $5,238 remains, which is added to $11,374 brought forward. Last year's surplus was only $67.

Belgian Companies.

The *Compagnie de Tramways et Electricité* states that the net profits realised in 1925 amounted to 718,000 fr., allowing of the distribution of a rate of 15 fr. net per share.

The *Compagnie Générale de Railways et Electricité* reports an increase in net profits from 7,252,000 fr. in 1924 to 7,945,000 fr. last year. It is proposed to pay a dividend at the rate of 31.20 fr. net per ordinary share, as compared with 31.87 fr. in 1924.

The *Société Générale Belge d'Entreprises Electriques* reports that the net profits increased from 3,502,000 fr. in 1924 to 4,783,000 fr. last year, permitting of the payment of a dividend at the rate of 42.90 fr. net per share, as compared with 46.75 fr. in the previous year.

The *Ateliers de Constructions Electriques de Charleroi* records net profits of 7,159,000 fr. for 1925, as compared with 5,295,000 fr. in the preceding year. The rate of dividend is 15.60 fr. net per share, as contrasted with 12.75 fr. in the previous year.

German Companies.

The *Welter Electricity and Lifting Appliances Company*, Cologne, reports a total loss of 61,000 marks for the years 1924 and 1925, which is covered by an appropriation from the special reserve fund.

The *Concordia Electricity Company*, Dusseldorf, has declared a dividend at the rate of 5 per cent. for 1925.

The *Transradio Wireless Company*, of Berlin, recommends the payment of a dividend at the rate of 8 per cent. for 1925.
